

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

**Middlemarch.** A Study of Provincial Life. By George Eliot.  
Blackwood.

CONTEMPORARY criticism of great works is apt to prove unsatisfactory, for even when their greatness is recognised at once, the critic labours under a double disadvantage: an unwonted sense of responsibility restrains the free expression of unmotivated admiration, and the easy volubility of praise, which is enough for slighter merits, makes way for a guarded tone of respect that looks like coldness on the surface. Nor is this all; for the vocabulary of positive eulogium is soon exhausted; criticism to be significant must be comparative, and there is an obvious difficulty in estimating by old-established standards of excellence a new work that may contain within itself a fresh standard for the guidance and imitation of futurity. For the theory of art is after all only a patchwork of inference from the practice of artists, and, to quit generalities, in one clearly defined and admirable branch of imaginative art—the English novel—our ideal is simply one or other of the masterpieces of one or other of the great novelists between Fielding and George Eliot. *Tom Jones*, *Clarissa Harlowe*, *Waverley*, *Pride and Prejudice*, *Vanity Fair*, *Adam Bede*—to which some might wish to add *Eugene Aram*, *Pickwick*, and *Jane Eyre*—are the sources from whence all theories of the novel, as a prose narrative representation of manners, character and passion, ultimately derive. In truth, variety and intensity, the best of these works left something to be supplied by excellence of a different type: there are stronger as well as more complex passions than Fielding has drawn; Richardson's subtlety works in a narrow field; Miss Austen's knowledge of the world was scanty, and Thackeray's theory of human nature one-sided, while on the other hand it might be argued that an over-systematic plot or too thrilling situations give a *prima facie* look of unreality to scenes of modern life. No one of course makes it a ground of complaint against these authors that they failed to combine incompatible perfections, but a reference to the natural limitations of the styles in which they severally succeeded may help to show what space was left for a fresh combination of the old ingredients.

*Middlemarch* marks an epoch in the history of fiction in  
VOL. IV.

so far as its incidents are taken from the inner life, as the action is developed by the direct influence of mind on mind and character on character, as the material circumstances of the outer world are made subordinate and accessory to the artistic presentation of a definite passage of mental experience, but chiefly as giving a background of perfect realistic truth to a profoundly imaginative psychological study. The effect is as new as if we could suppose a *Wilhelm Meister* written by Balzac. In *Silas Marner*, *Romola*, and the author's other works there is the same power, but it does not so completely and exclusively determine the form in which the conception is placed before us. In *Silas Marner* there is a natural and obvious unity in the life of the weaver, but in *Romola*—where alone the interest is at once as varied and as profound as in *Middlemarch*—though the historic glories of Florence, the passions belonging to what, as compared with the nineteenth century, is an heroic age, are in perfect harmony with the grand manner of treating spiritual problems, yet the realism, the positive background of fact, which we can scarcely better bear to miss, has necessarily some of the character of an hypothesis, and does not inspire us with the same confidence as truths we can verify for ourselves. For that reason alone, on the mere point of artistic harmony of construction, we should rate the last work as the greatest; and to say that *Middlemarch* is George Eliot's greatest work is to say that it has scarcely a superior and very few equals in the whole wide range of English fiction.

As "a study of provincial life," if it were nothing more, *Middlemarch* would have a lasting charm for students of human nature in its less ephemeral costumes; besides the crowds of men and women whom we have all known in real life, where, however, to our dimmer vision, they seemed less real and life-like than in the book, the relations between the different clusters, the proportions in which the different elements mix, the points of contact and the degree of isolation in the different ranks; the contented coexistence of town and county, the channels of communication between the two always open and yet so rarely used, the effect of class distinctions in varying the mental horizon and obliging the most matter-of-fact observer to see a few things in perspective,—all the subtle factors which make up the character of a definite state of society are given with inimitable accuracy and fulness of insight. The picture in its main outlines is as true of the England of to-day or the England

of a hundred years ago as of the England of the Reform agitation. The world as we know it has its wise and good, its fools and hypocrites scattered up and down a neutral-tinted mass in much the same proportion as at Middlemarch. The only difference is that they are not so plainly recognisable, and this is perhaps the reason that a first perusal of the book seems to have an almost oppressive effect on ordinary readers, somewhat as little children are frightened at a live automaton toy. It is not natural to most men to know so much of their fellow-creatures as George Eliot shows them, to penetrate behind the scenes in so many homes, to understand the motives of ambiguous conduct, to watch "like gods knowing good and evil" the tangled course of intermingled lives, the remote mainstays of impulse and the wide-eddy effects of action. Even with the author's assistance it is not easy to maintain the same height of observant wisdom for long, and since the intricacy of the subject is real, a feeling of even painful bewilderment in its contemplation is not entirely unbecoming.

But the complicated conditions of so seemingly simple a thing as provincial life are not the main subject of the work. The busy idleness of Middlemarch, its trade, its politics, its vestry meetings, and its neighbouring magnates, only form the background of relief to two or three spiritual conflicts, the scenery amongst which two or three souls spend some eventful years in working out their own salvation and their neighbours', or in effecting, with equal labour, something less than salvation for both. The story of these conflicts and struggles is the thread which unites the whole, and sympathy with its incidents is the force that reconciles the reader to the unwonted strain upon his intellectual faculties already noticed; and to the yet further effort necessary to recognise the fact that the real and the ideal sides of our common nature do coexist in just such relations, and with just such proportionate force as the author reveals. For, without this admission, it is impossible to appreciate the full literary and artistic perfection of the work as a whole; some readers may delight spontaneously in the author's moral earnestness, and only admire her satirical insight, while others delight in her satire and coldly admit the excellence of the moral purpose; but the two are only opposite aspects of the same large theory of the universe, which is at once so charitable and so melancholy that it would be fairly intolerable (although true) without the sauce of an unsparing humour.

*Middlemarch* is the story of two rather sad fatalities, of two lives which, starting with more than ordinary promise, had to rest content with very ordinary achievement, and could not derive unmixed consolation from the knowledge, which was the chief prize of their struggles, that failure is never altogether undeserved. One of the original mottoes to the first book gives the clue to what follows:

"1st Gent. Our deeds are fetters that we forge ourselves.  
2nd Gent. Ay, truly; but I think it is the world  
That brings the iron:"

but as the action proceeds a further consciousness gathers shape: "It always remains true that if we had been greater, circumstances would have been less strong against us;" which is still more simply expressed in Dorothea's "feeling that there was always something better which she might have done, if she had only been better and known better." The two failures, however, have little in common but their irrevocable necessity. From one point of view, Dorothea's is the most tragical, for the fault in her case seems to be altogether in the nature and constitution of the universe; her devotion and purity of intention are altogether beautiful, even when, for lack of knowledge, they are expended in what seems to be the wrong place, but it is a sad reflection that

their beauty must always rest on a basis of illusion because there is no right place for their bestowal. Except in the chapter of her marriages Dorothea is a perfect woman, but for a perfect woman any marriage is a *mésalliance*, and as such, "certainly those determining acts of her life were not ideally beautiful." But we can as little tell as the Middlemarchers "what else that was in her power she ought rather to have done." If she had had no illusions she might have been a useful Lady Bountiful, managing her own affairs like Goethe's Theresa, a personage who inspires but mediocre interest, and might have married Mrs. Cadwallader's philanthropic Lord Triton without suspicion of *mésalliance*: but then she would not have been Dorothea, not the impetuous young woman with "a heart large enough for the Virgin Mary," whose sighs, when she thinks her lover is untrue, are breathed for "all the troubles of all the people on the face of the earth." The world must be ugly for her power of seeing it as it is not to be beautiful, just as men's lives must be sad and miserable to call for the exercise of her infinite charity. Still the illusions are sweet and the charity beneficent, and since women like Dorothea are content to live only for others, life may offer occasions enough for self-sacrifice to compensate them for the natural impossibility of shaping an ideally perfect course through the multitudinous imperfections of real existence. It would be ungenerous to accept such a fate for them without reluctance, and therefore some sadness must always mix with our thoughts of the historic and unhistoric Dorotheas of the world; but it is also true that the moral force exercised by such characters can no more be wasted than any physical impulse, and that, without the disinterested virtue of the few, the conflicting appetites of a world of Rosamonds would make life impossible. To keep society alive is perhaps a worthier mission than to cheer the declining years of Mr. Casaubon; but to do more than keep it alive, to make it a fit home for future Dorotheas, the present supply of such missionaries would have to be increased; and they are born, not made. Perhaps the strongest example of the author's instinctive truthfulness is that she never loses sight of the limits to the exercise of the power which she represents so vividly and values so highly. A life's growth of empty egotism like Mr. Casaubon's cannot be melted in a year of marriage, even to Dorothea; with a generous example close before her, Rosamond can be almost honest for once at little expense, but she can no more change her character than her complexion or the colour of her eyes, or than she can unmake the whole series of circumstances which have made her life less negatively innocent than Celia's. A little more selfishness, a little more obstinacy, a little less good fortune, and especially life in a just lower moral atmosphere, make all the difference between a pretty, prosaic, kittenish wife and a kind of well-conducted domestic vampire. It is by such contrasts as these that George Eliot contrives to preach tolerance even while showing with grim distinctness the ineffaceableness of moral distinctions and the unrelenting force of moral obligations. If virtue is a matter of capacity, defect only calls for pity; but defects which we do not venture to blame may be none the less fatal to the higher life, while the smallest shoot of virtue, if the heavens and earth chance to be propitious to its growth, may spread into a stately tree.

Such at least is the inference suggested by another contrast, that between Lydgate and Fred, for though marriage appears the "determining act" in their lives also, it is itself determined by certain essential points of character and disposition. Fred's honest boyish affection for a girl who is a great deal too good for him brings its own reward, as that kind of virtue often will; there was enough self-abandonment

in it to deserve a generous answer, and in the long-run people generally get their deserts. The failure of Lydgate's intellectual aspirations, as the consequence of a marriage contracted altogether at the bidding of his lower nature, is of course much more elaborately treated than Fred's simple "love-problem." Unlike most of the other characters, Lydgate does not become thoroughly intelligible till the last number of the work has been read in connection with the first: then he appears as a masculine counterpart to Dorothea with the relative proportions of head and heart reversed. But while it was abstractedly impossible for Dorothea to be altogether wise, without detriment to the peculiar and charming character of her goodness, there was nothing but concrete human infirmity to prevent Lydgate from combining the mind of Bichat and the morals of Fred Vincy. Instead of such a compound the actual and very human Lydgate is one of those men whose lives are cut in two, whose intellectual interests have no direct connection with their material selves, and who only discover the impossibility of living according to habit or tradition when brought by accident or their own heedlessness face to face with difficulties that require thought as well as resolution. There was not room in the life he contemplated for a soul much larger than Rosamond's, and it may be doubted whether the Rosamond he wished for would not, by a merely passive influence, have been as obstructive to his wide speculations, for he was just, though not expansive, and the duties entailed by one act of weakness may multiply and branch as much as if they were of a valuable stock. On the other hand, if the scientific ardour had been more absorbing, he might have gone on his own way, crushing all poor Rosamond's little schemes of opposition, and then she would have been the victim instead of the oppressor, but his character would have been as far from ideal excellence as before. The interest culminates when Lydgate, entangled with the consequences of his own and other people's wrongdoing, finds in Dorothea the beneficent influence that spends itself in setting straight whatever is not constitutionally crooked, but he has also of course found out by then that the events which led him to cross her path were the same that had proved fatal to his aspirations; the enlarged sympathies were gathered during the process that paralysed his original activity. The story of a man "who has not done what he once meant to do" has always a strong element of pathos, but when what he meant to do was not in itself impossible, like the realization of Dorothea's visions, there remains a twofold consolation; if possible in itself, and yet not done as proposed, it must have been impossible to the proposer, and therefore his failure is free from blame, while disappointment of his hopes, though painful, cannot be regarded as an unmitigated evil, since such fallen aspirations as Lydgate's are still something it is better to have had than to be altogether without. Natural fatality and the logic of facts are made to persuade us that all regrets are impractical except the most impractical of all—"if we had only known better and been better"—but the first step towards solving a problem is to state it; and one of the many merits of *Middlemarch* is that it shows the inadequacy of all other less arduous short cuts to the reformation of society. Ordinary mortals who are not fatalists have no excuse for calling a book sad which makes the redress of every one's wrongs rest in the last resort with themselves; while people whose idea of the world is already as gloomy as it well can be, cannot fail to derive some consolation from the thought that George Eliot's wider knowledge and juster perceptions find here and there a little to admire as well as much everywhere to laugh at.

There is no occasion to dwell in detail on the story which every one has read. The studies of Casaubon and Bulstrode

would each furnish matter for an ordinary review, though here we have treated them as altogether secondary to the development of the two principal characters. Besides their more direct influence on the action, both serve, with old Featherstone, to illustrate the blindness of selfish calculation. Bulstrode is none the better either for his manslaughter or for his attempt at restitution. If Mr. Casaubon's will had not drawn Dorothea and Ladislaw together, something else would; for the moral forces at work in any direction can only be arrested by other forces of the same kind, while no moral jugglery will ward off the material effects of causes set to work long before. By way of relief from such troublesome spectacles, the Garth household is invaluable, with its common-sense happiness not corrupted by an undue contempt for "notions." The choruses of slightly belated popular wisdom, the Featherstone family, Mrs. Dollop's clients, the Middlemarch tea-parties, the dowager Lady Chettam's society, appear from time to time to comment with their usual insight and *à propos* on the doings of their betters. But it is perhaps a mistake to suppose the intention of this class of character to be altogether satirical. The author spends too much invention upon them for them to be quite so stupid as they look. The minds of Mrs. Waule and sister Martha, as of Mrs. Holt and the Tulliver connection move erratically, but their reasoning is often so imaginative that it would be scarcely a compliment to suggest that they only represent, as choruses should, the opinions of the inspired *vox populi* in the process of making: they are an idealization rather than a caricature of the popular sense.

In a work that has scarcely a quality which is not a merit, it is hard to determine what points to leave unnoticed. The gift, shared only, amongst contemporaries by Mr. Browning, of choosing similes and illustrations that do really illustrate the nature of the things compared, is exercised, if anything, more freely than in the author's other works; but her style, always polished and direct, seems to have become still more sharply condensed; the dialogues, always natural, still more simple in their force. This is especially true of the scenes in the last book, where Dorothea probably uses fewer and plainer words than have ever served to express deep feeling before. Mastery like this is the best title to immortality, and posterity will only do the present generation justice if it believes that real emotion speaks so now, if it speaks at all, though in real life it more commonly observes an awkward silence. Many of the less serious conversations have the same classical perfection of finish; one, for instance, between Mary Garth and Rosamond, near the end of part i., will show to those curious in such matters better than all Mr. Trollope's voluminous works, how girls in the nineteenth century discuss the matters in which they are privately interested. The family circle of the Vincys in the chapter before is scarcely inferior, and though we only see in it now a singularly faithful sketch from nature, there can be little doubt of its outliving the nature it represents. It is a little curious that Mr. Brooke, who represents a type, should seem, according to the general experience, to be a commoner acquaintance than Sir James Chettam, who represents a class, which we should be loth to think threatened with extinction. Both are friends of whom one does not soon weary of telling, but if we had indefinite space at command it would be better spent in quoting their sayings or the author's own epigrams. Failing this resource, we can only return to the point from whence we started, the natural incapacity of criticism (or critics—"the people who have failed in literature and art") to throw much light upon a work like *Middlemarch*. All critics are not like Mr. Borthrop Trumbull, who "was an admirer by nature, and would have liked to have the universe under

his hammer, feeling that it would go at a higher figure for his recommendation." On the contrary, we hold that an auctioneer's catalogue of the divers and sundry beauties, rarities, and profundities of these admirable volumes, can add nothing to the impression which a leisurely perusal (let no one read them in haste) will leave on the mind of every man and woman whose mental and artistic perceptions are sound and unblunted. And if praise is unnecessary, it is impertinent. Spontaneous admiration is one of the few pleasures of life, but the spurious literary enthusiasm which has to be conjured up with a bedè roll of respected adjectives is a caricature of the true feeling. In fact, for the moment, we are of Sir James Chetam's mind. He has just said: "I don't *like* Casaubon." (Can anything be more conclusive? if he had said: "I *like* Middlemarch!") "He did not usually find it easy to give his reasons; it seemed to him strange that people should not know them without being told, since he only felt what was reasonable." Except by the amiable baronet, reasons for *disliking* a person—or a book—are easily found; but the best reason for an admiration of *Middlemarch* is—the book itself.

H. LAWRENNY.

**The Red Flag, and other Poems.** By the Hon. Roden Noel, Author of *Beatrice*, and other Poems. Strahan and Co.

MR. NOEL'S new volume of poems marks a decided advance both in clearness of form and in melody of expression upon his earlier collection, *Beatrice*. He has succeeded in working out more unity of style, in harmonizing his thought and feeling, and in producing more sustained effects of music in verse, without sacrificing individuality. The poems which are contained in the book before us may be roughly classified under the following heads:—(i.) Social and Political, including the satire which gives its name to the volume, the long series of studies entitled "War," which deal with the events of the Prussian-French campaign, and the exquisite little lyric called "The Children's Grass." (ii.) Domestic or Personal, to which belong "A Christian's Funeral," "Life and Death," and one or two pieces of minor importance. (iii.) Landscapes; to this section may be referred the most completely successful and characteristic poems of the whole collection, particularly "Palingenesis," "Richmond Hill," "A Sea Symphony," "A Vision of the Desert," in all of which Mr. Noel displays his peculiar faculty of infusing philosophic reflection into his descriptions of nature, of painting with the most loving minuteness, and at the same time of irradiating the whole of his picture with human emotion or with deep religious feeling. (iv.) Descriptive pieces, which owe their charm to an intensity of passionate sympathy: of this class the most remarkable are "Azrael," "The Water Nymph and the Boy," and "The Dweller in Two Worlds." (v.) Songs, among which "Eric," "Was it Well?" "Early Spring" are perhaps most noticeable. This classification, which, by the way, is not based upon the order or grouping of the poems in the volume, for they are all printed as miscellaneous, may be useful as indicating briefly the range of subjects over which the author travels. It is probably upon the compositions of the third and fourth sections that the reputation of Mr. Noel as a poet of marked originality will ultimately rest.

The piece which gives its title to the book, is a satire on the hollowness of our vaunted social security. The glare of Paris in flames is shot upon London smouldering and somnolent, with pauperism lying cheek by jowl aside of sleek ecclesiastical hypocrisy, effete cynicism, frantic and unsympathetic aristocracy. The personages introduced are a

sickly artisan and his family, a pompous dignitary of the Church, an irresponsible reviewer, a dinner parasite, a fashionable couple. Before a wretched hovel in Westminster, at the window of which the pauper leans to breathe the air, pass all the comfortable people; and scraps of their conversation, as overheard by him, are retailed to us by the poet. In the pauses of the poem, like a tolling bell, recurs the ominous refrain, "And there is *Peace* in London." This is the machinery of "The Red Flag." The situation is finely conceived and powerfully presented. The sincerity of the poet, his intense feeling for the terrible, the realism with which he has wrought every detail of his picture, and his passionate sympathy with the oppressed, make the general effect of this poem very impressive. As a satire, "The Red Flag" is by no means so powerful as it is when regarded as a highly realistic picture. Mr. Noel has neither the Juvenalian fluency of invective nor the Popian trick of satiric epigram. The force of his attack consists in the vehement intensity of his grasp on actual facts and possible consequences. In reading his poem, we seem to breathe the stagnant atmosphere which precedes a tempest:

"When Jove  
Will o'er some high-iced city hang his poison  
In the sick air."

Yet some of the merely satiric touches are powerful and pointed. The portraits of the soured critic and of the professional diner-out are both excellently bitter. Turning from "The Red Flag," we notice the same quality of passionate realism in "The Children's Grass." This lyric presents companion pictures of the Thames at Richmond and the Thames below London Bridge; of the child who in the one place—

"Chose to pull the tender stems  
Where the dew-drop lingers,  
And marvelled when the limpid gems  
Fell upon his fingers"—

And of the little artificial-flower-maker in the other, who—

"Decks the blades with glass,  
Sprinkles one and then another,  
As with dew of grass.  
\* \* \* \* \*  
Starved and very pale she seems,  
With a hollow place  
Dark beneath her eyes, how wearied,  
Lashless looking on the bleared  
Mimic grass,  
Dewed with glass!"

There is no effort, by any reflection or moral-making, to bring out the pathos of the contrast. The two pictures, carefully wrought, tell their own tale. Though "War" is unequal in conception and execution, it contains many passages noticeable for the same concentrated power of description. Perhaps the best is the lyric entitled "The Roses of Bazeilles," which was suggested by Mr. Bullock's account of rose-trees blooming among the charred and blackened ruins of the burned village.

It is in his landscapes that Mr. Noel excels. The poems of which we have been speaking hitherto owe their finest quality to enthusiasm for actual life and contemporary history: they are full of the freshness of the present, the pulses of common humanity, the sympathies of a large and loving heart. They prove that the poet need not return upon the past for material. But in "Palingenesis," and "Richmond Hill," and the "Sea Symphony," Mr. Noel exhibits a rarer quality of artistic production. These poems are steeped in thought and feeling: Nature is represented with the most minute and patient accuracy; yet each

description is pervaded with a sense of the divine mysterious life that throbs within the world, and a passionate joy is kindled in the poet by his close communion with the outer world. Wordsworth and Goethe had both familiarised us with something of the same sort. But Goethe's pantheism was more scientific, Wordsworth's more contemplative, than Mr. Noel's. We need to travel back to the *Bhagavadgītā*, or to take Walt Whitman from the shelf, if we seek to match the pantheistic enthusiasm of the climax to "Palingenesis." The promise of Mr. Noel's earlier poem in this style, "Pan," is here fulfilled. The "Sea Symphony" has less of religious thought, more of human emotion in it. Perhaps this study illustrates Mr. Noel's power of painting at its best. The successive scenes of Tempest, Calm, Twilight, and Breeze, recall Brett, Moore, Whistler, and any others among our masters of marine painting who have been successful in rendering the moods of the "howler and scooper of storms—capricious and dainty sea!" The descriptions, though minute, are not tedious, because they are full of restless movement, and vitalised with emotion so intense that the keen vision of the poet is communicated by it to his readers.

The glamour of water is rendered with wonderful felicity in the "Water Nymph and the Boy," which in many respects is the best poem in the book. Taking the legend of the Naiad who draws downward to herself and death a beautiful mortal, Mr. Noel has, by the force of his intense and realistic treatment, invested an old subject with a new charm. There is something irresistibly fascinating in the dubious fable-land that lies between humanity and nature: and this fascination has been consummately rendered by Mr. Noel, who blends the images of the water and the boy in a blaze of noonday gorgeousness. The song of the nymph at the end—

"Father and mother,  
Weeping and wild,  
Came to the forest,  
Calling the child;  
Came from the palace,  
Down to the pool,  
Calling my darling,  
My beautiful!" &c.

seems to suggest some of Weber's eeriest and frailest melodies. And to heighten the effect of this picture, Nature in her brightest mood is placed in contact with the highest product of civilisation. The boy is no mere Hylas or Narcissus, but a very high-bred and delicately nurtured young gentleman! "Azrael" is a summer-night study of the same order, in which human passion and the luxury of the world are wrought together into a shot-silk sort of splendour. A still further blending of the gorgeous in description and the passionate in feeling, with the addition of a philosophical conception, distinguishes the "Dweller in Two Worlds." This poem narrates, under the form of allegory, the experience of a soul which habitually lives in a state of division between higher and lower impulses. Harmony is in the end produced by a return to the pantheistic philosophy which lies at the root of all of Mr. Noel's thought, and which is beautifully expressed in the passage which we propose to quote. The discord of pain or sin, passing through musical modulations, until it fades into divine silence; what image better expresses a modern nineteenth-century dream of Nirvana?

"Last, while the clouds from all the mount were torn,  
In desolate lower roots of it a horn  
Resounded harsh and loud; but higher rocks  
Multiplied into most ethereal shocks  
Of melody the sound, which, as it passed  
To loftier shining regions, ever amassed

A more ideal spiritual tone;  
Till, like a delicate subtle flame, it won  
Its way to yonder battlements of ice,  
Exhaling there in silver paradise,  
As from some luminous aerial places,  
And sweet serenely modulated faces;  
Dissolving now, an overblown faint flower,  
Into a perfumed stillness evermore."

We have left ourselves but small space to speak of the minor poems in this volume. Yet it would not do to omit some notice of the elegiac sweetness of "Eric," or of the picturesque delicacy of "Early Spring," or of the wild passion of "A Lady to her Lover," or of the weird dream-atmosphere of "Death and Life," or of the quaint, old-world, musical charm which lingers about "The Old Piano." A brief quotation from this last lyric will form a fitting termination for the analysis of Mr. Noel's book. It is always well to end upon a soft and plaintive note that echoes in the memory:

"In the twilight, in the twilight,  
Sounding softly, sounding low,  
Float some cadences enchanted,  
Eerie songs of long ago.  
  
In the gloaming, in the gloaming,  
Sits our child with lips apart,  
Near her mother, who is singing,  
Near the woman of my heart.  
  
O how thinly, and how feebly,  
Rings the ancient instrument!  
When it opened, slowly yielding,  
What a weird unwonted scent!  
  
Plaining wildered all forlornly,  
As it were surprised from death;  
On a plate of faded ivory  
Some lost name faint wavereth.  
  
Wildered sorely, wildered sorely,  
In oblivion mouldering,  
To be challenged now for music  
That the dead were wont to sing!"

Here we must break off abruptly: for the poem glides along like the frail minor tones of the harpsichord, and the ghosts issue from it like those strange cobweb phantoms which Miss Claxton used to send to make us pensive in the Dudley Gallery.

J. A. SYMONDS.

### LITERARY NOTES.

The Accademia dei Lincei was occupied during its November sitting with the somewhat metaphysical question of its own identity with the famous Lincean Academy founded in 1603 by Federico Cesi, duke of Acquasparta. It was decided that, as the statutes of the modern foundation speak of it as a "revival" and "restoration" of the ancient one, the interruption of its existence does not in the least interfere with the right of the actual Academy to look upon the meritorious young Cesi as its real and only founder. The other proceedings were of some interest. The society proposes to publish a MS. *Trattato della mano dell'uomo paragonata alli piedi di alcuni animali quadrupedi e di uccelli*, written by Francesco Stelluti, one of the original Lynxes for incorporation with G. B. Porta's *Fisionomia del corpo umano*, published at Rome in 1637.

The increased political and commercial activity of which Vienna is the centre, and the Vienna Exhibition is to be the expression, has a counterpart in literary and theatrical circles. Complete editions of three distinctively Austrian writers, Grillparzer, Friedrich Halm, and the comic dramatist Bauernfeld, are either accomplished or in progress, and though matters have changed a little since Carlyle's expression of grim amazement at the space taken up by theatrical intelligence in all German newspapers, the energy and success of H. Laube's management of the new *Stadt-Theater* is still a matter of national interest. It is also asserted to the credit of the Vienna public that pieces

like *Fernande* and *La Coupe d'argent*, which succeed in Paris and Berlin, are either coldly received or actually hissed and withdrawn.

O. Hartwig writes to the *Allgemeine Zeitung* (December 10, 11) to invite Italian scholars to be on the watch for any MSS. or authentic extracts that may have formed part of a Chronicle, ascribed to Brunetto Latini, of which the earlier portion may perhaps be actually his work. Herr Hartwig failed to trace the fate of the Chronicle after the dispersion of the *Bibliotheca Gaddiana*, to which it was said to have belonged, but he has found fragments, one in MS. which he judges from the character to be certainly as old as Dante, another printed in Lastri's *Osservatore Fiorentino*, and a *Storiella antica creduta di Ser Brunetto Latini*, appended to a reprint of Brunetto's translation of three of Cicero's orations. The latter passage contains a slightly different account of the origin of the Guelph and Ghibellin factions from that of Villani and Dino Compagni. The betrothal of the daughter of Lambertuccio dei Lamberti to Buondelmonte is represented as an atonement or reconciliation after a former quarrel, and the taunt which led Buondelmonte to leave his promised bride in the lurch was that he was marrying for fear of his wife's relations, his own family having been the original aggressors. The saying, "Che cosa fatta capo a," which decided the Lamberti to take mortal vengeance for the affront is here given still less intelligibly *Che cosa fatta cappa a*, but the context shows the sense to be the same. Herr Hartwig shows from the same source that in Villani, iv. 29, there is probably the mistake of a century in the date (1113 for 1213), whence he argues to the importance of checking Villani's statements by contemporary documents.

The friends of German literature will be glad to hear that a French scholar, M. E. Müntz, has found unedited documents concerning one of the most illustrious poets of Germany whose biography has remained most obscure as yet, in spite of all researches, John Fischart. These documents are Fischart's act of marriage, dated St. Martin's day 1583, and several allusions to his family, especially his wife, who married again on the 24th April 1593 (she married J. L. Weidmann). These documents have been utterly unnoticed by the historians of German literature, Goedeke, Koberstein, Vilmas, &c., as well as by the latest editor of Fischart's works, H. Kurz. M. Müntz will soon publish these documents, and so little is known yet of Fischart's life that his contribution will be welcome.

A writer in the *Athenaeum* states that Mrs. Somerville had written an autobiography which she intended for publication after her death.

## Art and Archaeology.

Paolo Pino's Dialogue of Painting. [*Dialogo di Pittura di Messer Paolo Pino*. Venice, 1548.] Reprinted by Dr. Max Jordan. Leipzig, 1872.

PAOLO PINO, whose rare manual has been reprinted with singular care by Dr. Max Jordan, was a painter, and a contemporary of Titian. Though Venice contains none of his works, and Venetian historians seem unacquainted with his name, he claims to be of authority in his craft, and we may admit that to some extent he commands our attention and respect. It would be a mistake to confound him with his namesake of Lucca, who was a pupil of the Caracci; for Venice, according to his own statement, was the place of his birth, and Savoldo was his master; but it would be no less a mistake to consider him identical with Pino da Messina, who flourished before 1500. There is reason to believe that Pino was one of the numerous portrait-painters who lived in comparative obscurity at Venice about the year 1550. In a catalogue of the Mantova collection, which was one of the celebrated ones at Padua, the portrait of Paolo Pino by himself was hung by the side of Mantova's likeness by Titian; and there is a good bust of a physician

by Pino, with the date of 1544, in the gallery of the Uffizi. As a composer of altar-pieces, Pino's skill is moderately displayed in a Virgin and Child with four saints (1465) which still adorns the church of San Francesco at Padua. He appears to better advantage as the designer of a marble pillar which once supported the flagstaff of the republic, or of allegories with framings and ornament in the public "Loggia," in the *castello*, of Noale.

Pino was not without patrons, having induced the doge Francesco Donato to accept the dedication of his book; nor was he without friends, as is shown by his correspondence (1464) with Alvise Cornaro, the Mæcenæ of Venetian artists. His acquaintance with the literature of art was not large, and we doubt whether he had ability to master Pliny in the original; but if he took his knowledge of the ancients from translations or adaptations, he read Cennini at least in its primitive form; and it is probable that he was no stranger to the works or to the person of Vasari, both of which he mentions with approval. Vasari at that time had only written the *Lives*, and Pino could only have had them from the author. But, more than this, if we compare the pages of the *Lives* with those of the *Dialogue*, we trace the source from which Vasari derived his description—of Pordenone as a master of letters, of music, and of fence; of Sebastian del Piombo as a player of the lute, and of Savoldo as a painter of dawn or sunset scenes. A patient collation proves that Pino paraphrased numerous passages of Alberti's *Pittura*, accepting much that that essay contains, whilst rejecting much that Alberti inculcates. Casual allusions to Dürer's *Unterweisung* and Gaurico's *Sculpture* testify to some knowledge of the writings of these masters, whilst da Vinci's treatise—the best and most celebrated of its kind—is passed over in silence. Nor is it the less remarkable that this should be so, as Savoldo, who taught Pino, had been in the service of the last duke of Milan, and might have communicated to his pupil what the Lombard craftsmen of the time knew so well.

The form into which Pino cast his dialogue is loose and picturesque. He quickly tires of the strict laws of art, and wanders from a lesson in optics to anecdotes, and from these again to the true mould of beauty in females or proportion in males. In a fit of ecstasy he contemplates "design as the mistress and forerunner of all other arts, the preserver of the effigies of heroes, the mirror of the passions, the perpetuator of spring and summer, and the limner of life and death." He recovers from this rhapsody to discuss the condition of artists in his day as compared with those of antiquity, not omitting to repeat the story of Zeuxis and the virgins of Crotona, or of Apelles and Campaspe. He describes the true painter in the words of Cennini as one who is led to the exercise of his profession by a natural inclination, and not driven to it by poverty and want; he defines painting under the three heads of design, invention, and colour, subdividing these again into parts after the model of Alberti. Like Alberti, too, he affects to consider the quality, the diversity, or the effects of colours as too well known to need further elucidation, but as to practice, he lays down rules which tell how widely the range of thought in craftsmen of the sixteenth century differed from that of craftsmen in the fifteenth. It has been well observed by Anton Springer that Alberti's aim was to raise art from the slough into which it had fallen in the hands of the degenerate Giottesques. With that view he dwelt emphatically on the plastic development of form, on the desirableness of a regular distribution and pleasant diversity of figures, the charms of colour, the delights of a pure and constant imitation of nature. He wished to enforce par-

ticularly the necessity for careful drawing; and he went so far as to recommend the first sketch of a figure in its anatomical development, the second in its nude aspect, the third in its appearance as clothed in drapery. To get at detail with accuracy, he suggested the use of the *veil*, through the squares of which the position of every muscle and bone might be seen and transferred proportionally and correctly to the panel. But in the course of years the purpose of the Tuscan reformer had been attained. Art had reached that form of perfection which preceded its inevitable decline; and it was quite natural that the principles of a Florentine of Masaccio's time should no longer have applied to the taste of a Venetian of 1548.

Pino, we observe, lays stress on points altogether different from those which occupied the attention of Alberti. He thinks it desirable to be simple in variety, but one figure at least, he declares, should be set in a manner "strained, mysterious, and difficult," in order to test the master's skill. To "use excessive diligence in contour or in lining out inner forms with the help of the veil, or to model in monochrome after the fashion of Giovanni Bellini," he considers useless and so much labour lost, because "the superposed colour must in the end cover all that has cost so much time and trouble to produce." In fact, he concludes, the diligence of a master should be moderate and not extreme. He must have a facile hand and a firm touch, and disdain the use of the stick; yet he must not affect the baneful rapidity of Andrea Schiavone; and he should have patience to lay by a work of partial completeness that he may take it up again with a fresh and critical eye.

In a further discussion between Pino's interlocutors as to various methods in painting, we note how completely the influence of Giorgione and Pordenone affected Pino's judgment. He treats of the various modes of fresco, tempera, and oil; and gives judgment in favour of the first, alluding with decisive particularity "to the mistake of Sebastian del Piombo in making use of oil for mural decorations that already show symptoms of decay." At Rome no doubt the frescoes of del Piombo underwent change, and suffered from the effects of time, but at Venice frescoes hardly outlived the painters who executed them.

The purpose and utility of perspective, the origin of the invention of painting, the claims of precedence variously urged by the advocates and opponents of sculpture, are touched upon; and a list of dead and living artists, with a description of the qualities which should go to make up an ideal craftsman, completes the dialogue.

What Pino teaches may have bespoken the attention of his contemporaries; it cannot fetter ours. There is more interest in the connection of his subject with the state of art and artists at the period in which he wrote. We detect the partial favour of a disciple in the sentences in which the public is accused of being hard and neglectful to Savoldo; but it is not easy to test the justice of the remark that "few painters, if judged by their works, are acquainted with perspective." The ideal of female beauty which Pino recommends is the full and rich ideal which attracts in the canvasses of Palma and del Piombo. The strained, mysterious, and difficult figure intended to test the painter's subtlety recalls the forcible but unnatural nudes which are almost invariably found in the compositions of Pordenone and Paris Bordone. The quaint advice to composers to adorn their subjects with trophies, hangings, festoons, and friezes, or dress their personages in armour, slashes, embroideries, fringes, veils, and gems, points surely to the schools of Bergamo and Brescia, out of which Savoldo came.

When Lauro asks Fabio why painting is in less veneration and less richly rewarded than in the classic times, Fabio replies that the cause lies in the unworthiness of artists who aspire to be masters before they have ceased to be disciples, in the ignorance of patrons, the penury of painters, and the sordid character of purchasers. Poverty prevents the professional man from conscientiously finishing his works; greed prompts him to produce much and rapidly. The public does not know a canvass of Titian from one by Bonifacio; every nobleman keeps a painter of his own; and he who should wait till he is called is likely to starve. How, under these circumstances, a youthful student can be expected to live is hard to say; nor is it practicable to ask him to lay by his work for future improvement, because such advice, though it may be good for a successful master, is a mere mockery to one whose pieces are worth so little in the market. Happy indeed, he concludes, is the youth who earns a day's salary by painting chairs or chests.

It is probable that this lamentation reveals the true state to which the great mass of artists at Venice was reduced in the sixteenth century. Ridolfi says that prices were then much lower than they became in his age. Titian, he observes, lived at first in moderate circumstances, and would never have been rich but for the patronage of the emperor. Pordenone's fortune was never large. Schiavone is known to have begged for a job from the painters of chairs and tables, who were licensed by an old law to keep shops under the porticoes of the Piazza of St. Mark; and the dealers who were known under the name of *bottegai* were infamous for buying the pictures of necessitous young fellows at nominal prices. The public hardly required to give orders when they could purchase for a trifle the best works of the second or third class at the exhibitions of the *merceria*. The custom of decorating the outer walls of edifices was so general, and the number of skilled men who could carry out such decorations was so great, that no one who built a house thought of engaging any one to adorn it, the matter being usually left in the hands of the master mason, who paid the designer with the wages of a journeyman. Tintoretto was certainly not one of the lowest of his craft, but he sometimes exercised his ingenuity in the endeavour to obtain a commission for a house front. The rich man Ravagnino stared when Pordenone asked fifty ducats for covering his palace with frescoes; but he was justified in his astonishment, because other men were to be had for much less money. With art and artists in this condition it seems almost unnecessary for Pino to recommend that the rivalry of painters should be settled by a competition "similar to that which took place between Titian and Palma Vecchio for the 'Death of Peter Martyr' in San Giovanni e Paolo."

An interval of nine or ten years separates the publication of Paolo's *Dialogue* from that of Lodovico Dolce, who wrote at Aretino's instigation to challenge and, if possible, to destroy, the supremacy of Michel Angelo. Ariosto held that some painters might be excellent, but Michel Angelo alone was divine; and this sentiment was shared by Pino in common with most of his contemporaries. Nor does it seem enough for him to affirm that a model painter ought to be a draughtsman like Michel Angelo and a colourist like Titian; he condescends to notice particularly as men of promise Agnolo Bronzino and Vasari, who were the best known representatives of Michel Angelo's school in the north. It is needless to point out that in Venice as in Florence the worship of Buonarroti was the prelude to the decline of art. Daniel de Volterra's casts from the Medici monuments at San Lorenzo were in the workshops of all Venetian painters. Santo Zago copied one of them on a house front at Venice. Tintoretto studied them by lamp-

light, and wrote on the wall of his studio, "Il disegno di Michel Angelo è il colorito di Tiziano." But in striving to combine the perfection incarnate in two of the greatest masters of the modern world, the later Venetians only hastened their own fall.

J. A. CROWE.

### ART NOTES.

A correspondent of the *Allgemeine Zeitung* reports the discovery at Mantua of some frescoes apparently by the hand of Giotto. The Venetian photographer Raja happened to be in Mantua on business; he there found some works going on in an old palace of the Gonzaga family, in a chamber which had formerly served as a private chapel. The floor was strewn with painted fragments of the wall, and the business of destruction was going on rapidly. Raja succeeded in arresting the progress of the workmen, and, calling Professor Botti, of Pisa, to his aid, managed to restore the portions which remained intact, and to remove them safely from the surface of the wall. These fragments belong to two different paintings; the subject of one is the Madonna throned, attended by St. Catharine and St. Stephen (or Laurentius?); of the other, the Crucifixion. Of this latter, half of the figure of the Christ was still existing when Raja came upon the scene, but he has only been able to save an arm and three figures of angels. It is these portions which are reported to show evident tokens of Giotto's hand. He was at Padua in 1303, but nothing has hitherto come to light from which we might suppose ourselves authorised to infer that he was ever in Mantua. The remnants of this fresco must, it is asserted, be his work, and it is suggested as probable that the whole of the chapel was painted under his superintendence. The other fresco is stated to be of great historical value, but is not ascribed to Giotto; it is possibly by a pupil, who shows great force in modelling, but a less delicate feeling for form.

The sale of the paintings, drawings, and other works of art, forming the collection of M. Théophile Gautier, will take place at the Hôtel Drouot on the 14th, 15th, and 16th of January. They will be exhibited there for two days previous to the commencement of the sale.

A society has recently been formed at Paris which has for its object the encouragement of Christian art. It is entitled "Société de Saint-Jean pour le développement de l'art chrétien," and has just issued the programme of a competition which it is about to open. Artists are invited to present a cartoon representing St. John the Evangelist in some principal moment of his life. The moment is left to the taste and discretion of the competitor; the style must be that of the great epochs of Christian art, which is rather an indefinite prescription. The height of the figure must be at least one metre. The works are to be sent in on April 20, in order that they may be publicly exhibited from the 1st to the 20th of May. There are three prizes of 1000, 300, and 200 francs respectively. One of the best known names on the jury is that of M. Gaillard, the celebrated designer and engraver. The address of the bureau is rue de l'Université 47.

M. v. Gedéonow writes, in the *Allgemeine Zeitung* of December 1, a short article of comment on Herr Dobbert's notice of the group of sculpture ("Dead Child on a Dolphin") recently brought before public attention at St. Petersburg, and supposed to be executed as well as designed by Raphael. This notice also appeared in the pages of the same journal, and in writing it Herr Dobbert laid great stress on what seemed to be the weaker links in the chain of evidence which justify us in ascribing the work to Raphael. The distinguished director of the Hermitage endeavours to meet these criticisms wherever it is possible to bring a fair show of argument and probability against them, and concurs with Herr Dobbert in pressing the importance of instituting a searching comparison between the technical carrying out of the group in question with that of the "Jonas." M. v. Gedéonow evidently feels well assured that such a comparison, were it effected, could only serve to establish the reputation of the Hermitage group.

The second volume of the late Dr. Friederichs' catalogue of *Berlins antike Bildwerke* has been carefully edited by the author's friend, Dr. Weber. The volume contains the description of the small objects and bronzes in the old museum; it is no mere catalogue, but a work of high scientific merit, and fulfils the most exacting of the requirements of modern knowledge. The *Allgemeine Zeitung* for December 6 contains the commencement of a very careful critical notice of the work, the writer of which takes occasion also to give expression to the feeling of bitter regret with which all true students regard the loss which archaeological studies have sustained by the too early death of Dr. Friederichs.

A sixth edition of Sir Charles Bell's *Anatomy of Human Expression* has lately been published by Mr. Bohn. It is a reprint of the third edition, which was published posthumously, but had been previously revised and rearranged by the author, who had made a visit to the continent shortly before his death for the express purpose of verifying and testing his principles of criticism in art by study of the works of the great masters. The present edition has been carefully got up, but not one of the illustrations will for a moment bear comparison with the original plates in the first edition; the text is of course specially interesting as containing the author's last thoughts.

A translation, by F. E. Bunnett, of Dr. Wilhelm Lübke's *History of Sculpture* has been brought out by Smith and Elder. If the translator had only done his part as well as the publisher, we should have had to congratulate ourselves on the possession of a highly creditable performance. As it is, we are reduced to saying that the paper, the letterpress, the whole get-up, in short, is admirable, and the translation execrable. It is full of blunders of both sorts, blunders arising from want of knowledge of the language, and blunders arising from want of knowledge of the subject. "Zu," for instance, is rendered "to" instead of "at," so we have the citizens of Apollonia erecting a statue to Olympia. One might fill two or three pages of foolscap with a list of the really bad mistakes and ridiculous statements in which these pages abound, and for which the translator's ignorance is evidently responsible. This being the case, it is fortunate that no attempt has been made to give Dr. Lübke's text that revision of which it now stands so much in need, and which is absolutely necessary in order to fit the work for the purposes of students. A work which omits to mention in the department of ancient sculpture, the Diadumenos from Vaisson, now in the British Museum, or the sculptures from Priene, or to give the results of the recent excavations at Ephesus, cannot be looked on as making any attempt to meet the requirements of a standard text-book.

We give some of the most important of the objects sold and the prices obtained at the sale of M. F. L., which we announced in our last number. A cippus, in ivory, Italian work of the sixteenth century, depicting in bas-relief the subject of Theseus combating the Amazons, 3600 frs. Second cippus, time of Louis XIV., on which the battle of Arbela, after Lebrun, is sculptured, 405 frs. Bust of Diana of Poitiers, after the marble group by Jean Goujon in the Louvre (it is extremely doubtful that the head of the nymph in this group is a portrait), 12,000 frs. A comb of the time of Francis I., with figures, 510 frs. Another comb, an imitation of the old style, 750 frs. A bronze bust of a girl, by Saly, 1480 frs. Bust of Anius Verus, son of Marcus Aurelius, 2850 frs. The celebrated snuffbox, by Lioux de Savignac, fetched 12,100 frs.

## Physical Science and Philosophy.

## RECENT WORKS ON CHEMISTRY.

[FIFTH ARTICLE.]

XIII. Gmelin-Kraut's *Handbuch der Chemie*. Anorganische Chemie. 6th Edition. Vol. I. Part II., 1st to 4th Lieferung. Vol. III., 1st to 4th Lieferung. Heidelberg: 1871-72.\*

THERE is nothing in the appearance of a new edition of Gmelin's *Chemistry* calculated to cause dissatisfaction. That the previous edition, occupying between nine and ten thousand closely-printed pages, was no sooner completed than a new one was advertised, must be taken rather as evidence of the esteem in which it and the science it expounds are held in Germany.

The nature of Gmelin's *Handbook* is now well known. It does not propose to furnish the reader with ideas; it does not expect to be read or studied with interest, or perhaps at all. It is only for consultation. In some respects, therefore, it differs from the systems of Berzelius and Gerhardt, whose writings are interesting because they are the work of men who endeavoured to extract the essence of the facts they recorded; who, not content with results, gave also reasons and criticisms. If, however, we deduct this architecture of thought, Gmelin's *Handbook*, as a repository of facts and details with their agreements and discrepancies, is the fullest, most accurate, and most modern of all the extant systems; and every one who consults it ought to feel grateful to author, editors, and printer, for the orderly arrangement of a vast mass of materials, even though the most ardent admirer of it must admit that it is sometimes not easy to find what one wants.

But there is no doubt that a new edition was necessary, for the Inorganic division was a considerable way behind, and it was requisite to bring it down to the present time. During the twenty years which have elapsed since the first volume of the fifth edition appeared, much has been done in rearranging the elements, bringing together those which evidently form natural groups, and breaking down the distinctions, formerly rather deeply drawn, between the non-metallic and metallic elements. The improvements are the outcome of the greater attention paid of late years to the resemblances and analogies of elements and their compounds, than to their differences: the latter having been fostered by the spirit of analysis which dominated in the chemistry of the earlier part of the present century, the former being the result or accompaniment of the synthetic investigations which are now more prevalent. Important also are the changes which have passed, or are passing, over chemical theory, and which have had an influence on the descriptive part of the science.

When, therefore, it was announced that the modern combining weights would be adopted in the sixth edition, we anticipated that the whole work would be thoroughly revised, so that not only would the discoveries recently made be inserted in the proper places, but the more conspicuous defects of the previous edition, even on its own plan, would be removed.

One of these defects was the want of arrangement in the description of the sources of, and methods of preparing, different substances. Thus, the sources of oxygen, to take the first body on the list, are set down apparently at random. There is no general statement as to the bodies which yield it; there is no classification of any kind of the reactions by which it is produced; and there is no indication as to the

best sources of it. Before one can be certain that a given substance will yield oxygen, one must turn over and examine several pages, on the chance of getting the information. The sources of iodine afford another instance of this unsystematic gathering of facts. It should not be forgotten that when a philosophical classification is impracticable, there is the alphabetical upon which to fall back.

Another defect, or at least an anomaly, exists in the arrangement of the non-metallic elements. That which the author gives (5th ed. i. 480) is electro-chemical: he begins with the most electro-negative elements (oxygen, fluorine, chlorine) and ends with the most electro-positive (boron, carbon, hydrogen), while nitrogen is put by itself. But when he comes to describe the elements he entirely reverses this order; for after disposing of oxygen he steps to the other extreme, hydrogen, and works backwards to fluorine, concluding with nitrogen. The result is that all the conventional arrangements and nomenclature are more or less disturbed. The compounds of the electro-positive elements appear under the electro-negative: for instance, the sulphides of phosphorus are to be found, not under phosphorus, as one might expect, but under sulphur; chlorides of sulphur, not under sulphur but under chlorine; and so on.

Granting that oxygen, hydrogen, and nitrogen, from their character, require exceptional treatment, it is not obvious what gain there is in the transposition; and there is nothing to bridge the gap opened by it between the author's and others' text-books, and between the two divisions of his own.

It is somewhat disappointing that in these particulars there is not the smallest difference between the fifth and sixth editions. The very same classification of the non-metallic elements is retained, almost word for word, although the electro-chemical theory is no longer dominant; the same inverted order is kept, oxygen, hydrogen, then carbon, boron, phosphorus, as before. Consequently under phosphorus one gets the oxides, but for the analogous sulphides one has to refer to sulphur.

To exclude tellurium, arsenic, and silicon at least from the non-metallic elements, as is still done, is now considered erroneous, but, in truth, the elements should have been arranged according to their generic characters, and the distinction between metals and non-metals dropped. It is true that to arrange the material according to current views would have cost more labour; but it would have less required the pen than the scissors, and the result would have been freedom from incongruities. It is pleaded that to accommodate those acquainted with the previous edition the old order has been retained. No doubt, had this been modified, comparison between the editions would have been rendered more difficult, if not impossible. But, on the other hand, those likely in future to use the sixth edition will be trained in the most modern chemistry, and will have small occasion ever to refer to the fifth. When Gmelin designed his work he adopted the views current in his time; had the editors modified the plan to suit the subsequent developments of the science, they would only have followed his example, and it is much to be regretted that they have not employed their experience in making their new edition as perfect as one can expect any system to be.

When we pass from these general features to more detailed examination of the work, we find that its modernisation is rather superficial. The combining weights and formulae, and the account of entirely modern researches, are of course modern, but in nomenclature, classification, and so on, the dregs of the old system are obvious. With respect, however, to the addition of new facts, very great changes have been made, and yet their introduction has not

\* Since the above was written, the conclusion of Vol. I. Part II. and another section of Vol. III. have been received.

disorganized the work. Here it is, where possibly the absence of ideas shows to advantage, just as advantageously as the absence of bibliographic theory from the catalogue of a library. The facts in Gmelin's handbook are not unlike the specimens in a physiological museum. Each one is bottled up by itself, and has perhaps a bleached and lifeless aspect, or, by loss of spirit, has become somewhat shrivelled. Taken together, they may illustrate some general principle, but it is easy to shift them to and fro, to put new ones where the old stood dingily, to relegate these to the lumber room of history, or to put an end to them altogether.

On some such principle as this the editors have acted in preparing this edition, so as to make it modern, and to keep it within reasonable compass. In it the inorganic chemistry still to be nominally in three volumes, but volume i. is in two divisions. The first is to deal with general principles, and is to be entirely revised by Dr. Naumann. No part of this has appeared. The second division contains the non-metallic elements, and is half completed. Volume ii., containing the alkaline, the alkaline earthy, the earthy and brittle metals, is still wanting; but of volume iii., which treats of the rest of the metals, the first four parts, containing the metals from zinc to iron, have been published.

In the portion occupied by the non-metallic elements there are improvements. Thus, certain properties which were formerly treated of in the general introduction are now given along with the other properties of the substances. Among these may be mentioned combining weight, vapour density, refractive index, and some others. On the other hand, some properties are transferred to the introduction.

Everywhere in these parts one meets with additions: numerous new sources of bodies have been opened up, new methods of preparation have been devised, many points left vague by the older chemists have been re-examined and well defined, revisions of particular properties and reactions by recent experiments have supplanted the earlier results.

Of the elements which have been reinvestigated and with success, the principal are carbon, sulphur, phosphorus, and iodine. The researches of St. Claire Deville and Berthelot upon the different states of sulphur have extended the account of that element from six pages in the fifth edition to nineteen in the sixth, and there is a similar extension in the case of phosphorus by the labours of Schrötter, Hittorf, Blondlot, and others. Several of the compounds of these elements have likewise been closely scrutinized and new results have been obtained. In particular, the sections may be specified upon the phosphides of hydrogen, the polythionic acids and the sulphophosphorus compounds. The constitution of the phosphites and of the iodates and periodates as explained by Rammelsberg and others has received full justice of the editor: but he has not mentioned that the assumption of these so-called condensed acids is not universally agreed to. This may have been excluded on account of its remote likeness to criticism.

It is impossible of course to enumerate all the changes which have been made; they will be found on almost every page. There are, however, one or two sections in general which must be referred to because they might have been more fully dealt with. The most striking is the literature of the science, which is meagre in the fifth, and remains much the same in the sixth edition. Again, the main sources of some of the elements might have been enumerated. Nothing is said about the distribution of oxygen, hydrogen, sulphur, phosphorus, carbon, boron, though lists occupying nearly five closely-printed pages of the different springs, plants, animals, and minerals in which bromine and iodine have been found, are given. No allusion is made to the recovery of sulphur from soda waste, and no list is given of the

substances by which oxygen is absorbed at ordinary temperatures.\*

About entirely new bodies there is very little to say. No new class of compounds has been discovered, and comparatively few single bodies: the most important of these are ozone, oxysulphide of carbon, and graphitic acid. There are besides the selenides of phosphorus, seleniothionic acids, the oxides of iodine, perbromic acid, and a few others. The views relative to flame propounded by Frankland as a correction of Davy's are given, the absorption of hydrogen by metals, the various corrections introduced by Stas in the course of his determination of combining weights, the results of Bunsen's experiments on the solubility of gases in water and other separate investigations of importance are duly recorded.

But if altogether new bodies are rare, additions to our knowledge of known bodies are abundant, as we have already said; in some cases enough to lead to considerable modification of opinions already held. The number of these shows how activity chiefly prevails in checking previous work, and in obtaining precise information where the older investigators were baffled in their attempts. In reading these descriptions one sees how the names of Berzelius, Liebig, and others gradually give way to those of less known men, who, having the advantage of recent improvements and carried on by the spirit of the time, are able to amend and widen the older researches, and thus to dominate as authorities in the present.

This comparison of these two editions, separated by so short a period, is interesting on another account. One sees thereby how observation shifts from one object to another, how those which were of great importance twenty years ago have set for the time, and have had the account of them curtailed in the new edition. Catalysis, for example, which occupies many pages in the previous edition, is reduced to a few paragraphs in the present.\* On the other hand, objects, which were just on the horizon formerly, are now in the zenith; and chemists who do not join in contemplating them, will hardly get credit for doing useful work, on whatever other object their gaze may be fixed. Ozone, which was mentioned doubtfully and indirectly in connection with electricity, has, during the interval, been so largely examined that it has acquired as much importance as ordinary oxygen. Following this, the various states of the elements have been minutely investigated, as will be seen by reference to carbon, boron, sulphur, and phosphorus, the varieties of which bodies are a little bewildering, especially when one does not know whether the experimental physical differences are sufficient evidence of essential chemical difference. All these phenomena are of recent discovery, so recent that in the fifth edition the term allotropy, now in regular use to denote the facts, appears on trial merely. For a similar case the discussion in the fifth edition on Wurtz's theory of the basicity of phosphorous acid, of the nature of an anhydride, &c., may be referred to. These doubtful views have since prevailed, and have given rise to investigations which have brought new compounds to light. Perhaps the most striking is the decision with which Graham's explanation of the phosphoric acids is given in the present edition. Propounded a little earlier than 1852, it is not accepted unqualifiedly in the fifth edition, but is discussed as if it were not yet quite confirmed. More especially as an extension of Graham's view, and as a deduction from atomicity and chemical structure, may be remarked the attempts to formulate the complex basic and anhydrous

\* It is possible, however, that the account of catalysis may be transferred to the introduction, to be treated at length as a general condition of chemical action.

salts, such as the borates, pyrophosphates, sulphates, iodates, and periodates.

The theory, by which the character of these salts is elucidated, was unknown less than twenty years ago, and it has not yet been subjected to thorough-going criticism. It is not unreasonable therefore to suppose, that it will have passed the meridian in less than twenty years hence, and have gone as completely out of view as the electro-chemical theory, which had more of experiment and less of hypothesis for its foundation.

As far as it goes then, this new edition exhibits no falling off in fullness and accuracy; but it is a compromise, and it is to that extent temporary. Works which are purely modern will have the advantage in the meantime, though otherwise not so good. Sooner or later it must be entirely remodelled, and since the editors have seen fit at present merely to supply deficiencies, they may be able to take advantage of the delay to become the first expounders of a quite new arrangement of chemical natural history, based upon the next phase of chemical theory.

In general appearance the work is much improved. The figures of crystals are now printed along with the description, instead of being given on a separate plate at the end of the volume. There are no figures of apparatus.

We may hereafter avail ourselves of the appearance of the subsequent sections to point out novelties and improvements, or what may seem to be the reverse.

J. FERGUSON.

### Correspondence.

#### TO THE EDITOR OF THE ACADEMY.

Exeter College, Oxford,  
December 3, 1872.

SIR,—In the Notes of Scientific Work of the *Academy* of November 1 (vol. iii. p. 412) there is an abstract of a paper by Dr. A. Künth on *Pteraspis*, in which evidence is brought forward to establish a view as to the nature of the organisms included under that term, contrary to that which I (confirming by more extended study the views of Agassiz, Salter, and Huxley) have put forward in my monograph of the *Cephalaspidae*, published by the Palaeontographical Society. It is to me a cause of two-fold regret that Dr. Künth has perished in the Franco-Prussian war, for not only have we thus lost a chance of obtaining additional knowledge of the Berlin *Cyathaspis*, but I shall be unable to obtain from him the admission that his conclusion is not in accordance with the facts. Nevertheless, I am bound to point out how valueless is the evidence of Crustacean affinities for *Cyathaspis* adduced by him, and how firmly, on the other hand, it is established that the *Heterostraci*—or genera *Pteraspis*, *Cyathaspis*, *Scaphaspis*—are the remains of fish. 1st. The minute structure of these shields or cephalic plates is a very peculiar one, having a striated, a cancellous, and a laminate stratum. In the three genera it is beyond all doubt established that the structure is identical, as Dr. Künth admits. The same kind of origin must be assigned to the plates of all three genera. Hence, if *Pteraspis* be the remains of a fish, so are *Cyathaspis* and *Scaphaspis*. This position, I believe, is unassailable, and was admitted by Dr. Künth. 2nd. A specimen, most carefully figured and described in my monograph now in my possession, but which I shall shortly place in the British Museum, shows seven rows of rhomboid scales attached (not merely adjacent to) a portion of the head-shield of a *Pteraspis*. That these are true scales or lozenges of sculptured calcareous matter is absolutely certain: it is also absolutely certain that the shield is Pteraspidian, and that the scales and shield belong to the same individual organism. This is clear from the figures drawn by Mr. Fielding, and cannot be doubted without charging both him and me with gross misrepresentation. 3rd. The scales are fish-like. I know of no Arthropod, nor any other organism except a Fish, which possesses any structure even remotely representing them. The shells of *Chitonidae* and *Cirrhipedia* are the only animal structures, except the scales of a ganoid fish (with which they agree exactly), which they could even vaguely suggest. Hence the *Pteraspis* shield was borne by an organism which

bore also scales like those of a fish: that is, a fish or fishlike animal. And what is true of *Pteraspis* is from paragraph 1 shown to be true of *Scaphaspis* and *Cyathaspis*. 4th. In figs. 8, 9 of pl. vii. of my monograph restorations of the form of the shield of *Pteraspis* are given, which are not hypothetical or schematic, but simple copies of the parts preserved in various specimens, some nearly perfect, also figured in the work. The form of his shield, and its details as to apertures, processes, &c. agrees with the view that it belongs to a fish most fully. It has not the remotest suggestion of crustacean affinities about it. Hence again, and by quite independent evidence, we have the piscine nature of *Pteraspis* indicated. Hence by paragraph 1 we have also additional warrant for considering *Cyathaspis* to be piscine.

Turning now to Dr. Künth's material, consisting of shields undeniably referable to my *Scaphaspis* and *Cyathaspis*, I find—if I may judge from his by no means carefully finished drawings—nothing which can be seriously put in the balance against the above incontestable demonstration of fish-like characters. If Dr. Künth's evidence did warrant his inferences as to crustacean affinities, it could not affect the facts cited above. We should have to regard the Pteraspicians as organisms combining the characters of fish and of Crustacea. But the evidence offered is really ludicrously insufficient. These shields occur often enough, crowded together in a slab of stone. Dr. Künth picks out two shields, accidentally brought into contact with certain most vague and irregular fragments placed near them—not by any means attached to them—and upon these raises a theory. The specimen, if we may judge by the figure, cannot really cause a moment's serious doubt in the mind of any person acquainted with the character of those figured in my monograph.

Whilst there is simply no scope for discussion upon the question of crustacean affinities raised by Dr. Künth, the possibility of the organic association in the same individual of the shields which I have assigned to the genera *Scaphaspis* with those assigned to *Cyathaspis*, and in other individuals with those assigned to *Pteraspis*, is altogether another matter. I myself carefully suggested this possibility, and mentioned the association of some of the forms, which suggestions Dr. Künth quotes from me. I do not think Dr. Künth's specimen bears any characters which should modify my view of the matter. There is nothing which leads to the notion that the two shields he figures were organically connected; and I have—dealing with an enormously larger body of material—pointed out in my monograph a number of facts which have led to an opposite conclusion.

A few months since I received from Herefordshire a specimen of a heterostracous shield, which is new, and is distinctly intermediate between *Pteraspis* and *Scaphaspis*. This I hope soon to figure and describe in the *Geological Magazine*. The rostrum is well developed, but is not distinctly marked off from the rest of the shield as in *Pteraspis*, nor are the cornual regions and apertures developed. This new specimen furnishes a timely support to the view that in *Scaphaspis* we have the same essential parts as in *Pteraspis* reduced or rather undeveloped.

E. RAY LANKESTER.

#### TO THE EDITOR OF THE ACADEMY.

December 10, 1872.

SIR,—In a review of Prof. Balfour's *Palaeontological Botany* in the *Academy* for October 1 (vol. iii. p. 370) I have referred to Prof. Oliver (*Natural History Review*, 1862) as having shown the greater probability of the American features of the European Tertiary vegetation having been derived from the east, rather than, with Unger and Heer, from the west. I wish to say, in answer to a communication that I have received, that I had fully in view Prof. Asa Gray's earlier (1859) and classical paper on the same subject. Prof. Oliver had however discussed the palaeontological evidence most in detail, and especially in reference to Heer's *Recherches sur le climat et la végétation du pays tertiaire* (1861), in which the Atlantis theory is vigorously maintained. For my purpose it was therefore most convenient to cite Prof. Oliver's essay.

W. T. THISELTON DYER.

### Notes of Scientific Work.

#### Geology.

**Vesuvius.**—Mr. Wyndham, in a communication (December 2) to the Ashmolean Society of Oxford, pointed out the following results of

scientific interest from the late eruption. 1. Palmieri's view was confirmed that the visible effects are not the true commencement of the eruption; the initial period (the beginning of January in this case) being indicated by the shocks after a period of comparative quiet, evidenced by appropriate instruments. 2. Two minor craters formed below the Observatory were not explicable on Palmieri's theory as the result of eruptive force in the lava itself, but were, Mr. Wyndham believes, in connection with the principal eruptive source, with which they had the same periods of activity. 3. There was some evidence of the existence of diurnal maxima and minima. The eruption began at 3.45 A.M. on April 26; it attained its maximum at 3.25 on the afternoon of that day; and he thought there was also a maximum at 3 P.M. on the 27th. 4. The study of volcanic "bombs" was likely to lead to important mineralogical results; they often presented minerals externally which, it was clear, must have been formed by the action of heat in the presence of steam from the silicates of the lava and the constituents of the included rock.

**The Coal Formation of Wyoming.**—Professor E. D. Cope describes in a paper recently read before the American Philosophical Society, Philadelphia (*American Journal of Science and Arts*, December, p. 489), a large Dinosaurian, discovered during the past summer at Black Butte Station, on the Union Pacific Railroad, in Wyoming Territory. Professor Cope remarks that the determination of the affinities of this Saurian proves that these coal-beds belong to the Cretaceous series, and not to the Tertiary. Professor Cope was doubtless not aware that Mr. Meek had in 1871 referred Dr. Hayden's collections from this formation at Bitter Creek to the Cretaceous; and that he had also referred to it in 1870 the coal-bearing rocks of the same great series at Coalville, Utah, and at Bear River City, Wyoming. Indeed as long back as 1860 Mr. Meek, in connection with Mr. Engelmann, referred Captain Simpson's collections from these rocks to the Cretaceous. Two fossils only, from one part of the formation mentioned, were identified by Mr. Meek as Tertiary, but this was from a misapprehension in regard to the locality and stratigraphical position of the Hallville coal mines, which he supposed to be twenty to thirty miles farther eastwards, and at a much higher horizon; these fossils (the only species found at Hallville) are just such forms as might be either Tertiary or Cretaceous.

**On the Last Great Glacial Period in New Zealand.**—Captain Hutton read a paper on the last glacial period of New Zealand and the formation of the Wakatipu Lake at the Wellington Philosophical Society, September 17. In opposition to the views of Dr. Hector and Dr. Haast, he attributes the formation of the terraces so common in the valleys in the South Island to marine action, advancing the view that New Zealand has been submerged beneath the sea since the valleys were eroded by glaciers, the former extension of which he attributes solely to extreme elevation of the land during a preceding period, considering the view expressed by Dr. Hector that there has been a reduction of the area of land above the snow line by the erosive action of the glaciers as unnecessary and exaggerated. Speaking of the Canterbury plains, the author stated that Dr. Haast's sections show that they are nearly level in a line parallel with the coast between the Rangitata and the Waimakiri, and that the gravel formation wraps round the spurs of the hills at the same level that it has at the river gorges. He considers that these facts, and also the occurrence of vegetable deposits below the gravel of the plains, are readily explained by supposing these to be of marine origin, and quite inexplicable on the river formation theory. Another proof of recent elevation is the fact that the glaciers are now advancing and overriding their terminal moraines. The absence of striae on the rock surfaces the author considers to be a strong proof that the glaciers were extended during the Pliocene and not during a more recent period. The origin of deep lakes, taking Wakatipu as a type, and the sounds on the west coast were next discussed, with the view of proving that their formation is not due to subsidence or unequal depression, but only to the scooping out of the rock by glaciers.

### Physiology.

**Amount of Carbonic Acid excreted by the Skin in Man.**—Dr. Hermann Aubert, of Rostock, contributes a paper on this subject to the last part of *Pföger's Archiv* (vol. vi. part xi.). The results obtained by previous experimenters upon this point are somewhat discrepant; Gerlach, in 1851, estimating it at 8 or 9 grammes in the twenty-four hours, from the whole surface of the body; Reinhard, in 1869, at only 2.23 grammes; while Scharling, in 1845, estimated it at 5.7 grammes. Aubert has made fresh experiments with modern appliances, and has placed the subject in a close box accurately adapted to the neck, but with tubes for the adit and exit of air attached to it; the latter, of course, being again connected with apparatus for the analysis of the air containing the products of the cutaneous transpiration. The general result at which he has arrived is that in the course of twenty-four hours a maximum amount of 6.3 grammes (97.272 grains), a minimum of 2.3 grammes (35.512 grains), and a mean of 3.87 grammes (59.7528 grains) of carbonic acid are eliminated from

the whole surface of the body below the neck. If to this be added that of the head, he thinks the entire quantity may be reckoned at 4 grammes, or a little more than one drachm or 60 grains. The temperature causes considerable variation; in the above experiments it was about 30° Centigrade, or about 86° Fahr. Experiments made directly with a view to determine the effects of temperature showed that at 29° 6 C. the amount of carbonic acid eliminated was 2.9 grammes; at 30° C., 3.24 grammes; at 31° 1 C., 3.78 grammes; at 31° 3 C., 3.84 grammes; at 32° C., 4.7 grammes; and at 33° C., 6.3 grammes. When compared with the total loss of carbonic acid in the twenty-four hours by the lungs, which amounts to 900 grammes, the proportion thrown off by the skin may be almost disregarded.

**Circulation in the Spleen.**—Olga Stoff and Sophie Hasse, of St. Petersburg, give an account of their researches on the circulation of the spleen in the *Centralblatt* (No. 48). Two views are entertained upon it. On the one hand, it is believed by many, as by Billroth, Schweigger-Seidel, and Kyber, that the blood path is a closed one, or, in other words, that the arteries break up into capillaries, which again reunite to form the veins. Others, as W. Müller, hold that the arteries discharge their blood into lacunar spaces, from whence the veins arise. Stoff and Hasse support the latter view; their experiments were made on the spleens of the pike, frog, salamander, duck, pigeon, fowl, sparrow, falcon, guinea-pig, rabbit, squirrel, and mouse, as well as of man, and they are decidedly of opinion that the smaller vessels break up into lacunar spaces into which the blood corpuscles pass.

**Researches in Bone and Cartilage.**—Under this heading, Dr. C. Heitzmann gives the results of many observations in the last part of *Stricker's Jahrbücher*, completing that journal for the year 1872. He describes carefully the character of the cells of healthy bone, for the examination of which he recommends the lower part of the femur of the rabbit both fresh and preserved in Müller's fluid. The canaliculi and their anastomoses, he says, can be well seen in portions of bone from which the lime salts have been removed by lactic acid. He enters fully into the microscopical characters of inflamed bone. In such bone the solution of the calcareous salts takes place first in the immediate vicinity of the vessels. The areas free from lime have sharply defined contours, which often correspond to the limits of the bone-cell territories, though they are often also independent of them. In the further progress of the inflammation, the cell-bodies enlarge, and their nuclei divide, the matrix at the same time melting down, both along the contours of the vascular canals and in the centre of the bone quite independently of the vascular canals, leading to the formation of cavities. Lastly, a differentiation of tissue takes place of the substance of the enlarged and now free bone-cells, part forming a yellow homogeneous, highly refractile substance, and another part a colourless, finely granular substance. In regard to the formation of blood in inflamed bone, he coincides with the statement long ago made by Rokitsanski, that in certain diseased conditions processes take place in molten cells which lead on the one hand to the formation of capillary vessels, and on the other to blood corpuscles. From his researches on hyaline cartilage, he finds that the bodies of the cartilage cells possess radiating processes which by their anastomoses with each other form a delicate varicose network in the matrix. These processes are very broad and large at the points of transition of the hyaline cartilage into the striated fibrous cartilage and into the periosteum. He then describes at length the effects of injuries to cartilage.

**The Kombé Arrow Poison.**—This poison is obtained from the *Strophanthus hispidus*, and is used by the natives of Africa. Dr. Livingstone gives some account of it in his *Narrative of an Expedition to the Zambesi and its Tributaries*. In hunting, he says, the natives follow the game with great perseverance and cunning. The arrow making no noise, the herd is followed until the poison takes effect and the wounded animal falls out; it is then patiently watched till it drops, a portion of meat round the wound is cut away, and all the rest is eaten. The physiological characters of the poison have recently been investigated by Dr. Fraser, of Edinburgh. The plant has been examined by Prof. Oliver, of Kew, who has named it *Strophanthus hispidus*, and finds that it belongs to the poisonous order *Apocynaceae*. Dr. Fraser concludes that the poison acts primarily upon the heart, and produces as the final result of this action paralysis of that organ, with permanence of the ventricular systole. Pulmonary respiration continues in cold-blooded animals for several minutes after the heart is paralysed. The striped muscles of the body are acted on, twitches occur in them, their tonicity is exaggerated, and finally their functional activity is destroyed; the muscles being hard, and soon after acid in reaction. These changes are accomplished subsequently to the final effect upon the heart, and are the result of a direct contact of the substance with the muscles themselves. The reflex function of the spinal cord is suspended soon after the heart is paralysed, but the motor conductivity of the spinal cord and of the nerve trunks continues after the striped muscles of the body are paralysed. The lymph hearts of the frog continue to contract for many minutes after the blood heart has been paralysed.

## Botany.

**Fertilisation of Abutilon.**—Fritz Müller has described the fertilisation of different species and varieties of *Abutilon*, which are of special interest from the facility with which hybridization occurs in that genus. The author's observations were in opposition to those of Gärtner that "artificial fertilisation of pure species generally produces a smaller number of seeds than natural fertilisation." Müller found, on the other hand, with several species which he was able to investigate, that in the natural condition, although the stigmas were freely pollenised by the agency of insects, yet a comparatively small number of seeds came to perfection, while artificial pollenisation almost universally produced a much larger number of seeds. In another point also Müller's observations are at issue with those of Kölreuter, Herbert, and Gärtner. These three observers all maintained that, when a pistil was pollenised simultaneously by the pollen of two different foreign species, both were not efficacious, but only the one which had the closest relationship to the female plant. Müller, on the other hand, records, without hesitation, the simultaneous production of hybrids between one species and two others, the pollen of which was applied to it at the same time.

**Structure of Parnassia.**—Gris, whose recent death is a heavy loss to French botany, recurs (*Mém. de la Soc. de Cherbourg*, tom. xvi.) to the question of the peculiar structure and arrangements of the stamens in *Parnassia palustris*. A large number of botanists, including Humboldt, De Candolle, St.-Hilaire, and Le Maoût, have stated that these are specially contrived for self-fertilisation. C. C. Sprengel had, however, pointed out as long ago as 1793 that the indications are rather the reverse, the anthers casting their pollen outwardly, so that it is almost impossible that any of it can fall on the stigma, which, moreover, is not mature until a considerably later period—a view supported by Vaucher and by A. W. Bennett (*J. Linn. Soc. Ap.* 1869). Gris entirely confirms this latter view. He also supports the statements of the last-named writers that the stamens gradually lengthen while in close contact with the pistil, and do not in turns approach it, like those of *Saxifraga*, as is usually stated in botanical text-books.

**The Origin of the Spanish Chestnut.** Ettingshausen discusses (*Sitzungsber. der k. Akad. der Wiss.* of Vienna, 1872 div. 1) the ancestry of *Castanea vesca* (the sweet or Spanish chestnut). In the fossil flora of Leoben, not only the leaves, but even the male catkins, of a species of *Castanea* are found, in such a state of perfection that the anthers can be recognised. The form of the leaves, &c. being very variable, these have been described as several species of Cupuliferae from the Tertiary formations. Of *Castanea atavia* (Ung.) we have also remains of the spiny husk and of the fruit. The leaves of this species pass over gradually into those of *C. vesca*, those obtained from the newer formations showing a gradual approximation to the present type; and hence our present species appears to be a lineal descendant from the *C. atavia* of the Tertiary. *C. Ungeri* (Heer) from Greenland, and *Fagus castaneaefolia* are the same species, which must have had at one time a very wide distribution. Seventeen nature-printed plates illustrate the variation in the leaves.

**Fossil Plants of the American Tertiaries.**—Lesquereux, in a supplement to the fifth report of the U. S. Geological Survey, points out (*American Journal of Science and Arts*, 1872, p. 495) the close connection between the Tertiary American Flora and that at present existing. This is especially indicated by the fossil plants of the Green River station (referable to the Upper Miocene). Besides species of *Salix*, *Amyrica*, *Rhus*, and *Ilex*, intimately related to species now existing, there is an *Ampelopsis* and *Morus*, indicating by their marked affinity the origin of the existing widely distributed Virginian creeper and red mulberry.

**Peloria in Labiatae.**—Peyritsch continues (*Sitzungsber. der k. Akad. der Wiss.* of Vienna, 1872) his researches on abnormal regularity in the flowers of Labiatae. The preponderating occurrence of quaternary types in the apical and lateral regular flowers he considers to be in contradiction to the assumption of a primary quinary type in this order. The assumption that the four stamens and the constant reversion to fours in the pelorian flowers represent an original quaternary type has the advantage of simplicity; and the number and position of the flower-leaves is then in accordance with the almost invariable arrangement of the leaves and bracts, which only on the rarest occasions depart from a cruciform and decussate position.

**Influence of Foreign Pollen on the Parent Plant.**—Asa Gray adds (*American Journal of Science and Arts*, December 1872) another to the already numerous instances which have placed this mysterious phenomenon beyond dispute. An apple (spitzenberg) produced a fruit half of which was (at least as to the surface) spitzenberg, the other half russet. A tree of the latter fruit stood about two hundred yards off. The division into two exactly equal parts is quite unexpected; as the styles and carpels were five, we should have expected the division to be into fifths. Moreover, the action of the pollen in this case is, morphologically, on the calyx, not upon the pericarp.

**Stamens replacing Ovules.**—Godron (*Mémoires de la Société de Cherbourg*, vol. xvi. p. 120) has described a double-flowered *Petunia* in

which the ovules were replaced by anthers. The pistil occasionally also presented as many as three, four, or five carpellary leaves instead of two, the normal number. The flowers of *Petunia* become double by the conversion of stamens into petals; a certain number of the stamens, however, usually continue polleniferous, and their pollen is stated, when used to fertilise single-flowered plants, to determine the production of an abundant progeny of plants with double flowers and varied colours.

**Remarkable Aroid.**—Mr. Bull has flowered (for the first time in the Old World) at King's Road, Chelsea, *Godwinia gigas*, the remarkable Aroid brought from Nicaragua by Dr. Seemann. It only produces a single leaf, and after this has died off the inflorescence makes its appearance. In the middle of December the dark chocolate-purple spathe was 1 foot 10 inches long, and was supported on a mottled peduncle measuring 1½ foot.

**Structure of the Flowers of Welwitschia.**—Professor M'Nab communicated to the Linnean Society (December 19) his observations on the development and structure of the flowers of *Welwitschia* which he had studied in specimens communicated to him by Dr. Hooker. He considered the male flower to consist of four series of opposite and decussating parts. The two outer form a perianth, which is succeeded in order by two primordial stamens, each of which subsequently branches into three, and by two carpels, between which is the undeveloped extremity of the axis. In the female flower the two inner parts of the perianth, the two primordial stamens, and the two carpels are not developed. The extremity of the axis which becomes the "nucleus" of the naked ovule is surrounded ultimately by a circular integument. Strasburger differs from Professor M'Nab in considering that the stamens form two whorls, one whorl consisting of two stamens, the other of four. This conclusion, after re-examining his specimens, Professor M'Nab is unable to agree with, as also with Strasburger's view, founded on the analogy with *Ephedra*, that the outer leaves of the female flower are carpels. *Welwitschia*, he considers, makes a very close approach to the Argiosperms, the axis of the flower ending in a mass of tissue which in the female is the terminal ovule.

## History.

ROLLS SERIES AND CALENDARS OF  
STATE PAPERS.

Higden's Polychronicon. Vol. IV. Ed. J. R. Lumby.

THE value of this edition consists in the two Old English translations which accompany the Latin text, that of Trevisa (born 1342, died 1412), and that of the Harleian MS. 2261, for they represent to us the English of the fourteenth and fifteenth centuries. A very short extract will show the difference. "There burgeys were i-woned to stonde and loke aboute and telle here mery tales. Lucanus seith, in the feelde that hatte Marcius, at the grete feste, i-made sette the hedes of gentil men that were i-slave in stede of messes uppon the mete bordes. Marius was so cruel that meny men hadde levere slee hem self than come in Marius his honde. Therefore Catulus the consul drank venym, and Merula, Jupiter his owne bisshop, kutte his own veynes, and bledde anon to dethe." (Trevisa.) "... where the citesynnes were wonte to sitte and talke. And as Lucanus reherseth he causede the hedes of the noble men of Rome, in a feste that he made, to be served to hym and to be sette on the table. The cruelnesse of Marius was soe grete that many men hade lever to sle theym selfe then to putte theyrne in his mercy. Wherefore Catullus the consul drunke poyson, and Merula the byshop Jovialle bledde to dethe thro the kyttenge of a veyne." (Harl. MS.) Much of the preface is perhaps superfluous, as a discussion of the relations of the original sources to each other is needless when we only want an edition of the Universal History popular in England in the Middle Ages, with the two accompanying translations. A very full English vocabulary ought to accompany the last volume of the work.

Letters and Papers, Foreign and Domestic, of the Reign of  
Henry VIII. Vol. IV. Part II. Ed. J. S. Brewer.

THE preface and index to volume iv. are yet to come, in a third part, so that as to the second part we need say little more than that it contains the papers of the years 1526-1528. We have now therefore reached the times of the Divorce. There are many details about the founding of "Cardinal Colleges" at Oxford and at Ipswich by Wolsey, and about the monasteries suppressed for that purpose, lists of receipts from lay and clerical subsidies, the detail of the victualling of Calais, a number of papers showing the popular feeling, and much other valuable material. The vast mass of despatches to and from the Emperor and Francis I. and the Pope in these eventful years we must reserve for consideration till the editor gives us his long expected preface. The abstracts in all the series are now given somewhat more fully than at first, much to the advantage of the historical student.

Calendar of State Papers, Domestic Series, of the Reigns of Elizabeth and James I. Addenda, 1580-1625. Ed. Mary Anne Everett Green.

It shows the need of a new arrangement of the Records that such an amount of additional documents should have been discovered. The searches have now, however, "been so exhaustive as to leave no probability of further discoveries of importance. The Domestic Calendars may therefore be considered as completed from 1547 to 1625." The Historical Commission may, however, still find much historical matter, especially correspondence, of importance—since in old days leading statesmen often kept the State Papers of their office,

and some of their descendants may do as Lord Shaftesbury has lately done, and give their ancestors' papers to the State again. The contents of this volume are of course very miscellaneous. There are a number of papers about Jersey and Guernsey and their old customs. Very many documents about the Roman Catholics at home and abroad are calendared, and the editor has given fuller lists of the names than before. There is a "Statement, addressed by Sir Fras. Bacon to the King, of the Chancery cause, Giles and Eliz. Warren v. W. Waller, relating to the lease of a house, which has been seventeen years in Court." New College men may be interested in a suit by Hum. Wickham to get his two younger sons admitted to Winchester, and thence preferred to New College, and there admitted as of the blood of the founder. Secretary Walsingham's apothecary sends him medicines of a curious character; part of a unicorn occurs among them "for resisting poison which may be tried on animals to whom arsenic has been given." "he has also silver medals, idols of Isis taken from mun. mies." The index is very good, e.g. many curious articles are mentioned under "Books," "Oxford," and similar headings.

## The Calendar of Malmesbury.

IN Hampson's *Medii Aevi Kalendarium*, i. p. 435, seq., a calendar is given, from the Cotton MS., Titus D. xxvii., which evidently belonged to a Saxon monastery, but which Hampson could not further identify. But the entries and obits show that it was the *Calendar of Malmesbury*, e.g. at June 5 and 10 are "dedicatio Basilicae Sanctae Mariae," and "dedicatio monasterii Salvatoris Mundi," which prove the point; see William of Malmesbury's *Gesta Pontificum*, v. § 197; and similarly the mention of Abbots Aelfwine and Byrhtold; and the burial of Wulfnoth, at October 18. The calendar was composed just after 1012, as the mention of S. Alphege shows; but the obits inserted range late down in the eleventh century. Hampson has only given part of the obits. It would be worth the while of the Wiltshire Archaeological Society to copy and publish it with full annotations. At January 3, Boca is a misreading for Boia. Brother Aelsinus, who wrote it, uses an easy cipher, formed by substituting the following consonant for each vowel, e.g. Aelsknxs mf scrkp-skt = Aelsinus me scripsit. A complete volume of mediaeval English calendars, carefully edited, would be very instructive.

C. W. BOASE.

The History of Sicily to the Athenian War; with Elucidations of  
the Sicilian Odes of Pindar. By W. Watkiss Lloyd. With a Map.  
Murray.

MR. LLOYD's name is so well known in connection with his reconstructive criticism of the accounts left us as to the grouping of the figures in ancient works of art that a parallel attempt to reconstruct the grouping of the ideas in Pindar's Epinician Odes, by means of a careful study of the varied relations of the Sicilian colonies with the mother country, is peculiarly welcome. He begins with a sketch of the earliest views of the Greeks about Sicily, as represented in the *Odyssey*. When the Greeks on their way back from Troy attempt to round Cape Malea, the fatal north winds carry them away, some down to Egypt, some on a long voyage among the wonderlands of the West. Men are so fond of localising old national stories that it is no wonder if various spots on the shores of Italy and Sicily were soon identified with those visited by Ulysses. Mr. Lloyd well points out that the account of Scylla and Charybdis, however exaggerated, is but a heightened study after the natural scene, and that this shows a certain amount of local

knowledge which must have been acquired from the information supplied by actual voyagers, Greek or Phœnician. Indeed, it is not improbable that the early discoverers of the rich lands of the West purposely exaggerated the dangers and horrors of the route to keep away competitors from the silver mines of Spain, or the tin and amber countries of the North. The account, too, of the cannibals does not now seem so strange after the late discoveries of the caves of such tribes on several coasts of the Mediterranean. The Cyclops Polyphemus, "vast as a mountain in bulk that peers above all others" (*Odys.* ix. 191), who throws huge rocks into the sea, is partially identified by Mr. Lloyd with a personification of Aetna as a volcano, and he ingeniously works out this idea in explaining the story of his struggle with the stream-god Acis for the sea-nymph Galatea, since the lava often injures the rivers. But we may remark on this that Aetna is believed to have been, like Vesuvius, long dormant, and its first eruption in historical times is dated, somewhat vaguely, "in the time of Pythagoras," some time after the Greek colonies had been founded in Sicily, and Humboldt (*Cosmos*, i. note 213) refers *Odys.* xii. 68, 202, 210, to Stromboli—*πρὸς τ' ὀλοοῖο θιέλλαι*. But allowing that the poets of Homer's time had a vague knowledge of Sicily, the voyage further west admits of no identifications. Scheria, the land of the Phœacians, cannot possibly be Corcyra; Welcker has even ventured to identify it with Britain. It is curious that the later Greeks of Constantinople knew so little of Britain that Procopius' island "opposite to the land where the ghosts are ferried across the straits" is as unreal as the realm of Alcinoüs.

From this discussion, our author proceeds to examine the accounts of the foundation of the successive Greek colonies, since Pindar's frequent allusions to the ancestry of his heroes and their connection with the leading heroic and sacred families of the mother countries are inexplicable without a minute knowledge of these subjects. Dissen did great service in pointing out that Pindar did not introduce legends arbitrarily into the Odes, but that traditional connection with the native country or concerns of the victor was an indispensable characteristic. Yet even Dissen did not always succeed in tracing this out in detail. Thus in an ode written for Hiero, descendant of a colonist from the isle of Telos (near the Triopian promontory of Caria), who was an hierophant of the Chthonian or subterranean gods (the very name Hiero probably alludes to the sacred functions of this family), the references to Thessalian stories are explained by Mr. Lloyd as due to the early connection between Thessaly and Caria in religious matters; and it is this Thessalian connection that brings in the traditions of Lacœria and the Centaurs, and probably also the set of traditions as to Asclepius (whose worship at Cos and Cnidus was so renowned), since Pindar places the birth of the god at Lacœria, on the Baebian Lake, and he was educated by Cheiron on the Magnesian mountains. In fact, the feeling of colonists for the mother-land was nowhere so intense as among the Greeks, independent as the colonies so generally were in a political sense. A prize at the Olympic or Pythian games, a recognition by the united representatives of the Hellenic race, an ode from one of the great poets which would be to them fame and immortality, was to them of inestimable value; they had thus won, or recovered, or vindicated, their place among those noble clans to whom Pindar ascribes all excellencies of mind and body as theirs by hereditary right. And this brings us to another point in which Mr. Lloyd seems right as against the commentators. Many of the moral remarks are often supposed to be intended as admonitions to Hiero and others, good advice, that is, to a tyrant, warnings against oppression, arro-

gance, avarice, and the like. But Mr. Lloyd points out that it would be the height of inconsistency to suppose that Pindar could introduce into an ode intended for public performance, and intended to be a glory and delight for the victor, any such reflections either upon Hiero or upon his friends or those he affected and favoured, as could not but be distasteful and disagreeable to him, and perhaps to most of those who were present. On the contrary, the poet often seems to be guarding him from cavil or open attack, speaking indirectly as of attacks that had been made on himself. Envy that assails the victor has not spared the poet, and he denounces his own calumniators with violence to make colourable the keenness with which he apprehends the injustice of like kind done to his patron—so he introduces occasion for enunciations as to how malice may be fairly coped with, and mischief turned back upon its authors.

The work is thus mainly an account of the great families of Gelo and Hiero, which took the lead in the early times of Sicily, and of the odes of Pindar written in their honour; each part of the discussion throwing light on the other. All the Sicilian odes are translated, and have separate introductions; and notices of the architecture and coinage of the island are, as we should expect from our author's previous writings, often brought in with good effect to illustrate his main subject. And we cannot but express our gratitude for his abstinence from anything like an array of learned references, and for the clear and pleasant English of the book.

C. W. BOASE.

### *Contents of the Journals, &c.*

*Bulletino dell' Istituto*, November, describes the remains of the Aedes divi Julii, just discovered close to the temple of Castor and Pollux in the Forum. It had a platform in front (in which the beaks of the ships taken at Actium were inserted), from which Augustus spoke the funeral speech on his sister Octavia, and Tiberius that on Augustus.—Some inedited inscriptions from Athens follow, and a very curious Doric one from Selinus, which shows that the temple in which it was found was an *'Απολλώνιον*. It begins, *Διὰ τοὺς θεοὺς τοὺςδε νικῶντι τοὶ Σελινούντιοι*, and then follows the list of Sicilian gods.

*Gött. gel. Anzeigen*, November 6.—Geiger continues his notices of recent works on the Humanists, this time taking Beatus Rhenanus, the friend of Erasmus, and similarly disposed towards the Reformation; and the whole of the number of December 4 is devoted to Durand de Laur's *Érasme, précurseur et initiateur de l'esprit moderne*, of which the reviewer judges somewhat unfavourably.—November 6 also contains a second notice of Hehn's *Kulturpflanzen und Haustihere* (already reviewed at length in the *Academy*, vol. iii. pp. 309-313), with especial reference to the physical circumstances that condition the growth and spread of the various plants mentioned, e.g. as to the early existence of the chestnut in Europe.—Friedländer's *Codex Traditionum Westfalicarum* and Grotefend's *Handbuch der historischen Chronologie des deutschen Mittelalters und der Neuzeit* are also reviewed; the latter does for Germany what Sir H. Nicolas' *Chronology of History* does for England.—November 20.—Sloet's *Urkundenbuch* of Guelders is reviewed by Waitz; and Ewald's *Die Eroberung Preussens durch die Deutschen*, by Perlbach; and Voigt's *Die Geschichtschreibung über den Zug Karls V. gegen Tunis* (1535).—November 27 has interesting notices of Tieftrunk's book on the opposition of the Bohemian Estates to Ferdinand I. in 1547; of d'Ovidio's attempt to show that the nouns of the Romance dialects derive their oblique case not merely from the Latin accusative, but from other Latin cases as well, and of Grundtvig's *Danish National Ballads*.

The *Mémoires de l'Académie des Sciences morales et politiques de l'Institut de France*, tome xliii., contains historical notices on the lives and works of Savigny, de Tocqueville, and Victor Cousin, by Mignet, and a number of valuable reports on the competing works examined in the various sections of Philosophy, Morals, Political Economy, Jurisprudence, and History. One of the reports in the latter is by Guizot, on the subject of the States-General. The volume is worth especial notice.

The companion volume, *Recueil des Discours, Rapports et Pièces diverses lus dans les Séances de l'Académie française, 1860-1869*, deuxième partie, contains (1) The Discours de Réception from 1866, e.g.

of Prevost-Paradol on succeeding Ampère—to which Guizot replies ; of the Abbé Gratry on succeeding Barante—to which Vitet replies. (2) The Discours sur les Prix de Vertu. (3) Villemain's reports on the competitive works from 1866. (4) Papers by members of the Academy ; two very interesting ones by Prevost-Paradol.

### Philology.

La Légende athénienne. Étude de Mythologie comparée. Par Émile Burnouf, Directeur de l'École française d'Athènes. Paris : Maisonneuve et Cie.

IN this "Study of Comparative Mythology," M. Burnouf has done good service to a science of very modern growth, by bringing to bear upon it the light afforded by careful and minute local research. His position at Athens has given him unusual facilities for the task, but it is to be hoped that others will be found to follow his example, as opportunity may be given them, in other parts of the world, so that the theoretical conclusions of the comparative mythologist may, by degrees, be thoroughly tested, as well as illustrated, by observing the modifications which the various myths have undergone from local considerations, and the influence which they have exercised on local religion.

The myth which naturally plays the most prominent part in the research of M. Burnouf is that of Athene, the patron goddess of Athens, and especially, as he shows, the tutelary deity of the Acropolis ; which contained at least four shrines dedicated in her honour, as well as the three famous statues of Athena Polias, Athena Parthenos, and Athena Promachos. Starting with complete acquiescence in the views of Professor Max Müller as to the origin of the myth, which identifies Athene etymologically with *Ahanâ*, the Aurora of the Veda, and looks upon the goddess as the impersonation of the dawn, he works out its details with considerable minuteness, in respect both of the leading characteristics of Athene herself, and of her relations, on the one hand, with Zeus, her father, the heaven, from whose face the dawn appears to spring, and on the other with Poseidon, the producer of water. This latter god is in India, as in Arcadia, essentially the god of the waters of heaven, and so closely akin to, and sometimes scarcely distinguishable from, Zeus Ombrios ; but in Greece he is generally connected with what to the Greeks was the more important realm of water, and so to them is the Ocean God. It is, however, in the former capacity that he comes especially in contact, or rather in collision, with Athene : the special enemy of the dawn being naturally the monarch of the clouds. To sum up the legend in M. Burnouf's words :

"In respect of the daughter of the heaven, at the side opposite the horizon, there is another great deity who presides over the celestial ocean. The world is in dispute between these two powers : the one brings light and activity to the living beings which it contains ; the other strikes the celestial mountains (*i. e.* the clouds), makes the waters

gush out, and opens the way to the divine horse whose movements Aurora controls. After the struggle, the god that causes the waters to flow communicates fertility to the earth, which, becoming his bride, gives birth to the plants and animals. So Aurora presents herself daily at the gates of heaven ; peaceable or ready for combat, according as the sky is pure or cloudy. If it is pure, she is calm, serene, triumphant. If it is cloudy, she is a warrior driving far before her the deity who governs the waters, and forcing him to show his divinity by the blows which he endures, or the blessings which he bestows."

In all this, M. Burnouf is playing the part of a comparative mythologist pure and simple. It is true that he illustrates his points by reference to varieties of the legend as found at Corinth, Troezen, or elsewhere ; and especially by contrasting the myth of Poseidon as it occurs in Arcadia with the modification of the same legend at Eleusis. In the former he is the cloud-god, wedding Demeter-Erinnys, herself a deity of heaven, probably to be identified with the dawn. In the latter Demeter has become the earth, and her consort, the father of the mysterious damsel, is Zeus, the empire of rain being now transferred to him from Poseidon, whose kingdom is there found in the watery plains of ocean. But all this might have been worked out from materials accessible at a distance from the scene of action : and the especial value of M. Burnouf's book lies rather in his careful and ingenious explanation of the facts of Athenian topography with reference to the myths.

Of this, the most striking example is found in his second chapter, on the astronomical facts of the Acropolis. It had been observed by previous writers on the subject, though by comparatively few of them, that, while all the temples on the Acropolis had in the main an easterly direction, yet none of them face due east, and, moreover, that hardly any two of them have their axes parallel to each other. Previous maps and plans, with the exception of those by Mr. Penrose, are singularly inaccurate on this point ; and even he looks on the irregularity as interesting rather from the great beauty which it produces, in not only obviating the dry uniformity of so many parallel straight lines, but also giving exquisite varieties of light and shade, than because it is based on any scientific principle.

M. Burnouf, however, has endeavoured, and with considerable success, to show that this variety of direction is not arbitrary, but dependent on a principle similar to that which guides the orientation of Christian churches, and that the object in view was that the portico of each temple, and consequently the image of the deity within its shrine, should face the dawn on the day of the chief festival which it was intended to commemorate. It would have been more satisfactory if he could have proved his point with regard to the other temples also ; but in respect to the Parthenon, the most illustrious of them all, his observations coincide remarkably with his theory.

He shows in the first place that, while the Grecian States generally regulated their year in accordance with one or other of the solstices or equinoxes, at Athens the summer solstice was the only one of these four dates which could reasonably be selected as the starting-point for the year, since on that day only of the four was the actual sunrise visible from the Acropolis. On all the others it was hidden by the intervention of some neighbouring height ; but on that day it was visible through a gap between Pentelicus and Hymettus, so little higher than the Acropolis that the defect was approximately corrected by refraction. On the shoulder of Hymettus, at this lowest point, there is at present the monastery of St. John Kunigos, on the site of an old temple of Apollo Kunios (which surname M. Burnouf elsewhere shows to mean "the son of the Sun"), and a line drawn from the altar of Athene Parthenos to the sunrise at the summer solstice in 445 B.C., the presumed date of the

foundation of the present Parthenon, would exactly have passed through the site of this temple. The inference that this consideration decided the site of the altar of Athene is confirmed by the fact that another temple, of Zeus Hymettios, is known to have stood on the crest of Hymettus, to the south-east of Athens, exactly in the line between the altar and the sunrise at the winter solstice; and even more remarkably by an alteration in the site of the Parthenon itself from that of the older building on which it approximately stands. The change of position was noticed by Mr. Penrose and other travellers, but has hitherto been unexplained. M. Burnouf shows that it was rendered necessary by the variation of the angle formed by the ecliptic with the equator in the interval between the two buildings; since it was necessary to move the altar of Athene, and consequently the temple, so far to the north that the line between it and the sunrise at the summer solstice should still pass through the lowest point of Hymettus. Acting on this hypothesis, he finds that the alteration of position exactly corresponds to the variation of angle between 445 B.C. and 554 B.C., the date of the second administration of Peisistratus, to which time Mr. Penrose and others had already attributed the older building on architectural grounds.

But though these facts account satisfactorily for the position of the altar, yet we are met with a difficulty on finding that the temple, though situated directly behind the altar, so that a line which is actually traceable from the statue of the goddess to the altar passes through the centre of the portico, does yet not face the actual dawn, its axis forming an angle of  $6^{\circ} 55'$  with the line from the altar to the temple of Apollo Kunios. This discrepancy is explained by M. Burnouf by the fact that the angle formed by the axis of the temple with the due east and west line exactly corresponds to the least zenithal distance of the sun in 445 B.C.; so that the direction of the temple is really determined by an independent consideration, but is equally referable to local solar phenomena.

In this way M. Burnouf confirms the belief, derived from philological considerations, that the worship of Athene is closely connected with the dawn; and shows that to that fact we are to trace the peculiarities in the position of at least her principal temple at Athens. If the data on which he grounds his arguments are not extensive enough to be absolutely conclusive, they are at least suggestive of further investigation; and we may hope that much light will in future be thrown upon the labours of the comparative mythologist, by similar intelligent contemplation of the myths in the concrete form which they assume in individual localities.

J. R. KING.

**Rig-Veda-Samhitā.** The Sacred Hymns of the Brahmans; together with the Commentary of Sāyaṇāchārya. Edited by F. Max Müller, M.A. Volume V. Published under the patronage of the Rt. Hon. H. M.'s Secretary of State for India in Council. Allen, 1872.

**The Taittiriya-Samhitā.** [Herausgegeben von Albrecht Weber. *Indische Studien*, Vols. XI. and XII.] Leipzig: 1871-72.

SINCE 1846, when Dr. R. Roth, now professor at Tübingen, published his essays on the *Literature and History of the Veda*, and thereby introduced a mass of new and brilliant light into the comparatively neglected field of enquiry opened through the researches of Colebrooke and Rosen, that branch of Hindu writings has received a steadily growing amount of attention at the hands of European Sanskrit scholars. To the general public, whose interest in Oriental literature has at no time been of a very enthusiastic kind, such historical and linguistic problems as are connected with the Veda, and the solutions proposed from time to time of some

of these, may seem but little attractive; but the student who deems it not unworthy of a lifetime to attempt to decipher the history of his race as reflected in its language, its thoughts, and its manners, and he who makes the origin and growth of language itself the sole object of his study, have long since learnt to consider the Veda as one of the primary documents for their enquiries.

The collection of hymns which constitutes the *Rig-Veda-Samhitā*, on account of its greater antiquity and purely literary character, has naturally claimed the lion's share of critical examination; and ever since Friedrich Rosen had published his *Rigvedae Specimen* (London, 1830), and his edition and translation of the whole of the first *Ashtaka*, consisting of 121 hymns (1838), there was among Sanskrit students and comparative philologists a growing demand for the entire text of this collection. At the same time the correct interpretation of these hymns was found to offer considerable difficulties to those whose knowledge of Sanskrit was derived from the literature of later times, when the dialect in which they were composed had in some degree become obsolete. It was, therefore, highly desirable that the aid afforded by native commentators should become generally accessible; the more so as there seemed reason to believe that the explanations offered in modern comments were but the latest redactions of the traditional exegesis carried on from remote ages through an unbroken succession of teachers. This meritorious, though arduous, task was accordingly undertaken by Dr. Max Müller, who, in 1849, after five years spent in collecting materials, published the first volume of his edition of the Rig-Veda hymns, together with what seems to be the only complete commentary preserved to our days, the *Bhāṣya* of Sāyaṇāchārya. The editor's confessions in his *Chips from a German Workshop* have since made us acquainted with the circumstances under which this magnificent work was permitted to see the light, thanks to the enlightened patronage of the Court of Directors in former, and the Secretary of State for India in our own, days. Three more volumes followed in 1852, 1856, and 1862 respectively; each looked forward to most eagerly by Sanskrit scholars, and imparting fresh vigour to Vaidik researches. After a more protracted interval the fifth volume, containing the whole of the ninth and about one-fourth of the tenth, or last, books, has now been issued. This delay, as Professor Müller informs us, has to be accounted for partly by the new course his studies had to take after his appointments successively to the chair of Modern European Literature and that of Comparative Philology in the University of Oxford; partly by a natural desire on his part to make known the results of his enquiries, and to contribute his share to the interpretation of the first outpourings of the Aryan mind. Besides, the difficulties which attend an edition of Sāyaṇa's comment increase considerably towards the end of the work, where omissions and mistakes become more and more frequent, and the restoration of the correct readings often hopeless. These circumstances combined seem even to have for a time endangered the completion of the work. So unsatisfactory a termination of this undertaking would certainly have been regretted by all who take an interest in these studies. Long as European scholarship may have outgrown the teachings of Hindu commentators in the interpretation of the Veda, the material assistance which their honest efforts have hitherto rendered towards a correct understanding of the poetical effusions of their forefathers will and can never be forgotten; and it is by this edition of Sāyaṇa, more than by any other work, that the name of Professor Max Müller will ever rank foremost among Vaidik philologists.

The value of the present volume is enhanced by the first

part of a complete *index verborum* of the Rig-Veda, which will no doubt prove extremely useful to all those who are engaged in the interpretation of these hymns. The unconditional adoption of the *pada*-, or detached, form for this purpose has certainly its inconveniences; but most of these will probably be removed by the scientific glossaries promised by other scholars. Besides, another valuable supplement, viz. an *index* of the *uttarapadas*, or last members of compound words, which, it is expected, will follow in the concluding volume, will supply at least some of the wants alluded to.

The literature of the *Yajurveda* has found its chief and most zealous cultivator in Professor Albrecht Weber. The *Vājasaneyi-Sanhitā*, the textbook of the White, or younger, branch of the Yajus, was published by that scholar, together with *Mahidhara's* commentary, in 1852. This edition was followed, in 1855, by the *Satapatha-Brahmana*, and, in 1859, by the *Śrauta-Sūtra* of Kātyāyana; both accompanied with extracts from commentaries. These works, as the one noticed above, were published under the auspices of the Court of Directors of the East India Company. As to the editor of Sāyana we are indebted for an edition and translation of the *Rikprātishākhya*, so Professor Weber has supplied us, in the fourth volume of his *Indische Studien* (1858) with the text and translation of the *Prātishākhya* of the Vājasaneyins. The same scholar has now completed an edition, in the Roman character, of the *Sanhitā* of the Black, or ancient, branch of the Yajus, occupying two consecutive volumes, the eleventh and twelfth, of his valuable series. Naturally much less interest attaches to the text books of the Yajus, being composed of sacrificial formulas and of verses taken for the most part from the *Rig-Veda-Sanhitā*, than may justly be claimed by the latter collection. Still, Professor Weber has done a good service to Sanskrit scholars in publishing the *Sanhitā* of the only Veda of which a complete edition did not hitherto exist. The *Taittirīya-Veda* has been studied extensively in Southern India, where, as Mr. Burnell informs us, the younger branch of the Yajus is all but unknown. An edition of this *Sanhitā*, together with Sāyana's comment, was commenced as far back as 1854 by the late Dr. E. Röer, in the *Bibliotheca Indica*. Though this is actively carried on at present by the Calcutta pandits, only about one-half of the work has been published, and it will probably take many years longer before it is completed. For this reason Professor Weber, in his edition, has added some extracts from the commentary on particularly interesting passages of the later portion of the text. He has also been able, for the first time in the publication of a *Sanhitā*, to refer throughout to its corresponding *Prātishākhyaśūtra*, viz. to the *Taittirīya-prātishākhya*, published by Professor Whitney, of Newhaven. The present edition contains besides a *résumé* of the ritualistic employment of the several sections, according to the *Kāṇḍānukrama*, the text of which is also given; and an alphabetical index of the beginnings of the *rich*, or verses, and the sections, or *anuvākas*, not of the *Sanhitā* only, but also of the *Taittirīya-Brahmana* and *Aranyaka*; additions which will greatly facilitate reference to these texts.

J. EGGLING.

#### THE LATE MR. EDWIN NORRIS.

THE death of Mr. EDWIN NORRIS, on the 10th of last month, leaves a gap in the small band of English Orientalists, which, we fear, it will not be easy to supply. He was born October 24, 1795, and in his youth spent several years abroad in the capacity of a private tutor. His first appointment was a clerkship in the India House; he afterwards became one of the interpreters to the Foreign Office, and his services in this capacity were acknowledged by a small pension, which enabled him to devote the last ten years of his life entirely to his

favourite studies. The post however with which his name more readily associates itself is the secretaryship of the Asiatic Society, which he occupied for more than twenty-five years, and which was the real turning-point of his career. The duties attaching to his office, especially the editorship of the society's journal, and the constant opportunities afforded him for associating and corresponding with the best Oriental scholars and antiquarians of the day, English and foreign, coupled with a natural taste for philological research, went far to efface the traces of a want of early philological training, and to impart to his mind that breadth of information which soon became so well appreciated by the many students who consulted him. But the time soon came when the critical sagacity and patient industry of Mr. Norris were put to a more serious test. In 1845, impressions, very faint and indistinct, on pieces of cotton cloth, taken by Mr. Masson from the rock inscription of king Aṣoka, near Kapur di Giri, were placed at the disposal of the society, and Mr. Norris at once undertook the difficult task of deciphering this curious document, and producing a correct representation of it on a reduced scale for publication in the society's journal. The masterly and thoroughly satisfactory manner in which he accomplished this task fully deserved the terms of admiration freely bestowed upon it by scholars like Professor Wilson, then director of the Asiatic Society. The following year, however, was destined to turn Mr. Norris' energies into a new channel of research, too attractive to be ever again abandoned. The immediate occasion was Major, now Sir Henry, Rawlinson's copy and analysis of the great cuneiform record of Darius Hystaspes at Behistun in Persia. It fell to Mr. Norris' lot to carry this important memoir through the press; and so thoroughly did he penetrate, by unwearied exertion, the mysteries of the newly disclosed dialect that not only did he render essential service to the early publications of Sir Henry Rawlinson (whose official employment at Baghdad prevented their being revised by himself, thus saving them from being ushered into the world in a comparatively imperfect state), but Oriental scholars soon learned to look upon him as one of the chief authorities in cuneiform philology. Besides several papers on these subjects contributed by Mr. Norris to the *Journal of the Asiatic Society*, the most important of which is his "Memoir on the Scythic Version of the Behistun Inscription" (vol. xv. 1855), he assisted Sir Henry Rawlinson in publishing for the British Museum two volumes of cuneiform inscriptions, thereby furnishing ample materials for more extended cuneiform researches (1861-66). The chief result, however, of these studies, and the work which, though incomplete and however modestly put forth, marks an epoch in cuneiform studies, is Mr. Norris' *Assyrian Dictionary*. Three volumes of this work were published in 1868, 1870, and 1872 respectively, comprising the letters Aleph to Nun. Much of the contents of these volumes may no doubt become antiquated, and many of the tentative meanings assigned to words may be rejected hereafter; still they will always be acknowledged to contain a great amount of useful and trustworthy information, showing on every page the vast extent of Mr. Norris' reading; while those who use his work cannot but admire the singular candour and modesty with which he places before his fellow students the results of his enquiries. The works hitherto mentioned, whilst they are the principal, are by no means the sole, fruits of Mr. Norris' philological labours. For some time he paid considerable attention to the Celtic dialects, and in 1859 published in two volumes the text and translation of three Cornish dramas, constituting by far the greater portion of the existing relics of Cornish literature. Of other publications may be mentioned, *A Specimen of the Vai Language of West Africa* (1851); *A Grammar of the Bornu or Kanuri Language* (1853); and *Dialogues and a Small Portion of the New Testament in the English, Arabic, Hausa, and Bornu Languages* (1853). A disposition naturally modest and retiring impeded the recognition of Mr. Norris' merits in the great world (his only honours were a foreign membership of the German Oriental Society, and a Bonn honorary degree of Doctor of Philosophy); but none who had the happiness of his acquaintance, or who have carefully studied any of his works, will withhold their tribute to such a rare union of excellences.

#### Intelligence.

The cuneiform inscription referred to in *Academy* of December 1 (vol. iii. p. 460), as containing, in Mr. G. Smith's opinion, the Babylonian version of the story of the Deluge, turns out to be an Assyrian translation of an Accadian or proto-Chaldaean text deposited at Warka (Erech). There can therefore be no doubt of the extreme antiquity of the narrative. The Assyrian text is evidently encumbered with numerous glosses, and the reading of the proper names is doubtful. Sir H. Rawlinson (*Athenaeum*, December 8) conjectures that the twelve tablets, of which that describing the Deluge was one, embodied a series of myths connected with the signs of the zodiac. The eleventh Babylonian month was dedicated to the god of rain and tempests, and answers in the zodiac to Aquarius. Hence the myth on the eleventh tablet embodies the story of the Deluge. It is much to be desired that Mr. G. Smith's discovery may be verified as soon as possible by other Assyriologists.

M. Lenormant read a paper lately before the Académie des Inscriptions on the sources of our knowledge of the Accadian language, of which he proposes to write the grammar.

A German translation of Luzzatto's grammar of the Biblical Chaldee and the idiom of the Babylonian Talmud has been brought out by Dr. Krüger. The few notes added by the translator are of no great importance, and might have been improved by reference to modern Syriac. Thus מְרַחֵם לְפָנָיו (p. 71) may be illustrated from Nöldeke, *Gr. der Neusyrischen Sprache*, p. 77. That the pronoun מְרַחֵם is probably compounded of מְרַחֵם, which Dr. Krüger styles an incidental remark ("eine beiläufig gemachte Bemerkung") of Luzzatto's, is considered by Nöldeke (*op. cit.* p. 83) to be the only possible derivation.

Dr. Chwolson's recent tract, *Die Semitischen Völker*, has called forth some interesting critical remarks from Dr. Nöldeke in *Im Neuen Reich* for December. Dr. Chwolson, who so worthily sustains the character of Jewish scholarship in distant Russia, seems to have been carried too far in an opposite direction to Renan. Nations are not inert, immovable masses, but organisms susceptible of development and assimilation. Hence the characteristics of European Jews must not be set down to the credit of the race. The typical Semitic religion is not that of the Old Testament, especially when the latter is idealised, as it is by Chwolson, but Islam. The Indo-European races are not less productive in the field of religion than the Semitic, but inferior in moral energy. Chwolson denies the Semites an ascetic tendency, but he forgets the Nazirite vow, Essenianism, and the frantic asceticism of the Syriac Semites from the fourth to the seventh century. In politics, the Semites are—certainly not democrats, as Chwolson represents—but keen aristocrats; in warfare, incapable of sustained combination, except under extraordinary impulses; in science and art, too exclusively attentive to details.

Prof. Wright, of Cambridge, has edited the text of the three recently discovered leaves of the Curetonian Gospels from Prof. Roediger's edition, and from a copy of the manuscript made by himself. One hundred copies have been printed for private circulation.

The first fasciculus (Genesis) of Dr. Petermann's Samaritan Pentateuch has appeared. The only information as to the critical apparatus is contained on the title-page, from which we learn that the text and variant readings are drawn from MSS. collated by the editor at Nablous. The many interesting questions that suggest themselves—as to the date and comparative value of the MSS., and indeed as to those of the Samaritan text itself—will no doubt be answered in the preface. Dr. Petermann also notices where the editions read otherwise than his MSS. It is to be regretted that he did not act in concert with Dr. Heidenheim, who, as he informs us, has collated the printed Targum with the Roman MSS.

### Contents of the Journals.

**Journal of Philology**, No. 8.—Professor Grote (the late): On Glossology. [Continued from previous number.]—B. H. Kennedy: *Vindiciæ Sophocleæ*. [A series of somewhat petulant criticisms on Campbell's *Sophocles*.]—F. D. Morice: Two passages in Aeschylus and a note of Lobbeck. [On ποσειδών and στυγνός in *Ag.* 294 and *Prom.* 592.]—I. Bywater: Critical Notes on Clement of Alexandria.—The Same: On a passage in Aristotle's *Ethics*.—A. A. Vansittart: Fragments of an old Latin Apocalypse. [Gives the legible portion of the version of the Apocalypse in the Paris MS. noticed in No. 4 of the *Journal*.]—C. J. Monro: Latin Metres in English, after Sidney, Tennyson, and Mr. Ellis. [Chiefly strictures on Ellis' translation of Catullus.]—H. A. J. Munro: Catullus' Fourth Poem. [An elaborate commentary on the scene of the poem: a note appended proposes to transpose lines 7 and 8 in the Second Poem and read, "credo ut, cum gravis acquiescet ardor, sit solacium sui doloris."—The Same: Lucretiana. [Points out cases of hiatus in the traditional text of Lucretius, and gives a new explanation of iv. 42–53; concludes with remarks on transposition as a means of emending the text of Lucretius.]—R. Ellis: On the Fragments of Sophocles and Euripides. [Emends a number of these, and adds some fragments not hitherto included in collections.]—H. Nettleship: On the etymology of *consul*, *exsul*, *insula*, and *praesul*. [Connects the three first with the root found in the Gothic *sal-jan* and the German *Saal*.]—W. Selwyn: Emendations of certain passages of *Eusebii Eclogæ Propheticae*.—F. A. Paley: Verse Epitaphs on Roman monuments. [Observations critical and explanatory on seven epitaphs in Brambach's *Corp. Inscript. Rhenan.*]—H. Sidgwick: The Sophists. [An extremely able vindication of Grote's view, in answer to recent objections.]—H. Richards: Note on Herod. v. 28. [Acutely suggests ἀνταρτίους for ἀνείους.]—H. Jackson: On some passages of the *Nicomachean Ethics*. [Chiefly on v. 5: a new and most satisfactory interpretation of this difficult place.]—E. B. Cowell and J. E. B. Mayor: Fragments of Greek Comedy. [The former points out two fragments in Origen, *C. Cels.*; the latter one in the *Paroemiographi*, *Apostol.* vii. 20, where μετακέντηεν is to be restored.]

**Rheinisches Museum**, vol. xxvii. part 4.—L. Breitenbach: Xenophon's *Hellenica*, book i., compared with Diodorus and Plutarch. [Maintains the integrity and historical importance of the book in its existing form.]—J. Gildemeister and E. Bücheler: The pseudo-Plutarch *περί ἀρκήσεως*. [A German translation, with commentary, of the Syriac text in Lagarde's *Analecta*.]—H. Nissen: The History of Livy. [Suggests an entirely new mode of dividing the work, in place of the common one into decades.]—A. Rapp: The Maenads in the Greek cultus, in Art and Poetry.—C. Wachsmuth: Locrian Inscriptions.—W. Schmitz: On the Tironian Notes.—L. Jeep: On the MSS. of Claudian's *Raptus Proserpinae*.—A. Riese: On the *Historia Apollonii regis Tyri*. [A reply to Teuffel's theory as to the relative value of the MSS.]—B. Schmidt: The *Drymiæ*.—J. Steup: On Thucyd. iii. 17. [A defence of his view that the chapter is an interpolation.]

**The China Review**, ed. by N. B. Dennys. Vol. i. No. 1, Hongkong, July and August, 1872.—Introduction.—The She-king. [Review (excellent and highly favourable) of Dr. J. Legge's edition and translation of that work in his *Chinese Classics*, vol. iv. pt. i., by E. J. Eitel.]—The Adventures of a Chinese Giant. [Account of the adventures of Lo Tat, translated from a Chinese work of fiction entitled *Shwui Hu Chuen*, by H. S.]—A Chinese Farce. [Translation, by A. Lister, of the groundwork of a farce performed at the Tung Hing Theatre, on Nov. 12, 1869, before the Duke of Edinburgh.]—Su Tung-Po. [Account of that statesman and man of letters, who was banished to Canton about A.D. 1066; being a chapter from an unpublished history of the Kwangtung Province, by E. C. Bowra.]—Mr. Wade on China. [Translation, by H. E. Wodehouse, of an official memorial on the position of affairs in China, addressed to the Chinese Ministers of State, by Mr. Wade, at the request of Sir Rutherford Alcock.]—From Gotham to Cathay. [Account of a journey from New York (Gotham) across the "Great West" to China.]—Rhymes from the Chinese. [Poem "To a Successful Friend," translated from To Pô, by J. Chalmers.]—The name "Hongkong." [The name is explained as meaning "pleasant port," instead of "fragrant streams."]—China's Place in Philology. [Review, rather unfavourable and severe, of J. Edkins' work, by T. Watters.] Short notices of new publications and literary intelligence.—Notes and queries.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. IV.—No. 63.

Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for. The Editor cannot reply to questions from authors respecting the notice of their books. The next number will be published on Wednesday, January 15, and Advertisements should be sent in by January 11.

Now Ready, in crown 8vo., price 5s. cloth,

## The Problem of the World

AND THE CHURCH RECONSIDERED, in Three Letters to a Friend. By A SEPTUAGENARIAN. Second Edition, Revised and Edited by JAMES BOOTH, C.B.

"The book is full of intelligence, everywhere reflecting an earnest, active mind, and keeps the reader interested by constant *apropos* quotations from all sorts of contemporary literature and references to passing events. It is a book that may be read with interest and profit by all who trouble themselves about the Church or the world."—*Theological Review*.

"The 'Problem,' &c., is a temperate and well-reasoned exposition of the insufficiency of orthodox religion to satisfy any of the requirements of man. There cannot be too many such books as this issued; and if all were as skillful as this, we might hope for the speedy overthrow of the religious bigotry and folly that still hamper the progress of Society."—*Examiner*.

"As a pleasing and interesting specimen of a prominent phase of cultivated opinion at the present day, we can heartily recommend this volume."—*Spectator*.

London: LONGMANS, GREEN, & Co., Paternoster Row.

Just Published, in 16mo., price 1s.

## Doctors Dissected; or, Uni-

versity Degrees fairly Represented. By a British and Foreign Graduate.

London: LONGMANS, GREEN, & Co., Paternoster Row.

### Professor CONINGTON'S Works.

In Two Vols., 8vo., price 28s. cloth,

## Miscellaneous Writings of

JOHN CONINGTON, M.A., late Corpus Professor of Latin in the University of Oxford. Edited by J. A. SYMONDS, M.A., late Fellow of Magdalen College, Oxford. With a Memoir by H. J. S. SMITH, M.A., LL.D., F.R.S., Fellow of Balliol College; Savilian Professor of Geometry, Oxford.

London: LONGMANS, GREEN, & Co., Paternoster Row.

## Text-Books in Logic, Mental

and MORAL SCIENCE, by ALEXANDER BAIN, LL.D., Professor of Logic in the University of Aberdeen:—

LOGIC, DEDUCTIVE and INDUCTIVE, price 10s. 6d.

Part I. DEDUCTION, price 4s.

Part II. INDUCTION, price 6s. 6d.

MENTAL and MORAL SCIENCE, price 10s. 6d.; or, Part I. PSYCHOLOGY and HISTORY of PHILOSOPHY, price 6s. 6d.

Part II. ETHICAL PHILOSOPHY and ETHICAL SYSTEMS, price 4s. 6d.

THE SENSES and the INTELLECT. Third Edition, 8vo., price 15s.

London: LONGMANS, GREEN, & Co., Paternoster Row.

In Two Vols., 8vo. (1865), price 28s. cloth,

## The Hidden Wisdom of

CHRIST and the KEY of KNOWLEDGE, or History of the Apocrypha. By ERNEST DE BUNSEN.

"The problem of the formation of Christian doctrines may be regarded as solved."—*Revue des Deux Mondes*.

By the same Author, in One Vol., 8vo. (1867), price 14s.

## The Keys of Saint Peter,

or the House of Rechab connected with the History of Symbolism and Idolatry.

London: LONGMANS, GREEN, & Co., Paternoster Row.

Nearly Ready.

## THE ODYSSEY OF HOMER.

Vol. II., Books 7 to 12.

Edited with Marginal References, Various Readings, Notes, and Appendices,

By HENRY HAYMAN, D.D.,

Late Fellow of St. John's College, Oxford, Head Master of Rugby School.

8vo., cloth.

London: DAVID NUTT, 270, Strand.

Just Published, crown 8vo., cloth, 3s. 6d.

## The Wanderings of Aletes,

and other POEMS. By MATTHEW OF GOWER.

"Sunt bona, sunt quadam mediocria, sunt mala plura, Quæ legis hic, aliter non fit, Avite, liber."—MARTIAL.

WILLIAMS & NORGATE, 14, Henrietta St., Covent Garden, London; and 20, South Frederick Street, Edinburgh.

## Trübner & Co.'s New Publications.

**Zoological Mythology; or, the Legends of Animals.** By ANGELO DE GUBERNATIS, Prof. of Sanskrit and Comparative Literature in the Istituto di Studi Superiori e di Perfezionamento, at Florence, &c. Two vols. 8vo., pp. xxvi+432, and vii+442, cloth, 28s.

## General Literature.

*Les Humbles.* By François Coppée. Paris: Alphonse Lemerre, 1872.

Two years ago, in the pages of the *Academy*, it was sought to estimate the work of the most acceptable of recent French poets, from the time when the work was tentative and the poet a youth to the time when the work was surer and the poet an accomplished man. M. Coppée's course since 1870 has been unequal, and at certain moments disappointing; but its last step is a step in advance—the publication of *Les Humbles*. The war and the revolution were misfortunes for his work, his genius and acquirements not being of the kind to be exalted by either. Victor Hugo, with no loss of prestige or power, could bewail "the terrible year" in passionate verse; but Coppée, who is most of all literary and least of all political, struck only a feeble and unworthy note in his few lyrics of the war and the peace. In common with many another imaginative writer, for whom the times have proved too heavy, he produced duly measured lines which as to the matter, not the manner of them, are fuller of patriotism than of poetry. So at least one must speak of the "Lettre d'un Mobile breton," and of the "Plus de Sang"; yes, even of the "Bijoux de la Délivrance," and of "Fais ce que dois," though these have at all events, in addition to the habitual faultlessness of versification, the accent of passion and a very seething sense of unforgotten wrongs.

Of "L'Abandonnée"—a two-act drama in verse—something more, or something different, deserves to be said. It did not show to those who watch the progress of this poet—a leader, we may call him, of the third or new generation of romanticists—that he had acquired the constructive skill usually so necessary at the theatre, for it presented scarcely more than two situations—the beginning and the end of a career—with between them a lapse of time and events which no common treatment by a common dramatist could justify. And yet, however ineffective may have been this play upon the stage, one is not inclined to quarrel seriously with M. Coppée on account of it, because the very abruptness of transition from beginning to end renders more vivid the contrast of the *tableaux*: first, the little sewing-girl is exposed to a temptation; then, suddenly, it is an outcast who dies at the hospital—the student and

seducer of past years now standing as physician by that premature death-bed.

From the new volume, styled *Les Humbles*, memories of the war are not wholly absent; and in so far as they are present, they weaken the book. For the little war-poems have neither the substance nor the style which one demands in work that is to last; and their admission into a volume otherwise so worthy to live is probably due to the fact that artistic and sympathetic men who live through a great national crisis feel the interest of that crisis so stupendous that they become for the time incapable of knowing the artistic value of work which has that crisis for subject. For the moment, almost any treatment seems sufficient—the treatment being so little, the subject so much—and it is only when the passion of the time has cooled that there become apparent the deficiencies which passion and sympathy have covered. And from this may be deduced a one-sided truth, to add to the many which are the fruit of criticism—the truth that an artist may do well to eschew in his work those contemporary themes which stir him to a point at which excitement becomes *exaltation*. His work is better when thrown back upon art alone for its effect. This, at all events, is a half-truth which we may preach to M. Coppée.

And the finest and most abiding things in *Les Humbles* are undoubtedly the poems in which M. Coppée has treated themes without his personal experience; relying, if you will, upon keen observation, but also upon dramatic power, for the insight into lives different from his own, and upon unspared labour for the art which makes the student's observation and the poet's insight useful or pleasurable to men. "La Nourrice" is probably the strongest and the saddest of these studies of humble and secluded life which M. Coppée has executed, and one must go back to that which is quite the best in Victor Hugo—quite the most vivid in Casimir Delavigne—to find the equal of his picture of the wet-nurse in the mad-house at Caen: a woman with aimless hand on a livid breast, and foot mechanically rocking an empty cradle, for all consolation. Art like this has something in common with the pictorial art of Regnault. To borrow a happy word of Mr. Colvin's, it is an art, not of rapture, but of "remonstrance."

A study calmer and not less complete is that of "Le Petit Épicier." What there is of poetical—nay, what there is of tender, humane, and regretful—in the character and intimate

thought of a small tradesman of Paris, is here brought out with very noteworthy skill, and still more noteworthy sensitiveness and breadth of appreciation. And the whole family group—the peevish and disappointing wife, the embittered, silent husband, and the mother who goes back to Soissons lest bad times should become worse—all these are presented with a delicate fidelity and individuality which Meissonier would hardly surpass, and with a peculiar quietness and reserve of pathos which more often accompanies somewhat different gifts. The picture of the unfrequented shop in the third-rate quarter of Paris, with the brooding “little grocer” chopping his sugar with melancholy, may well remain with one when the memory of more ambitious work shall have passed away. In the poems entitled “En Province” and “Un Fils” the work is equal in carefulness and completeness to that in “La Nourrice” and “Le Petit Épicier”; though in one of these—“En Province”—the work is bestowed upon a subject which lacks the striking dramatic situation of the “Nourrice” and the peculiar and unwonted appeal of the “Little Grocer.” In “Un Fils” there are many touches indicative of shrewd yet indulgent contemplation of the world and its ways. It is not, for example, quite without originality that M. Coppée represents the poor and sometime blameless mother as eventually soured and spoiled—not blessed and edified—by a life of monotonous trial. And again, in the *conciérge* of the house where mother and son occupy a couple of attics, we have a sketch of complacent prosperity which, if sufficiently enlarged and elaborated, might be of some service in comedy.

Turning to the “Promenades et Intérieurs,” which close the volume, it becomes clear that it is no longer much of matter, but chiefly of manner, that we can speak. Little poems of ten lines each, they record an impression while it is fresh; a feeling hardly strong enough to be called an emotion; the aspect of a chamber at a given moment; the glimpse of the poet playing the flute at an open window in summer. They may be thought of along with some among the smaller etchings of Ostade, alike for triviality—or, dare I say, simplicity?—of subject and delicacy of treatment. This at least is true of the best of them: perhaps not of the many which seem indeed to need the apology of that playful fiction by which, in the last of the set, the reader is represented as looking over the shoulder of the writer, to read that which is meant for the writer alone. But it is true—and perhaps even stronger praise might be true—of some half-dozen; including certainly the lines in which M. Coppée has hinted at that errant *Sehnsucht* of the poetical un-Philistine nature which I think Mr. Matthew Arnold has painted in his “Scholar-Gipsy,” and Mr. Browning (of course, how differently!) in his study of “Waring.”

FREDERICK WEDMORE.

Taine's History of English Literature. II. van Laun.  
Edmonston and Douglas.

M. TAINÉ has read most of our classics, and he has also been graciously pleased to decide that the artistic evolution of a nation is a reflection of its social evolution. This theory has two merits; any one who was engaged in serious researches in the history of a literature might find it an useful working hypothesis, and any one who wished to group the obvious facts about a foreign literature in an emphatic and plausible way would be the better for such a thread to stretch his collections on, and would not be reduced to the necessity of trusting to the daily decreasing remoteness of his subject for the freshness of his book. Even without such assistance, M. Taine's vivacity would have secured freshness enough, and when we have compared the size of

the book with the extent of the subject, a few diffuse and copious pages are enough to show that the author has taken too much space for exposition to have room left for original enquiry. In fact, the theoretical part of the book comes to little more than a statement that the English have what the translator calls “a deeper sap” than the French, which is illustrated *ad libitum* by bringing the familiar contrasts between French and English history to bear on the familiar contrasts between French and English literature. This is done with an union of force and clearness and profusion which almost recalls Macaulay; only Macaulay was fortunate in always having a definite story to tell, or at least a definite thesis to prove. To have gone through English literature with unfailing vigour with no very glaring omissions and with what may be called substantial accuracy is a very considerable feat: but here our praise must end. M. Taine appears to be of opinion that his method is an advance upon Sainte-Beuve's; it is a pity that he did not allow himself to be guided as often as Sainte-Beuve by the presumption that whatever has been respected is probably respectable. Literary scepticism may easily be excessive; to be quite frank, there are passages (especially in the chapter on Pope) which recall the irreverence and injustice of the Romanticists without their fervour; there are others which recall the narrowness of the older school of French criticism without its systematic sanity. In details the conventional account is too often repeated without examination: it is a more serious fault that the whole treatment of what we call the Elizabethan period is capricious to the last degree; all the minor dramatists, from Kyd and Marlowe to Webster and Massinger, are discussed pell-mell; then we have a chapter on Jonson; then a chapter on Shakespeare. Considering how the authors of that period studied and criticised each other, it is simply astonishing that a writer with pretensions to a scientific method should have sacrificed the natural development of his subject which coincided with the simple chronological order to a frigid rhetorical climax. After this it is not surprising to find the anthropomorphism of Milton caricatured (often with a certain felicity) on the hypothesis that his imagination was occupied with the vision of a heavenly Whitehall, while such a magnificent *tour de force* as the *Samson Agonistes* his most faultless, though far from his greatest, work, is ignored altogether. Dryden is better treated; he was not above the level of the highest admiration of an industrious *littérateur*. It may be matter of opinion whether the Romantic movement has produced better fruit in France or England; whether it is a compliment to Wordsworth that M. Taine finds parts of the *Excursion* almost like a discourse of Théodore Jouffroy's; and whether Alfred de Musset is really a more profound or original poet than Tennyson. It is certain that M. Taine seriously misconceives the aesthetic value of the archaic element in Scott's novels, that he utterly misses the ethical charm of his poetry, and, for that matter, of poor Southey's too. He imagines that the value of both is simply that they have a good collection of picturesque properties, whereas Southey's merit lies in his moral elevation and in the dignified and ingenious though slightly mechanical construction of his stories, while Scott's lies in the temperate sentimentalism of a robust and healthy nature.

The fifth and last book is simply a collection of separate studies on Macaulay, Dickens, Thackeray, Mill, Carlyle, and Tennyson. The essay on Mill has been approved by its subject; those on Thackeray and Dickens are ingenious and amusing, though the writer makes the mistake of attributing all the traces that they share the moral beliefs of Englishmen to a direct purpose of moral edification, to which Thackeray at least was a stranger.

*A propos* of Thackeray, it is a pity that Mr. van Laun has not noticed that in the popular edition of *Vanity Fair* a passage which he assures us was omitted after the first edition has been happily replaced. The author is satisfied with the fidelity of the translation, and in spite of one or two curious locutions it is readable enough; and it is certainly a public service to have placed a work so vigorous and stimulating as Taine's *History of English Literature* in the reach of that large and unhappily increasing class who read not from desire of knowledge, but to avoid the inconveniences of ignorance.

G. A. SIMCOX.

**An Introduction to the Study of Dante.** By John Addington Symonds, M.A., late Fellow of Magdalen College, Oxford. Smith, Elder, and Co., 1872.

MR. SYMONDS' agreeable volume differs from other books that have lately been published on the same subject in being rather a critical review of Dante's great poem than an explanatory analysis of its contents, like Miss Rossetti's *Shadow of Dante* (see *Academy*, vol. ii. pp. 551, 552), or this together with the discussion of numerous theories relating to it, like Dr. Pfeiderer's *Göttliche Komödie* (see *Academy*, vol. iii. pp. 163, 164). It is true that incidentally we are introduced to a great part of the poem, and are thus enabled to form a tolerably accurate idea of its various parts, but the course of Dante's narrative is not systematically followed. Nor does Mr. Symonds, though he has evidently studied the text of the *Commedia* with minute care, pretend to an extensive knowledge of the questions which have been raised in connection with it, for in his preface he expressly disclaims any but a limited acquaintance with Dante literature, nor do we meet with any reference throughout the book to the great German critics, who have contributed more than anyone else to the right understanding of the poem. Anyone, therefore, who expects to find these elements in this volume will be disappointed, and for this reason a better title might perhaps have been found for the work than *An Introduction to the Study of Dante*; but still *non omnia possumus omnes*, and our author's style is so delightful, his criticisms for the most part so excellent, the points he discusses so numerous and so varied, and the interest with which he invests the subject so sustained, that we should be hard to please if we required more. It is, therefore, as a critical and artistic study of the poem that we propose to regard it, premising first a general account of its contents.

Mr. Symonds commences with an interesting sketch of the general tendencies of Italian history before Dante's time, and of the causes which produced the political entanglements in the midst of which he lived. Here, as elsewhere throughout his book, he endeavours to elucidate his subject by means of comparisons; and so, contrasting mediæval Italy with ancient Greece, he describes the influences which prevented the Italian States from working out their history as those of Greece had done—the jealousy and greed of foreign powers, and the existence of an anomalous spiritual power in the midst of them. "It was," he says, "as if the States of Greece before the age of Pericles had been subject to the continual interference of a flourishing Persia, a greedy Macedonia, a heartless Carthage, and, moreover, had established in the midst of them, say at Delphi, a selfish theocracy, regardless of their interest, but rendered potent by superstition and by unbounded wealth." In the same way, at the end of the volume there is an excellent analysis of the spirit of chivalry, in connection with the influence of the Provençal poetry on Dante and his contemporaries in Italy. The second and third chapters are taken up with a life of the poet, together with notices of his minor works, after

which our author proceeds to what is evidently to him the interesting part of his work, the study of the *Divine Comedy*. Under the head of the "subject and scheme" of the poem, he discusses such questions as its relation to other epic poems, the originality of its conception, and the nature of its allegory; then passing on to its "human interest," he speaks of various features of Dante's character as revealed in the *Vision*, his mode of viewing human nature and the men of his time, and the human aspect of the principal episodes of the poem; and in order to discuss the different characters introduced more fully, he conducts us through the various spheres of the spiritual world, and passes in review the main personages that are found in each. Finally, he investigates "the qualities of Dante's genius," the intensity and definiteness of his power of vision, his compression of thought, and the trenchant brevity of his expressions; in illustration of which points he notices his pictorial descriptions and his similes; and compares the sublimity of Dante with that of other great poets, and his art with the other forms of art in mediæval Italy, concluding with an estimate of his place in the literature of modern Europe. All these points, and many subsidiary ones, are treated succinctly and lucidly, and illustrated by well-chosen passages, so that a definite impression is left on the mind, and the reader's interest is never allowed to flag.

In designating the *Divine Comedy* as an apocalypse rather than an allegory, and comparing it with the Revelation of St. John, inasmuch as in both of them the great truths that they embody are represented in the form of pictures and narrations, Mr. Symonds appears to us to have drawn a very accurate distinction. At the same time he does not deny that a distinctly allegorical element appears here and there in the course of the poem, and in particular at its commencement; though in interpreting that part he has laid too much stress on the political side of the allegory, to the exclusion of its moral and personal bearings. He is happy also in his comparison of Dante and Milton, where he characterizes the former as Italian and mediæval, the latter as Northern and a child of the Renaissance. His style is so charged with metaphors and metaphorical expressions, and his desire of placing every statement before the reader in the most forcible light is so strong, that we might almost fancy he had been infected by the spirit of his favourite author. We cannot do better than give a few instances of his effective use of this kind of diction. "Dante incarnates the spirit of Mediæval Christianity, so that we may study it in his poem as we interrogate the features of a face to learn the secrets of the soul beneath." The meeting of Virgil and Beatrice is "the mild and melancholy radiance of the faithful guide of the *Inferno* paling before the rising splendour of the queen of Paradise, as the moon fades into the dawn and vanishes in silence." The harmonious structure of the poem is called "the line of beauty, plastic in the poet's hand, which curves and is complete in the three *Cantiche*." The following description of three different kinds of epic rhythm deserves to be quoted at length:—

"In reading the hexameters of Homer we seem to be sailing buoyantly over the crests of Atlantic waves: Milton's blank verse is like a fugue voluminously full upon an organ of many stops: Dante's *rime*, terse, definite, restrained within precise limits, has no Homeric ocean-roll, no surges and subsidences of Miltonic cadence, but, instead, a forceful onward march as of serried troops in burnished coats of glittering steel. His lines support each other, gathering weight by discipline, and by the strict precision of their movement. Or, to use another metaphor, they are closely welded and interlinked like chain-armour, so that the texture of the whole is durable and supple, combining the utmost elasticity with adamant hardness."

In like manner, there is much vigour in such expressions as "the powerful will with which he forced thought into

language"; "he wrings sublimity from his subject in spite of its detail and minuteness"; and the love of the *Vita nuova* is happily described as "such love as the 'young-eyed cherubim' might feel." A style which abounds in these forms of speech requires to be carefully guarded, and it is surprising that our author should have succeeded in sustaining it so well throughout his volume; but if he takes a wider flight in literature, he will be wise to prune it considerably. In a few instances the desire to be effective has even betrayed him into faults of taste. It was hardly well to tell his readers that "the Bolge are full of action, vanity, and interest. We do not wonder what the demons find to do to drive away their sulphurous ennui."

And yet, notwithstanding Mr. Symonds' careful study of Dante, we cannot help doubting whether he fully appreciates him after all. His point of view is so much of the nineteenth century that he seems to admire rather than to sympathize. For this reason he is hard on the mediævalism of the poem, and finds many parts dull, which, in spite of their abstruseness, possess a peculiar interest of their own. He finds, without reason as we think, great frigidity arising from the twofold character in which Virgil and Beatrice appear, of human persons and allegorical abstractions. He complains that we are prevented from feeling interest in them. But they are not intended to excite our interest; half the weird mysteriousness of the poem would be lost if we felt that our guides were beings like ourselves, and were not half shrouded by their double personality. Nor can we allow that the *Commedia* is deficient in scenic sublimity, or that this is seriously interfered with by the smallness of scale of much that is described, or by the definiteness of the delineation; the darkness, and confused sounds, and half revealed forms, that compose the background of all the scenes in the *Inferno*, more than counterbalance any sense of limitation which might arise from these causes, and the whole atmosphere of the *Paradise* is that of indefinite magnitude. But though in some of these points we may think that Mr. Symonds has not fully entered into the spirit of his author, we can unhesitatingly recommend his book to students of Dante, for the interesting and tasteful criticism which it contains.

H. F. TOZER.

**Traditions, Superstitions, and Folklore** (chiefly Lancashire and the North of England): their Affinity to others in Widely Distributed Localities, their Eastern Origin and Mythical Significance. By Charles Hardwick. Manchester: A. Ireland and Co.; London: Simpkin, Marshall, and Co., 1872.

THE author of this book says, at the end of his preface: "I would gladly persuade myself that I have, at least, rendered what many regard as frivolous, and others as very abstruse and very 'dry reading,' interesting, attractive, and instructive to the general reader;" and to a certain extent he may have succeeded in his purpose. But he should have set to work more carefully in order to avoid leading the "general reader" astray by false or inaccurate statements such as a few that I will instance. On p. 36, we read: "Mr. Angus (read Angas) says, some of the western tribes of Australia 'have no means of kindling fire,' . . . the Tasmanians are in the same predicament. . . . According to Father Gabian (read Le Gobien), fire was utterly unknown to the natives of the Ladrone Islands." The erroneous character of these pieces of information appears from Tylor's *Early History of Man-kind*, p. 234, seq., 238., 2nd ed. On p. 61, Mr. Hardwick quotes "a work entitled 'Naogeorgus,' but generally styled the 'Popish Kingdom,' published in 1570, and translated by Barnabe Googe." Naogeorgus (Grecised from Kirchmayer) is the name of the author of the well known work,

*Regnum Papisticum*, not the title of the work itself. What is repeated from Kelly, on p. 68, about "Kushtha, the embodiment of the Soma," &c., is corrected by Max Müller, *Chips*, ii. 206, seq.—The story quoted on p. 129 from Crofton Croker, of the *boggart* who accompanied the farmer Cheetham on his flitting, is not a *novvellette*, but a genuine *tradition* existing amongst many peoples. *Vide* Grimm, *Mythol.* p. 480; *Gervasius von Tilbury*, ed. Liebrecht, p. 167; and my notice of Harland and Wilkinson's *Lancashire Folklore*, in the *Heidelberg Jahrbücher*, 1868, p. 93. "The dawn of Ragnavöck (read Ragnorök or Ragnarök), 'the great day of arousing,' according to Scandinavian mythology" (p. 135). Where did Mr. Hardwick find such an explanation?—"Frederic Barbarossa, he of the red beard like Odin" (p. 164)—for *Odin* read *Thor*.—"Kelly says he can find accounts of the nightmare assuming the forms of a mouse, a weasel, a toad, and even a cat, but never of a horse or a mare, except in the picture referred to" (p. 184). But see Grimm, *Myth.* p. 433, 1194; Ralston, *Songs of the Russian People*, p. 133, 2nd ed.; Ellis, in Brand, iii. 155, "The Nightmare and Her Nine Foals." The painter Fuseli is not, therefore, guilty of perpetrating a "great and absurd blunder."—"The Rev. G. W. Cox, in his *Mythology of the Aryan Nations*, referring to the origin of Greek 'Lykanthropy,' says:—'The question to be answered is, Whence came the notions that men were changed into wolves, bears, and birds, and not into lions?'" &c. (p. 240). But Dr. Livingstone reported, in his first travels, that the inhabitants of the neighbourhood of Kebrabasa, on the Zambesi (near the Portuguese settlements), believed their chieftain to have the power of transforming himself into a lion when he wished to kill anyone, and then resuming his human shape. On p. 253 there is a quotation from a MS. of the seventeenth century: "Take a knife or an awl which has been stroked with a magnet, and previously stuck through a great Frögroda (?), slit the bark," &c. Instead of *frögroda* it should be *frö (groda)*; both words mean *frog* in Swedish, and the commoner expression *groda* is a parenthetical explanation of the rare form *frö*, which also means *seed*. It follows, therefore, that the charm in question was derived from Sweden. In addition to these corrections, I will only observe that in Mr. Hardwick's book there is much (e.g. chaps. i. ii.) that is confused, superfluous, and unprofitable to the "general reader," who will scarcely know how to find the passages referred to as in Kemble, Wolf, Schwartz, &c., without any more precise indication (for though they are nearly all to be found in Kelly, they have to be looked for there); and that Mr. Hardwick would have done well to leave etymology alone altogether, as he is a perfect tyro in the science. All these defects must be corrected before his book can prove "instructive" even to the "general reader."

FELIX LIEBRECHT.

#### LITERARY NOTES.

Mr. W. G. Palgrave's "Anatolian Spectre Stories," in the *Cornhill Magazine* for January, have a weird reality which would guarantee their authenticity even if the writer's name did not do so. In the last, popular superstition seems beginning to undergo the transformation which results in substituting ghosts for evil spirits.

*Fraser* is more readable than usual this month, though it cannot be said that Mr. Froude's "Address in Answer to Father Burke" does much to weaken the force of Mr. Lecky's strictures (*Macmillan* for January) on his new zeal for the divine right of the strongest and his political intolerance of Catholicism.—There is an ingenious paper on Shaftesbury by "L. S." treating him as the Matthew Arnold of Queen Anne's reign; a companion study of Mandeville is promised.—Mr. Galton's idea of "Hereditary Improvement" has the misfortune of being very old, for the natural

aristocracy which he proposes to found by the help of tables of averages, when founded, would be exposed to all the same temptations and dangers as aristocracies of birth or wealth in the past and present. Experience shows that in a close caste the average standard of physical and mental development may be raised for a time, but that the non-privileged classes suffer more than in proportion, and that such "sports" as really transcendent genius do not become more common than in a natural democracy.

"Sir Tray: an Arthurian Idyll," in *Blackwood*, is a good parody of some parts of Mr. Tennyson's last volume, which were no doubt open to the implied criticism.

*Lessing's Prosa*, a selection from his complete works, by A. Luthardt, for the use of schools and families, might supply a want more felt by foreigners than the author's countrymen. Good German prose is not plentiful to begin with, and the best authors in point of style are voluminous and not always didactic. But Lessing's best prose works are short, and both in style and substance deserve on their own account the deliberate study which reading-books receive, though it is half wasted on most of them.

The *British Quarterly Review* (January 1) has an article on Ewald with special reference to his last work, *Die Lehre der Bibel von Gott*, which the writer welcomes as a kind of palinode, modifying his most extreme statements on the subject of inspiration. The reviewer is not much at home in the learned world of Germany, as he makes Professor Max Müller the son of Otfried, the historian, instead of Wilhelm, the poet.

The "Study on Sophokles" in the *Westminster Review* for January is less valuable than most of its predecessors; the writer is too anxious to insist on the philosophical value of Sophokles as a precursor of Plato, finds the immortality of the soul as a religious doctrine in the *Antigone*, and considers the *Oedipus Coloneus* an adequate solution of the problem of human destiny as presented in the *Oedipus Tyrannos*. He is also at superfluous pains to deny the anecdotes which represent the poet as addicted to indulgences which in his age were not incompatible with self-respect. Altogether he is so busy with the claims of Sophokles as a preacher of righteousness that he fails to throw much new light on his characteristics as an artist.

One of the most amusing of Voltaire's blunders as an historian and a maker of compliments was that of apologizing to the Austrian chancellor Ulfeldt for not having, in the *Siecle de Louis XIV*, praised him for the gallant defence of Barcelona by his father some fifty years before. The letter in which Voltaire makes the mistake is not known, but it accompanied the copy of his work which was sent to Ulfeldt, with two others, for presentation to Maria Theresa and the Emperor Francis, and his answer to the chancellor's acknowledgment and correction has just been discovered by Alfred v. Arneth in the imperial archives at Vienna, and published for the first time in the *Vienna Abendpost*.

The Vicomte de Rougé, the well-known Egyptologist, died at Paris early in the month. The *ci-devant* Emperor Napoleon III., who died on the 9th inst., was not entirely without merit as an author. His *Napoleonic Ideas* gave rather inarticulate utterance to a certain measure of confused but original political insight. His *Vie de César*, though without independent scientific value, will rank rather above Frederick the Great's *Anti-Machiavelli* as a literary curiosity; some passages are very creditable specimens of how history may be written when more lion's whelps have learnt to paint.

In the *Allgemeine Zeitung* (January 11) Berthold Auerbach begins an elaborate and rather enthusiastic appreciation of Gustav Freytag's last romance, *Ingo und Ingraban*, parts of which he considers to be nothing less than Homeric.

Mr. W. R. S. Ralston, of the British Museum, author of *The Songs of the Russian People*, and translator of Krilof's *Fables*, has been elected a corresponding member of the ethnographical section of the Imperial Geographical Society of Russia.

## Art and Archaeology.

Rossi's and Cibo's Painters of Foligno. [*I Pittori di Foligno. Testimonianze autentiche, raccolte ed ordinate dal Prof. Adamo Rossi. Perugia, 1872. Niccolò Alunno e la Scuola Umbra. Di S. Frenanelli Cibo. Roma, 1872.*]

THERE was a time within the memory of the present generation when Italian writers on art produced essays in which real ignorance was thinly concealed under rhetorical flourishes. A great and curious change has taken place in our day; and modern students of the fine arts in Italy are content to register with cold accuracy the fruits of research in the records of municipalities or lawyers' offices. It is quite natural that Italian writers should fall from one extreme into the other; but a pardonable wish may be expressed that they should season their materials with something less dry than the texts of contracts or the bare sentences of inscriptions. Both of the books to which our attention is now directed are made up in a great part of documents; one is published at Rome, the other at Perugia. Both are the result of independent enquiry; yet they treat of the same matters, and are published at the same time. Without attempting to divine what cause induced two writers apparently strangers to each other to enter minutely into the chronology and life of painters so obscure as those who illustrated Foligno in the fifteenth century, it may be useful, in a few sentences, to extract what these contributions contain that is new and useful to the history of art.

Looking back at the earlier periods of development in the cities bordering the valley of the Topino, and comparing the remnants of pictorial productions which they contain with those of more important centres, we observe that previous to 1450 the models most in favour were those of the school of Sienna. To the preservation of one picture in San Salvatore of Foligno we owe our knowledge of Bartolommeo di Tommaso, who cultivated this form of art with moderate success; but a record of 1447, printed by Rossi, discloses Bartolommeo's permanent residence at Foligno, and proves that Siennese tradition was not a transient one, nor entirely dependent on the wandering disciples of a distant school.

The quaint sternness of Siennese types was modified by the Umbrians to a languid softness, which in some artists of the better sort is often charmingly touching. Some traces of this feeling are apparent in Pier' Antonio Mesastris and Alunno, both men of local repute, who were natives and residents of Foligno; but Siennese and Umbrian tradition was modified in both by the spirit and works of Gozzoli. Till now we could only surmise that Alunno and Pier' Antonio contributed to the decoration of Santa Maria in Campis, which Pietro delle Casse founded in 1452 near Foligno. Cibo's quotation from Dorio's history of the Trinci family turns speculation into certainty by establishing that the Crucifixion at Santa Maria in Campis once bore Alunno's name in letters of gold. As this Crucifixion is taken almost exclusively from that of Benozzo at Montefalco, it is more than ever credible that Alunno was Benozzo's assistant. Before Alunno was thus employed, he had doubtless received lessons from a local master; and on this point we obtain some light from Rossi's publication of a will and other papers revealing a painter named Pietro di Giovanni Mazzaforte as the father-in-law of Alunno. We shall presently see that father and son-in-law once contributed to the production of an altarpiece in which the style of Mazzaforte is not to be distinguished from that of Alunno.

The name by which Alunno is known to the moderns is one with which his contemporaries were unacquainted. He

was christened Niccolò by his father, Liberatore di Mariano, of Foligno; but an inscription attached to an altarpiece in San Niccolò of Foligno poetically designates him as "*Alunus (scil. Alumnus) Fulginiae*"; and this designation was substituted, with the concurrence of centuries, for that by which Alunno was familiar in his own age.

The picture which bore the name of Niccolò coupled with that of Liberatore is also that which was executed, in 1465, by the joint labour of Alunno and his father-in-law. It remained till about 1782 in the church of San Francesco at Cagli, and escaped the research of Lanzi; but Lanzi had read a description of it in Colucci's *Antiquities of Picenum*, which reasonably pointed, as he thought, to the existence of an artist of the same name, but different family, who lived at the time of Alunno in Foligno. Rossi's discovery of Alunno's pedigree and alliances allows us to discern the real authors of the Cagli altarpiece, whilst it annihilates the theory of Lanzi. Gucci's description of the subject has revealed to Rossi that the panels now catalogued as Alunno's at the Brera are those which once formed the picture of Cagli, and are therefore the work of two hands.

The texts of Cibo and Rossi help us to relieve with some colour and shadow the bare outlines of the lives of Alunno and Pier' Antonio. Rossi, with fuller materials than his rival, gives the span of Alunno's career as 1430 to 1502, that of Pier' Antonio as 1430 to 1506. He shows how both artists were elected to the honours of the municipality of Foligno; and he traces through records Lattanzio and Bernardino, the sons respectively of Niccolò and Mesastris. He swells with a few names the list of craftsmen whose works were not preserved to our day.

J. A. CROWE.

#### JEAN COUSIN.

A PROPOS of M. Firmin-Didot's recent work on Jean Cousin, M. Gonse writes to the *Chronique des Arts* a letter in which he protests against the "sens général" of the book. Cousin is in the eyes of M. Gonse a second-rate artist, to whom a great deal of anonymous work has been unfairly attributed. In his zeal to detract from what he considers an exaggerated reputation, M. Gonse has even gone the length of ascribing to Cousin work to which neither the artist himself nor anyone else ever laid claim on his behalf. Cousin, says M. Gonse, engraved ("a gravé") the great mark of Jean le Royer which figures as the frontispiece of Cousin's *Livre de la Perspective*. Had M. Gonse but taken the trouble to glance for a moment at the book in question, he would have found that Jean le Royer engraved the mark himself. In his printer's preface he tells us that Cousin drew the designs on the wood, but that Aubin Olivier began to cut them, and he, Jean le Royer, finished them. So that M. Gonse, in his hurry to circumscribe the suspicious activity of Cousin, was actually carrying to his credit the exercise of one more art. But to return to M. Gonse's vigorous protest against what he terms the general sense of M. Firmin-Didot's book. M. Gonse acknowledges that M. Didot is a labourer in a virgin soil, and confesses that he himself is not specially competent to treat the subject. Now it is, to say the least of it, a curious coincidence that a study, carried on for some years past, of the French Renaissance by the present writer has resulted in substantially the same conclusions as respects the work and claims of Jean Cousin as those to which the venerable author of the *Étude sur Jean Cousin* has arrived. It is true that there is no documentary evidence forthcoming in support of these conclusions; but must we remind a Frenchman that there are facts which are none the less true because they cannot be proved? M. Gonse thinks Cousin a second-rate artist to whom much anonymous work is unjustly attributed: be it so; the only possible reply to such a statement is that those who have made a special study of his acknowledged and authenticated work find in it an accent of strong personal individuality which enables them to recognise his hand in other work as yet neither acknowledged nor authenticated. This unquestionably is the case in the adaptation of the cuts of the *Hypnerotomachia* for the French *Songe de Poliphile*, in

the cuts of the *Entrée de Henri II*, and in the cuts of the *Bible of Jean le Clerc*, all of which may be assigned, on internal evidence, to Jean Cousin. It may be remarked, in conclusion, that such attributions to Cousin as rest on the ground of internal evidence, M. Gonse repudiates, because they are not additionally confirmed by contemporary documents; but as soon as we come to the question of the statue of Admiral Chabot, where we have the written statement of a contemporary fellow-townsmen of Cousin's to back up his claim, M. Gonse immediately shifts his front, and, setting the manuscript aside, claims for himself, in this instance, the right of judging according to the superior and indefinable laws of taste, in preference to following the indications of a narrow archaeological and paleographical criticism. The position here assumed is of course impregnable, and reminds us of the grounds on which Dr. Hermann Grimm based his decision in favour of the Dresden Madonna as the original work of Holbein, *i. e.* its *geistige Wirkung*. However, any sign of interest in the Cousin controversy will be gladly welcomed by students of the French Renaissance; discussion and contradiction stimulate new efforts of research which may bring us nearer the truth, which is now at best very obscure. And when we have placed beyond dispute what is and is not the work of the obscure artist of Sens, we shall be better able to arrange with M. Gonse his appropriate place in the ranks.

E. F. S. PATTISON.

#### ART NOTES.

The death of Miss Susan Durant took place at Paris on the 1st of January. Miss Durant was well known to the public as a sculptor. She was a pupil of M. le Baron de Triqueti, and has left some creditable work as an evidence of the industry and success with which she pursued her chosen profession. When she failed, it was rather from want of solid and severe training than from any lack of natural ability and taste. A rare width of interests and an even rarer generosity and magnanimity of character had won for her the respect and affection of a wide circle of friends, who deeply lament her untimely and unexpected death.

Professor Anton Springer attacks, in the present number of the *Zeitschrift für bildende Kunst*, Hermann Grimm's *Life of Raphael* in no measured terms. He enters into considerable detail, and sums up with: "Wir sind mit Grimm's Buche fertig. Wir bedauern, dass der wenigstens halbünstige Eindruck der ersten raschen Lectüre bei eingehender Prüfung des Werkes sich vollständig verlor." He adds that he expected to find a certain number of errors and oddities, but he was not prepared for such boundless superficiality as to detail and so little zeal in research as shows itself when the author's mode of procedure is tracked step by step. Professor Springer considers that the root of all Dr. Grimm's mistakes is his incapability for sacrificing his own ideas, however empty or crazy, even when they conflict with evident facts.—In the same number, Bruno Meyer continues his article on the Academical Exhibition at Berlin.

The December number of the *Jahrbücher für Kunstwissenschaft* contains Dr. A. von Zahn's concluding article on the Holbein Exhibition, held at Dresden last year.—A list is given of the literature which was called forth by the famous controversy respecting the two Madonnas. Much amusement seems to have been caused by the correspondent of a well-known English weekly journal having introduced Bruno Meyer into his article as "a descendant of the family who kneel in the picture." Von Zahn calls Dr. Meyer's attention to this contribution to his pedigree.—Dr. Lücke contributes some remarks on pictures in Spain.—Eduard His commences an interesting notice of Urs Graf; and W. Schmidt notices a passage in a letter of Dürer's, and writes also a short article on Michael van Coxcyen.

The *Gazette des Beaux-Arts* for January contains a first article, by M. Henri Delaborde, on Florentine engraving in the sixteenth century; an essay on archaeological research as regards the middle ages, by M. Alfred Darcel; the continuation of Léopold Robert's inedited correspondence, by M. Charles Clément; a review of M. Jacquemart's *History of Ceramic*,

by M. René Ménard; a review of M. Wey's *Rome*, by M. Duplessis; a notice of the exhibition at Nantes, by M. Olivier Merson; a biographical notice of Sir Richard Wallace; a valuable account, by M. Louis Ménard, of the sculptures which have come to light in the recent excavations in the Forum. This notice is accompanied by two engravings from photographs taken from the bas-reliefs on the spot. The one represents a pig, a sheep, and a bull. The execution of this group is very remarkable. The bull is especially fine, and shows a grandeur and simplicity of form which seems to refer it to a good period, possibly that of the Antonines. The other, which is sculptured on the reverse side of the same block of marble, represents a procession of personages dressed in tunics, who appear to be public slaves; they carry in their hands large square tablets, which they lay one on the top of another in the centre. At one end of the composition is the ruminal fig-tree, and at the other a mutilated statue, which appears to be that of Marsyas. M. Ménard confines himself to simple comment and explanation of the groups; like M. Beulé, he suspends further discussion until the publication, by Signor Rosa, of those inferences concerning the topography of the Forum which the learned Italian archaeologist has been enabled to make from the situation of these remarkable monuments.

Dr. Henry Schliemann's excavations on what he believes to be the site of ancient Troy have brought to light a series of objects which suggest to his mind an entirely new interpretation of the word *glaukopis*, as applied by Homer to the goddess Athene. These objects, which have been found at various depths down to 53 feet beneath the surface, are (1) terracotta vases, ornamented with an owl's face and a helmet; (2) similar vases, ornamented with figures composed of the body of a woman with the head of an owl; (3) numbers of small figures with owl's faces, and being for the rest of female form. If he is right in taking these figures to be Archaic representations of Athene, the protecting deity of Troy, the literal interpretation of *glaukopis*, as the "owl-faced," will be obvious. The locality and depth of the find, and the presence of the helmet, satisfy him that he is right. That the figures of the goddess actually had an owl's head instead of that of a female in the early Homeric times, would be a startling announcement were we not aware of the fact that a very Archaic figure of Demeter at Phigaleia had, according to Pausanias, the head and mane of a horse.

### Theology.

**Researches on the Epistle to Diognetus.** [*Ueber den pseudojustinischen Brief an Diognet.* Programm für die Rectoratsfeier der Universität Basel von Franz Overbeck, Doctor und Professor der Theologie.] Basel, 1872.

AMONG other literary treasures which perished in the public library of Strassburg under the fire of the Prussian guns, was a manuscript of the Epistle to Diognetus, suspected, apparently with very good reason, of having been the only existing authority for the text of this interesting little work. The first edition—that of Henry Stephens in 1592—was printed from a copy made by himself of a manuscript of which he gives no particular account, and later editions have been founded on the text of Stephens, corrected only by another copy which Professor Beurer, of Freiburg, had made of the

same original. That the manuscript used by Stephens was no other than that of Strassburg seems probable not only from the fact that both possessed the same general features, there being in both the same *lacunae*, accompanied in each case by the same marginal note, and both having the same superscription by which the authorship is referred to Justin Martyr—but also from there being no other manuscript known to exist with which that of Stephens can be identified; so that, with the exception of Stephens' own copy, which is preserved in the Leyden library, Professor Beurer's having in the meantime disappeared, there remains to us nothing but the printed text, not now likely ever to receive much improvement.\*

The Epistle to Diognetus, no longer admitted to be a genuine work of Justin Martyr, is nevertheless assigned by the almost universal consent of critics to the age of Justin, or even a somewhat earlier period, and has been hitherto regarded as one of the most precious relics of the age immediately succeeding that of the apostles. The reasons for this opinion are, first, the superscription, which, after enumerating other writings of Justin contained in the same manuscript, adds, with reference to this work—5. Τοῦ αὐτοῦ πρὸς Διόγνητον; secondly, internal evidence, which is thought to point to a time when the Jews were engaged in actively persecuting, and making war upon, the Christians; and there is no time, it is argued, of which this could be said more truly than that of the Jewish insurrection under Barcochba, which terminated A.D. 135. A single reference, moreover, which is made, if the passage has not been misunderstood, to the second coming (*παρουσία*) of Christ as near at hand, has been urged as an indication that the epistle belongs at least to the first half of the second century. It is this view which Dr. Overbeck, in his very complete and exhaustive treatment of the subject, undertakes to disprove. He maintains, on the contrary, that the epistle is a literary forgery, belonging to the post-Constantine era, that the arguments referring it to the second century are of no value whatever, and that it contains the clearest possible internal evidence of its much later origin. I shall not, of course, be able to follow him through all the heads of his dissertation, but a few of them may be noticed.

And, first, let us see how he disposes of the arguments on the other side. Everyone must feel the force of the remark that unless the superscription establishes the authorship of the piece, it cannot retain any validity as to the question of chronology; just as it would be absurd to argue that, although the Rowley poems may not have been actually written by the monk Rowley, yet their inscription to him proves that they at least belong to the age in which he lived. And again, the reference to the second coming of Christ obviously proves nothing. That belief cannot even yet be alleged to be finally dead, and it certainly long survived A.D. 150, breaking out with especial vigour in all times of calamity and persecution. But whatever force this argument might otherwise have, it is rendered altogether nugatory if Dr. Overbeck

\* In regard to the "Glasgow Manuscript" of Justin's *Orations*, I am able to say that Dr. Overbeck is more than justified in rejecting Otto's conjecture that this is the copy of the Epistle to Diognetus made by Professor Beurer, of Freiburg, about the same time with that of Stephens. As this manuscript is duly announced by Otto (*Corp. Apoll. Christ. Saec. II.* vol. iii. p. xxv) as the "Codex Glascoviensis, membranaceus formae quadratae, et anno 1453 exaratus, qui teste Haenelio (*l. c.* p. 790) Justin's *Orationes* continet," it may be worth while stating, as the result of enquiries I have made, that the codex entered in the Glasgow catalogue as "Justin's *Orationes*" has nothing whatever to do with Justin Martyr, and the "Codex Glascoviensis" accordingly must henceforth be expunged from the list of authorities for Justin's text. As Dr. Dickson, the Curator of the University Library of Glasgow, who has been most obliging in answering my enquiries, promises a fuller explanation, I need say no more. Only it is perhaps proper to add, in justice to Professor Otto, that he concludes his notice of the Codex Glascoviensis by begging the learned to furnish him with more accurate information regarding it. Haenel or his informant would seem not to have looked beyond the catalogue.

be right in maintaining that the *παρουσία* mentioned in the epistle does not refer to the second coming of Christ at all, but to His sustaining presence in the hearts of His disciples. The words on which the question turns, following some reference to the patient endurance of the Christians, are these:—*ταῦτα τῆς παρουσίας αὐτοῦ δέγματα*, and this passage, Dr. Overbeck maintains, must be the reply to one of the questions which the epistle undertakes to answer; namely, What is the nature of the love which binds Christians together?—a question which would otherwise remain unnoticed. The difficulty arises from the fact that we have only the concluding words of a passage of which the greater part has been lost; but Dr. Overbeck's translation—"These (instances of fortitude and the fact that the more the Christians are persecuted the more they increase) are the signs of his perpetual presence with His disciples," gives a better meaning than if we took *παρουσία* here in the sense which it ordinarily has in early Christian writings. The word, however, has been used in its ordinary signification just prior to where the gap occurs in the text, and whether we are to say with our author that this has misled the critics as to its meaning subsequently, or whether we should rather follow the critics in thinking that its use once in the common signification fixes its meaning for the second instance, I shall not venture to decide. We now come to the third and what may seem the most weighty point of evidence, the reference to the warfare carried on by Jews against Christians. Here the words are—"They (the Christians) are attacked, or warred against (*πολεμοῦνται*), by the Jews as foreigners." Once more the answer of Dr. Overbeck seems conclusive. *Πολεμῶν* is not necessarily confined to war waged in a formal manner and by armed soldiers, but may be used of any form of hostility, and hostility more or less active on the part of the Jews against the Christians certainly continued long after the reign of Hadrian. The contrary opinion, says Dr. Overbeck, would have strange consequences for Christian literature, and he gives an example from a work ascribed to Hippolytus, in which Susanna, representing the Church, is said to be persecuted by the two elders, personifying the Jews and the heathen. The same argument, he contends, which would refer the epistle to Diognetus to the time of the Jewish insurrection in the reign of Hadrian would justify as early a date for this work, which is nevertheless confessedly a century later. Moreover, the words which follow—"those who hate them are unable to give any reason for their hatred"—distinctly point, he thinks, to a considerably later period than that to which this writing has been hitherto assigned. Whatever might be the case in after times, when hatred of the Christians had become a hereditary sentiment, in the second century at least, Jews could assuredly have assigned a reason for the hatred that was in them.

The evidence, then, of the early origin of the Epistle to Diognetus is, to say the least, very far from conclusive. It is not, however, on any negative arguments that Dr. Overbeck rests his opinion; he has also some weighty considerations of a positive kind to urge in support of his own position. In the first place, the way in which heathenism is dealt with in this composition, as a system of mere gross idol-worship, with nothing behind, is not at all after the manner of Justin and the other early apologists. It is a remarkable feature in those writers that, so far from treating the heathenism in which they themselves had been educated with contempt, as something shallow and pitiful, they treated it with all the earnestness of men who held it to be a positive evil—the work of powers in active opposition to God. In short, it may be said that they continued to believe in it; only instead of believing it to be the true religion, they regarded it as the work of evil spirits. Now in our epistle this feature is

entirely wanting. There is no mention here whatever of the demoniacal origin of polytheism, and hence what more natural than to conclude that it belongs to a period when heathenism had become to a much greater extent than could be the case in the second century a thing of the past, and this theory of its origin, though still prevalent, may have lost much of its importance? Still more contemptuous, and therefore more unlike the genuine apologists, is the writer's brief reference to the "vain and silly doctrines" of the philosophers. Justin Martyr, it is well known, maintained (*Apol.* i. 46) that Socrates, Heraclitus, and other virtuous heathen, were Christians, inasmuch as they lived reasonably. Again, another very noticeable feature in this epistle, and one which does not at all harmonize with the accepted view as to its date, is its treatment of Judaism, which it regards as in no sense a revelation, or founded upon any divine interference, but as nothing more than a mere superstition. The theory of the writer, in fact, is that, previous to the manifestation of God through His Son, God was entirely unknown, and the object of his work is to explain to an enquiring heathen why this revelation was so long delayed. Now this view, as regards Old Testament religion, was a common Gnostic view, but in our epistle there is no trace of Gnosticism. On the other hand, how opposed it is to the view of the apologists of the second century! They freely recognised the Old Testament as a divinely inspired book; they claimed a larger right in it than the Jews themselves, inasmuch as they understood it better; they appealed to its prophecies as the argument which they thought was most likely to be satisfactory to their heathen opponents: whereas in the Epistle to Diognetus there is nothing whatever of all this. But perhaps the most striking evidence of a late origin is that which is furnished by a passage describing the relation of the Christians to the society in which they lived. "The Christians," observes the writer, "are distinguished from the rest of mankind neither by country, nor language, nor customs. Nowhere do they live in cities of their own; they have no peculiar form of speech, nor do they lead a life marked by any singularity. . . . They inhabit each one his own country, but as though they had come from a distance. They take part in everything as though they were citizens, and endure everything as though they were foreigners. Every foreign land is to them a home, and their native country a foreign land. They all marry and beget children, but they do not expose their new-born infants. They have a common table, but not a common bed. They are in the flesh, but they live not after the flesh; they live upon the earth, but they are citizens of heaven." And so on, until he adds, "In one word, what the soul is in the body, that are Christians in the world. The soul is diffused through all the members of the body, and Christians are scattered through all the cities of the world. The soul dwells in the body, and yet is not of the body; and Christians dwell in the world, yet are not of the world." Now, to say nothing of the want of earnestness implied in this rhetorical accumulation of antitheses, it may well be asked whether this description does not apply to a time when Christianity was outwardly triumphant and acting upon society as a silent influence everywhere diffused, far better than to a time when it was still engaged in open conflict with heathenism. In the first half of the second century the relation of the soul to the body would hardly have suggested itself as a fitting analogy of the relation of the church to the surrounding world. "The world had then a far too independent existence side by side with Christianity to be regarded as its body" (p. 29). In the theology of the epistle too, Professor Overbeck thinks, he can discover traces of the post-Nicene period. The peculiar terminology indeed of that age we should not expect to find, considering

the form in which the writer has chosen to clothe his thoughts, but there is not a word in his essay inconsistent with the strongest belief in the essential deity of both the Father and the Son, and his doctrine that God can be revealed only through Himself seems to imply an acquaintance with the Nicene theology. This argument, however, is less satisfactory than that founded on the writer's Pauline affinities. The doctrine of the incapacity of man to attain life by his own righteousness is pre-eminently a Pauline doctrine, but after the decease of Paul himself it is one which is not likely to be met with prior to the establishment of the New Testament canon about the close of the second century. It may be doubted, observes our author, whether the system of Paul ever existed as a whole anywhere but in its author's head; for some time after his death it seemed to have perished, and in subsequent centuries it has revived only in isolated parts, one at one time and another at another. The appearance, therefore, in this epistle of so distinctively Pauline a notion is quite inexplicable on the accepted theory of the date of its composition.

These are the principal reasons—no doubt they have lost much in my necessarily imperfect statement of them—which have led Dr. Overbeck to assign the Epistle to Diognetus to the post-Nicene age. My summary of his work would be incomplete unless I added that it is part of his theory that the unknown author himself put Justin's name to his composition, and intended that by Diognetus we should understand the teacher of that name mentioned by Marcus Aurelius. Whether the opinion heretofore in favour will now be reversed, or whether the question will simply come to be regarded as one of the many questions which can never be decided, remains to be seen. Where indications of time are so very faint, and where so much is made to depend on our expectations of what ought to be, whereas the unexpected is so often the true, it is by no means easy to come to a conclusion. In this instance, once the Justinian authorship of the epistle be given up, there is no tradition to stand in the way of a late origin. As the work has never been numbered among Holy Scriptures, the controversy may be carried on without heat, and in any future discussion of the subject, it will be impossible to leave unnoticed Dr. Overbeck's learned and ingenious essay.

ROBERT B. DRUMMOND.

**Biblico-Theological Lexicon of New Testament Greek.** By Hermann Cremer, Professor of Theology in the University of Greifswald. Translated from the German by D. W. Simon, Ph.D., and William Urwick, M.A. Edinburgh: T. and T. Clark, 1872.

THE book of which this is a translation was published in two parts in 1866-67: a second edition appeared at the close of last year. The author was a pupil of Tholuck, and acknowledges himself indebted to Tholuck for the first suggestion of this work. As the title implies, this is not a complete lexicon to the Greek of the New Testament. The author's aim is to illustrate the "language-moulding power of Christianity," as exhibited in the lexical peculiarities of New Testament Greek; to trace the historical development of the technical terms of Christian theology and ethics. Words which are the common property of all writers, sacred and profane, and are used by all without distinction of meaning, have no place in his scheme. That a well executed work of this description must prove of essential service to the student of theology is obvious; but the difficulties in the way of complete success are formidable. No two scholars perhaps will agree in their selection of terms to be explained; for the line which separates words which have really received a Christian tinge from other words, on the exact determination of whose meaning depends the interpretation of

passages of dogmatic importance, is often very faint. On the other hand, the history of interpretation presents many examples of the mischief which results from hastily postulating modifications of meaning; and it is frequently of importance to show that a word has remained *unchanged* in sense. The choice of the vocabulary, however, is the smallest difficulty. The successful execution of a work which combines in itself the lexicon and the commentary requires a union of qualities which is very rare. Unless the writer combine accuracy with breadth of view, delicacy of perception with firmness in the application of principles, he may be a useful companion, but cannot be a trustworthy guide.

Dr. Cremer has produced a work of real value, but it cannot be said that he satisfies every requirement. His vocabulary is incomplete. Making all possible allowance for the difficulty of selection, we cannot but wonder at the exclusion of many words. In the first edition the number of words explained was about 640. The second edition added about 130, *e. g.* πατήρ, βουλή, εὐκρινής, ἐριθεία, καταργέω, μακροθυμία, ταπεινός, πειράζω: the absence of these words from the earlier edition it would be hard to explain. Even now we find no mention of θρησκεία, φρόνημα, εὐλογέω, θέλημα, παιδεία, φύσις, πρᾶξις, σοφία, σημεῖον, σκάνδαλον, μεταμέλομαι, ἐντυγχάνω, μωρός, προσευχή, παράδοσις, πλεονεξία; and this list might be greatly enlarged. The articles on the various words are of very unequal merit: sometimes painstaking, thoughtful, and suggestive; sometimes meagre and superficial. It is strange to meet with an assertion that "ganz selbstverständlich" διαθήκη has the meaning *testament* in Gal. iii. 15, 17; or that ἐλέγχω signifies *convince* or *convict* in John viii. 46, but *reprove* in John xvi. 8. The text of the New Testament is not satisfactorily dealt with: not unfrequently readings respecting which there exists considerable difference of opinion are adopted without remark. Col. ii. 2, for example, is quoted (p. 441 of translation) with the reading, τοῦ μυστηρίου τοῦ θεοῦ ἐν ᾧ κ.τ.λ., no reference being made to any other reading or to the conflict of authorities. The important variants in John i. 18, ix. 35, Rom. v. 1, are not even mentioned. The illustration of the language of the New Testament by means of the Septuagint is worked out with care: the Apocryphal Books, however, are not duly distinguished from the Septuagint proper; nor do they receive their full meed of attention. It is much to be regretted that Dr. Cremer has made little use of the writings of the early Greek Fathers, either for the exegesis of the text, or in illustration of the *usus loquendi*. Notwithstanding these defects, the *Biblico-Theological Lexicon* will prove of great service to the student who uses it with discretion. If he cannot place it among the few books which may be trusted with almost implicit faith, he will receive from it many valuable suggestions and much real help. The second edition is a great improvement upon the first. The additional matter amounts to an increase of forty per cent, whilst the number of words is enlarged by one-fifth. In the first edition the notes on etymology are often crude, sometimes obsolete: in the second this subject is very well handled. Considerable attention is paid to synonyms. It is unfortunate that the English translation has been made from the first edition, having nearly reached completion before the second appeared.

The value of this work for the English reader is most seriously impaired by the unsatisfactory character of the translation. It would be difficult to find a book which more imperatively requires fidelity and clearness of rendering; and yet many of the pages before us (especially in the latter half of the book) might be designed to serve as illustrations of what a translation should *not* be. Fully to substantiate

this serious charge would require much more space than we can command. The most important examples are those which it is most difficult to compress into a small compass. In a long and valuable article on *πίστις*, occupying eleven pages of the translation, at least three sentences out of every five contain some considerable departure from the author's meaning, some distortion, or omission, or unauthorised addition. Of the pages occupied with *διαθήκη* and the doctrine of the Logos, even stronger language might be used. In the article on *ἐλπίς*, the argument on the meaning of the word in Heb. v. 7 is turned into nonsense by the rendering of *Beschränkung* in by *hindrance* to instead of *limitation* or *restriction* in: the whole article is most strangely translated. Such examples as the following speak for themselves: *eine andere Hypothese als Gott*, "an hypothesis distinct as is God" (pp. 405, 406); *es ist ernstlicher, als bisher geschehen, zu würdigen, was Beck sagt*, "it is more strictly correct for us, as has hitherto been held, to argue with Beck" (p. 265); *Bewahrung vor dem Tode*, "preservation before death" (p. 395); *was freilich nicht der Fall ist*, "if this indeed be anywhere the case" (p. 442); *die Beschneidung Gen. xvii. 13*, "the dividing in Gen. xvii. 13" (p. 577); *im Dienste des Heilthums*, "on the side of Heathendom" (p. iv). Some of the most familiar German idioms are repeatedly mistranslated: modifying words (as *fast, zunächst*) are frequently omitted, even when the omission leads to a contradiction of some statement in the course of the same article. Occasionally entire clauses are passed over altogether. Again and again we find the technical terms of theology interchanged; in a theological dictionary this is surely a grave fault. The number of misprints (especially in Hebrew words) is appalling: on p. 333, we notice 12; on p. 335, 11; and in the article on *διαθήκη* (occupying six pages), 50, only eight of which are found in the original. The verification of references, spoken of in Mr. Urwick's preface, has not been very carefully executed: on p. 318, for example, there are four errors which have escaped detection. We earnestly hope that the blemishes which disfigure the translation may be removed in a new edition, and that the praiseworthy effort of the publishers to introduce Dr. Cremer's work to the English public may not be frustrated.

W. F. MOULTON.

#### TO THE EDITOR OF THE ACADEMY.

Glasgow College,  
December 23, 1872.

SIR,—Professor von Otto in the Prolegomena to the second volume of his edition of Justin Martyr, pp. xxvi, xxvii, mentions a Codex Glascoviensis, of date 1453, as containing (on the authority of Haenel) *Justinian Orationes*; and, not having obtained any account of it, he indulges in various conjectures as to the character and contents of the MS.

An inquiry recently made regarding it by Mr. Drummond has led me to look into the MS., which is entered in the catalogue of the Hunterian Library as Haenel gives it, but is in reality not a Codex of Justin at all. It should have been described as "*Justiniani Orationes*." It bears a date at the end, 1453, and contains five pieces in Latin, one of which—the second—has a heading supplied by a later hand, "*Demostenis oratio ad Alexandrum*." The others, I find, on examination, to be the funeral oration of the Venetian admiral, Carlo Zeno, by Leonardo Giustiniani, and Latin translations of the *Third Olynthiac* and *De Chersoneso* of Demosthenes, and of the *Hiero* of Xenophon.

While writing on this subject, I may also mention that the *Evangelistarium Graecum*, numbered Q. 3, 36, in Haenel's catalogue of the Hunterian MSS., is not, as his entry has led many to believe, a duplicate of Q. 3, 35, but a quite distinct and independent MS., which has been bracketed with the other simply in consequence of both having formerly belonged to César de Missy.

WILLIAM P. DICKSON.

#### Contents of the Journals.

**Theological Review**, January.—Mr. A. H. Sayce undertakes "a critical examination of Isaiah xxxvi.—xxxix. on the basis of recent Assyrian discoveries." He shows that not only are the two later sections (xxxviii. xxxix.) fragments inserted without any regard to chronological accuracy, but even the longer one (xxxvi. xxxvii.) is a redaction of at least three documents, and involves a confusion of two distinct invasions of Judah, one by Sargon, and one by Sennacherib. The latter circumstance had been already pointed out by the author, in the *Studien und Kritiken*, 1872, and after him by Professor Schrader, in *Die Keilinschriften und das Alte Testament*, pp. 201, 202. Mr. Sayce further remarks that the invasion and conquest of Judah by Sargon was the occasion of the remarkable prophecy contained in Isaiah x. 5–xi. 16 or xii. 6. It has hitherto generally been supposed that the description in Isaiah x. 28–32 is an ideal representation of what the prophet confidently expected, though his fears were not actually realised. But it is much more natural, now that the contemporary Assyrian records justify it, to suppose that those short vivid sentences were evoked by the sad sights of the moment. And yet with respect to Isaiah xx., which by the way has been adduced as a parallel to the supposed "ideal invasion" in Isaiah x., even Mr. Sayce seems to think that it may only be a description of possible contingencies. An analysis of Isaiah xxxvi.—xxxix. leads the author to the following results. Sargon document:—xxxvi. 1 (partly), 4–7, 10, 14, xxxvii. 11, 13, xxxvi. 9 b. Sennacherib document:—I. (Primary document) 2 Kings xviii. 13 (partly)—18 (? Isaiah xxxvi. 14), xxxvi. 11–13, xxxvi. 15, 18–20 (with xxxvii. 10, 12), xxxvi. 21, 22, xxxvii. 2–4, 6, 7, 36–38. II. (Secondary) xxxvii. 1, 15–20, 5, 21–35. III. xxxvii. 7, "he shall hear a rumour," and 8, 9 a. By the compiler:—xxxvi. 16, 17, xxxvii. 9 b, 10.—By some accident, a ponderous and pretentious, but utterly valueless work *On Mankind and their Destiny*, by "an M.A. of Balliol College," has found its way to the reviewer of philosophical books, and has consequently been treated much more leniently than it perhaps deserved. We are much mistaken if the author's philosophical paraphrase (save the mark!) of Genesis 1 is not borrowed from a recent absurd French work.—Mr. Russell Martineau contributes a note on the Seventh Day of the Creation. He remarks that, "*a priori*, it is very curious that the Elohist, who has no tendency to make use of sacred or round numbers" [in spite of Nöldeke and Kuenen; see however the decades in chs. v. and xi.], "... should manage to bring the history of creation into the sacred compass of seven days." The ideas, too, of God resting from His works, and of tracing the origin of sacred things to the earliest age, are not in harmony with what we know of the Elohist. Besides, there is no subsequent mention in Genesis of the sabbath. An analysis of Gen. ii. 1–3 shows that the language is not Elohist. Lastly, "a comparison with Ex. xx. 8–11 makes it evident that our writer is the same as the writer of that version of the Ten Commandments;" and Bishop Colenso (*On the Pentateuch*, pt. vi. § 217, and app. § 107) has shown good reason for regarding the latter as the work of the Deuteronomist. So far then the evidence is against Kuenen's view of the lateness of the Elohist writer. We quite agree with Mr. Martineau that this result follows inevitably from Bishop Colenso's analysis of Ex. xx. But we think he might have gone a step further. If the Elohist had no partiality for sacred numbers, it follows that the recurrence seven times over in Gen. i. of the formulae "And it was so," "And God saw that it was good," and the consequent alteration of the texts are due to some other writer. (Cf. Schrader, *Studien zur Kritik u. s. w.* pp. 12–22.) That writer is not improbably the Deuteronomist, whose free handling as an editor is well known.—T. K. C.

**Theologisch Tijdschrift**, January.—Strauss' *The Old Belief and the New*, by L. W. E. Rauwenhoff. [Expresses great dissatisfaction at the uncritical estimate of the elements of Christianity, which would better have suited the age of Reimarus.]—Contributions to the determination of the relative antiquity of the historical portions of the "Book of Origenes," by W. H. Kusters. [Reiterates with some novelty of detail, and with special application to Colenso, the arguments of Kuenen for a late origin of the portions referred to.]—On some recent important contributions to the Johannine literature, by M. A. N. Rovers. [I. On the researches of Keim, Scholten, Hilgenfeld, as to the tradition which places the Apostle John in Asia Minor. II. On works of Hilgenfeld and Vigilius relative to the genuineness of John xxi.]—Professor H. de Groot on Zarathustra, by C. P. Tiele. [Reply to objections.]—Notices of Alford on Genesis and Exodus [a crude and inconsistent work], and other Biblical works, by Kuenen; also of Schrader's two books on the cuneiform inscriptions. [See *Intelligence*, PHILOLOGY.] Also of Ziegler's *Irenaeus*, and Hugues' *Life of Antoine Court the Huguenot*; by Rauwenhoff.

### Physical Science.

**The Conifers and the Gnetaceae.** [*Die Coniferen und die Gnetaceen.* Eine morphologische Studie. Von Dr. E. Strasburger.] Jena : 1872.

PROFESSOR STRASBURGER was already well known as the author of an important memoir on the fertilisation of *Coniferae* (*Die Befruchtung der Coniferen*, Jena, 1869). He has now published the results of a detailed and comparative study of all the genera comprised in that order, as well as *Gnetaceae*. The prominent Darwinian tendencies of the writer have led him to correlate his numerous observations in accordance with the theory of Descent, and his doing so adds additional interest to investigations which independently of this are of great importance. He constantly keeps in view the principle that morphological characters are the direct expression of the genealogy both of individual forms and of the groups to which they belong. It therefore follows that in its real meaning Classification, if only all the necessary data were known, would involve the genealogy of all organic beings, past and present.

The same principle applies not merely to the individual, but to the organs of which the individual is the aggregate. The history of the development of organs must therefore be regarded as the principal criterion of their homology ; and characters depending on position or function become, from this point of view, of secondary importance. A comparative enquiry into the mode of development of a large number of species closely related to each other could not but lead to a more complete knowledge of their affinities than had been already acquired. The study, for instance, of the development of *Welwitschia*, proving the great analogy of its "corpuscles" with the embryonal vesicles of other Phanerogams, reveals a new connecting link between the latter and Gymnosperms.

Again, the application of the same method enables the author to elucidate the still unsettled question of the morphology of the ovule in Gymnosperms. He briefly sums up (p. 238) as follows the results of his investigations :—

i. The female flowers of *Coniferae* and *Gnetaceae* are transformed buds. ii. Each of these flowers is reduced to a naked ovary, destitute of any distinct perianth homologous with that existing in other Phanerogams.\* iii. The single envelope of the flower of *Coniferae* is homologous with the outermost of the three surrounding the ovule in *Gnetaceae*, which, being homologous with the carpels of superior Phanerogams, must be considered as an ovary. iv. This ovary contains a single ovule, which is naked in all *Coniferae*, whilst in *Gnetaceae* it is protected by two integuments. v. The integuments in *Gnetaceae* are homologous with the ovular integuments in the higher Phanerogams, though their evolution takes place from below upwards. vi. These envelopes must be looked upon as foliar productions, both in *Coniferae* and *Gnetaceae*. vii. The nucleus of the ovule is formed by the extremity of the floral axis. viii. In both *Coniferae* and *Gnetaceae* the ovary is formed by two carpellary

leaves, which are primitively distinct, but become coalescent by the subsequent growth of their basal portion ; in some rare cases, however, they seem from the first to be completely united. ix. The integuments of the *Gnetaceae* being equally developed all round the ovules they enclose, each of them may be considered as a single leaf. x. Any foliaceous formation, such as makes its appearance in many *Coniferae* between pre-existing leaves—as, for instance, the fructiferous scale in *Abietinae* or the cupule in *Taxaceae*—is an outgrowth of the axis. There are no such organs in *Gnetaceae*.

From the above conclusions it appears to Professor Strasburger impossible to continue the use of the term Gymnosperms to include *Coniferae* and *Gnetaceae* in opposition to that of Angiosperms, comprising all other Phanerogams.

Still, since Cycads, Conifers, and *Gnetaceae* differ widely from other flowering plants in having "corpuscles" instead of embryo vesicles, Professor Strasburger deems it advisable to retain them as forming a distinct division in the Vegetable Kingdom, but under less objectionable designations. Influenced by geological considerations, he therefore proposes the terms Archisperms and Metasperms as substitutes for those of Gymnosperms and Angiosperms respectively.

But the studies contained in this memoir have not been confined to the reproductive system. They treat with equal completeness of roots, buds, leaves, and germination. After having carefully detailed his observations upon these points, Professor Strasburger endeavours to show how Archisperms may be grouped together when the various forms of organs are considered as originating from common ancestral sources. Assuming that hypothesis, all Archisperms, fossils included, may be linked together by a genealogical tree. Starting from Cycads, the stem splits into two principal branches : one of these, formed by the *Araucariaceae*, ends with such genera as *Pinus*, *Cedrus*, &c. ; the other, composed of *Taxaceae* and *Gnetaceae*, terminates with *Welwitschia*.

C. DE CANDOLLE.

### Notes of Scientific Work.

#### Geography.

**Oceanic Circulation.**—In the 138th part of the *Proceedings of the Royal Society*, Dr. Carpenter publishes the results of scientific researches carried on during the months of August, September, and October, 1871, in H.M. surveying-ship *Shearwater*. The Mediterranean area was again the field of examination, and among the chief objects proposed was the investigation of the temperature and density of the eastern basin of that sea, to ascertain whether its water corresponds in these respects with that of the western division. The temperature-phenomena of this basin were found to agree in all essential points with those previously determined for the western, though a somewhat higher temperature prevails throughout, due partly to a lower latitude, to the absence of any mountain barrier like that of the Atlas intervening to cool the hot winds of the Sahara, and to a greater removal from the supply of the colder water of the Atlantic entering at the Strait of Gibraltar. The density of the water in the eastern basin is also higher, and near the Libyan coast in 365 fathoms a specific gravity of 1.0302 was recorded. In discussing these results, Dr. Carpenter finds a remarkable contrast between the temperature-phenomena of inland seas and those of the open ocean, founding upon this a strong argument in favour of the doctrine of a general oceanic circulation. The temperatures of the lower strata of the Mediterranean have been found to be nearly uniform throughout, showing clearly that depth *per se* does not give rise to any change in the temperature of sea water occupying a basin which has only a superficial connection with the ocean. In the western and eastern basins the uniform temperatures of the lower strata, 54½° and 57° respectively, agree so well with the mean temperature of the crust of the earth in these regions, and with the lowest winter temperature of the surface—whilst the comparative shallowness of the Strait of Gibraltar effectually prevents the admission of any considerable body of water of a temperature below 54½° from the depths of the Atlantic outside—that "we may fairly assume these temperatures to be the normal of the latitude ; and since in the eastern Atlantic, outside the strait, the whole mass of water below 1000 fathoms has a tempera-

\* It will be seen that Professor M'Nab (*Academy*, vol. iv. p. 13), from the examination of *Welwitschia*, dissents from some of these conclusions.—Eds. *Academy*.

ture from  $16^{\circ}$  to  $18^{\circ}$  below this normal, which cannot be attributed to the action of surface cold in the locality itself, the inference seems irresistible that this depression must be produced and maintained by the convection of cold from the Polar towards the Equatorial area." This view is fully confirmed by observations recently made in the Red Sea, which is cut off by the shallow Strait of Bab el-Mandeb from the deep cold stratum of the Arabian Gulf, and in some parts of which a uniform temperature of  $71^{\circ}$  has been found from the surface throughout; and the deep temperatures of the Sulu Sea, which, though not ostensibly inland, is shut in by reefs and shoals on all sides, so that it has only a superficial communication with the ocean, present exactly the same contrast with those of the China Sea that the temperature-phenomena of the Mediterranean show when compared with those of the Atlantic. Another important object of investigation in the eastern Mediterranean was to ascertain, by analysis of the gases contained in the deepest water, whether the proportions of oxygen, nitrogen, and carbonic acid correspond with those which had been found in the northern Atlantic to be compatible with the presence of an abundant Fauna; or whether, as Dr. Carpenter suggested in a former report, the stagnation of the deepest part of the Mediterranean basin, in consequence of the want of thermic circulation, is attended by such an excess of carbonic acid and diminution of oxygen as is incompatible with the existence of animal life. The latter view appears to have been fully proved by the observations made. The composition of the specimens of deep water obtained agreed very closely with one another, the percentages being approximately as follow: oxygen, 5; nitrogen, 35; carbonic acid, 60. "Thus it appeared that very nearly the whole available oxygen had been converted into carbonic acid, so that, whilst the proportion of oxygen to carbonic acid was never in the open ocean less than one-third, it was here no more than one-twelfth; a difference fully adequate to account for the paucity of animal life on the deep bottom of the Mediterranean." The dredgings carried on between Sicily and the coast of Africa showed that below a depth of 150 fathoms animal life was very scanty, and Dr. Carpenter is disposed to believe that in the Mediterranean the existence of animal life in any abundance at a depth greater than 200 fathoms will be found quite exceptional, presenting in this respect a striking contrast to "those Marine Paradises which are continually met with in the eastern and northern Atlantic at depths between 500 and 1200 fathoms."

**Northern Siberia.**—A forthcoming part of *Petermann's Mittheilungen* for this year contains one of those exhaustive geographical compilations which have rendered this journal so valuable in its special branch. The subject is the northmost land of Asia between the mouths of the Yenisei and Lena rivers; and upon the map the routes of every traveller in this far corner of the *tundras*—from the earliest in 1736 to that of Middendorf in 1843—have been traced with the greatest care. The delineation of Middendorf's journey, the latest scientific movement in this region, is specially valuable, since it has never previously been laid down with critical accuracy. The compilation was undertaken for the leaders of the Austrian Arctic Expedition, now believed to be wintering in the neighbourhood of N.E. Cape, to show them how much had been done, and how much more remained to be accomplished, in the way of exact determination of position in this region.

### Zoology.

**Journal des Museum Godeffroy.** Part I.—The issue of the first number of this magnificent journal must certainly be reckoned as an important event in the scientific world, and one which lays it under deep obligation to the munificent originator of it, Mr. Caesar Godeffroy, a wealthy merchant and large shipowner of Hamburg. Mr. Godeffroy has for some years been collecting specimens of natural history from Australia and the South Seas, and for their preservation for the purposes of education and research has established the museum which bears his name. In the short preface of this part we are told that the founder of the museum originated his admirable plan ten years ago; the captains in his service were instructed to collect specimens and report their observations and experiences on geographical points of interest; collectors were sent out on special missions; and artists employed to record on the spot those delicate variations of form and colour which are not unfrequently altogether lost in a dried skin or plant. The new specimens have been distributed through Germany, England, and France to scientific men for description, and their reports, which have hitherto been published in memoirs and journals in several countries, are in future to appear in the new journal. Dr. Eduard Gräffe, who has recently returned from the Pacific, after a ten years' scientific exploration devoted to the objects of the museum, is one of the first who contribute. The papers contained in the present number are:—The Topography of the Navigator Islands, by E. Gräffe, illustrated with maps, sections, and views; the Lagoons of the Ebon group in Marshall's Archipelago, by J. Kubary, who has compiled a vocabulary of the native language spoken at Ebon Island; the Bird-skins collected at Huahine, by E. Gräffe, illustrated with an excellent coloured plate of *Ptilinopus rarotogensis*; Contributions to the History of the Fern Flora

of the Pelew Islands and of Cook's Islands, by C. Luerksen; and Examination of Diatoms from two localities of the South Seas, with drawings, by O. N. Witt.

**Tornaria, the Young Condition of Balanoglossus.**—Professor A. Edwards states, in the November number of the *American Naturalist*, that the position of Tornaria was formerly considered to be that of a star-fish embryo, its analogy to Brachiolaria being complete. In 1870, however, Metznikoff was fortunate enough to be able to assign to Tornaria a later stage of development, when to his astonishment it changed into an Annelid. In view of the affinities first suggested by Huxley to exist between the Worms and Echinoderms, it was of course very important that Metznikoff's observations should be repeated, and, if possible, the genus of Annelid, of which Tornaria was the young, accurately ascertained. The Annelid raised by Metznikoff was most peculiar, and, in absence of other evidence, he suggested the possibility of its being a young Balanoglossus. Professor Edwards states he has been able during the last summer to raise Tornaria and to obtain young Annelids somewhat older than those observed by Metznikoff; and at the same time to trace the development of the branchiae as diverticula from the oesophagus, as well as to find the young Annelid of Tornaria, a species of Balanoglossus (of which the adult is quite common at low-water mark at Newport and at Beverley, Mass.), but slightly older than those raised directly from the Tornaria stage.

**Anatomy of the Limulus.**—At the last meeting of the Académie des Sciences, M. Blanchard read a report on the memoir of M. Alphonse Milne-Edwards on the Limulus. It corroborates the observations made long ago by Professor Owen that the nervous centres are contained in the ventral artery, and are in consequence in direct contact with the nutritive fluid. He is unable, however, to give any explanation of this exceptional phenomenon. The Limulus was formerly regarded as belonging to the Crustacea. More recently many naturalists have classed them with the aquatic Arachnida. M. Alphonse Milne-Edwards proposes to form a separate sub-class, to which he applies the name Merostomata.

### Chemistry.

**The Effect of High Temperature on Diamond and Graphite.**—An abstract of a paper on this subject by Professor G. Rose appears in the *Jahrbuch für Mineralogie*, 1872, part 8, p. 873. He finds that diamond undergoes no change either at the temperature at which cast iron melts or in the hottest part of a porcelain furnace; if however it be exposed to the temperature of molten wrought iron, it commences, while retaining its form, to change into graphite. The depressions produced on the face of the diamond by partial combustion are very remarkable; they are triangular, and have such a position on the octahedral faces that their sides are parallel to the edges of the octahedron; they represent faces of a ikositetrahedron. The other triangular depressions naturally occurring on crystals of diamond, and due to faces of the dodecahedron, are not to be confounded with the above. The so-called carbonado that occurs in rounded masses in Bahia behaves differently: at a white heat it throws off fine dust-like particles. It is a somewhat porous form of diamond, and contains a small amount of some foreign substance. The foliated variety of graphite burns far less readily than diamond; the compact kind, on the contrary, is more easily combustible.—The same part of the *Jahrbuch* contains a paper by Professor Knop on his microscopic and chemical examination of the xanthophyllite of the Urals, in which v. Jeremejew found vast numbers of microscopic diamonds. He states that these diamonds have no existence. He finds that the forms which have been declared to be diamonds are really cavities in the rock arising from the removal by solution of some enclosed crystals, and has succeeded in producing the same appearance in a piece of apparently homogeneous xanthophyllite by treating it with acid.

**Electrolysis of Itaconic Acid.**—The changes brought about by passing an electric current through a concentrated solution of the potassium salt of this acid have been determined by G. Aarland in Professor Kolbe's laboratory, and are described in the *Journal für praktische Chemie*, 1872, No. 16, p. 286. The gaseous products are allylene and carbonic acid; while the solution, after the operation was concluded, was found to contain acrylic acid and mesaconic acid.

**Divinyl.**—This name has been given by Pfankuch (*Journal für praktische Chemie*, 1872, No. 13, p. 113) to a hydrocarbon having the composition  $(C_2H_2)_2$ , or  $C_4H_4$ , formed by the distillation of sulphur and barium acetate. During the operation an oily body passes over, which solidifies for the most part on standing; rhombic crystals of sulphur and fine needles of the sulphur compound of the new body separate. On removing the acetone with water, and heating the crystals and oily portion together at  $100^{\circ}$  with finely divided copper or lead, the sulphur is withdrawn. By subsequent distillation the oily body, divinyl, passes over at  $20^{\circ}$ . Whether crotonylene is identical or only isomeric with divinyl has not yet been determined.

**Action of Bromine on Ether.**—This reaction has been studied by Schützenberger (*Berichte der Deutschen Chemischen Gesellschaft zu*

Berlin, 1872, No. 19, p. 1056). By placing bromine in contact with absolute ether in a freezing mixture, there is formed a red crystalline body which melts at  $22^{\circ}$ , and has the composition  $[(C_2H_5)_2O]_2Br$ . It deliquesces in moist air, but gives off no bromine. In the course of time it undergoes spontaneous decomposition: water immediately breaks it up into the two constituents. If it be heated to  $100^{\circ}$  in a closed tube, the contents of the tube form two layers, the upper being a solution of hydrobromic acid, the lower consisting of bromal  $C_3HBr_3O$  and an insoluble substance, which has a boiling point of  $175^{\circ}$  and the formula  $C_3H_2Br_2O_2$ .

**Black Yttrotantalite.**—An elaborate examination of the minerals bearing the name of yttrotantalite has convinced Professor Rammelsberg (*Chemisches Centralblatt*, 1872, No. 50, p. 792) that the dark-brown and yellow yttrotantalite of Ytterby, the grey variety of Gamle Kararfvet, and the tyrite and bragite of Arendal, have the composition of the fergusonite of Greenland, are, in short, compounds of the form  $R''Nb_2O_6$ , with varying amounts of water. The probability of the correctness of this view had been suggested by a previous examination of individual crystals of these minerals. Nordenskjöld found the black yttrotantalite of Ytterby to have a crystalline form quite different from that of the varieties mentioned, and in this case retained the old name for the mineral. The black kind, as regards the tantalum and niobium acid which Rammelsberg has found in it, occupies a place intermediate between the fergusonite group and the normal  $R''Ta_2O_6$  of tantalite, niobite, polycrase, &c., in having the formula  $R''Ta_2O_6 \cdot R''Nb_2O_6$ ,  $R''$  being chiefly yttrium, erbium, cerium, and calcium.

**Diabase.**—A long paper, contributing much valuable information respecting the history of diabase, and giving several new analyses of well-defined specimens, has been published in the *Journal für praktische Chemie*, 1872, No. 15, p. 227, by T. Petersen and R. Senfter. The following are the chief results of their investigation:—1. Diabase always contains a triclinic alkali-felspar, which in the specimens analysed was oligoclase, as well as in most cases a lime-felspar, probably labradorite. 2. A second constituent is augite, the amount of lime in which is about equal to that of the magnesia and iron oxide taken together. 3. A constituent almost as constant, and derived from the augite, is a ferro-magnesian chlorite, the composition of which accords with the usual formula from this mineral. 4. Titaniferous magnetite and apatite are always present. 5. Calcite also, though often in very small amount, is constantly met with in this rock.

**The Amount of Ammonia in Snow.**—This has recently been determined at Munich by Vogel (*Der Naturforscher*, 1872, No. 50, p. 406) in snow of different temperatures. Freshly fallen snow at  $0^{\circ}C$ . furnished water that contained 0.003 gramme to the litre; snow at  $-3^{\circ}C$ , 0.002; and snow that fell at  $-9^{\circ}$  to  $-15^{\circ}$  was entirely free from ammonia. Snow that had lain twenty-four hours on a field which had been manured the previous autumn was found, when melted, to contain 0.012 gramme per litre of ammonia. Other snow that had been for twenty-four hours on the zinc roof of a house had absorbed 0.009 gramme.

**A New Glycol.**—By reducing erythrite with formic acid, Henninger (*Revue scientifique*, 1872, No. 26, p. 612) has obtained a glycol of the form  $C_4H_8(OH)_2$ . By distilling the formic ether of erythrite, it splits up in the following manner:—

The new glycol, thus produced, boils at  $199-200^{\circ}$ , and, when heated with acetic anhydride, forms a diacetate that has the boiling-point  $202-203^{\circ}$ . By saponifying the monoformic ether, which boils at  $190-192^{\circ}$ , with baryta, the new glycol is easily obtained in a state of purity.

### History.

**The Great Harris Papyrus.** [*Der grosse Papyrus Harris. Ein wichtiger Beitrag zur ägyptischen Geschichte, ein 3000 Jahr altes Zeugnis für die mosaische Religionsstiftung enthaltend.* Vortrag gehalten im philosophisch-historischen Verein zu Heidelberg von Dr. August Eisenlohr, Docent der ägyptischen Sprache an der Universität Heidelberg.] Leipzig: T. C. Hinrichs'sche Buchhandlung, 1872.

THE great Harris Papyrus formed a part of the collection made by Mr. A. C. Harris, late British consul in Alexandria, and recently bought by the Trustees of the British Museum. When found, it measured no less than  $40^m50$  in length by  $0^m425$  in breadth: it is now divided into seventy-nine pages. It is dated from the 32nd year of the reign of Rhamse III., son of *Necht-Seti*, and second king of the xxth dynasty. Its most important part has been just published by Dr. Eisenlohr, and contains an account of some historical facts connected with the Exodus.

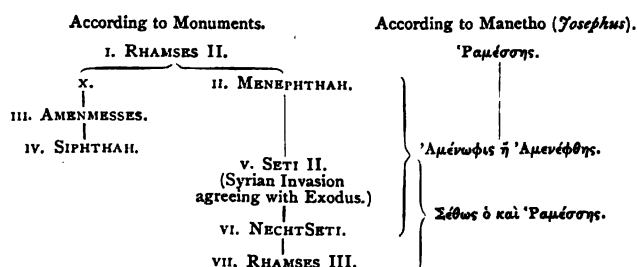

Our knowledge of the Exodus is derived chiefly from two sources: from the Bible, which gives us the Jewish version of the event, and from Manetho's historical work, the fragments of which contain the Egyptian tale of the same event. Manetho represents the Israelites as being leprous outcasts, who, after having been thrown into the Tourah quarries by a certain king Amenophis, were afterwards benevolently released from their bond of servitude and sent to Avaris, the ancient Hyksos stronghold. He identifies Moses with Osarsiph, a priest of Heliopolis, whom they appointed for their leader and took an oath to obey in all things. He then proceeds to relate that Moses, after giving to them laws altogether opposed to the institutions and customs of the land, asked the Shepherds to join in a war against Egypt; which they did accordingly, and committed atrocities far beyond those attributed to the first Hyksos invaders. Amenophis withdrew into Ethiopia with his son Sethos, also called Rhamesses, returned with a great army, and finally ejected the Lepers from Egypt into the borders of Syria, where they settled by themselves. Before Dr. Eisenlohr's publication it was a question with a few critics whether Manetho's tale was a mere reminiscence of Scripture or contained facts derived independently from the sacred annals of the temples. We need now but to read side by side Manetho's fragment and the Harris manuscript to become convinced that Manetho borrowed his version of Exodus from purely Egyptian sources. What remains to be done is to examine the circumstances of his narrative and to compare them with the data of the original monuments, thus discriminating what is historical in it from what is legendary.

And first, about the names. 1. The Israelites are said to be *Lepers*. One of the epithets the Egyptians were so fond of throwing at their enemies was *AATU*, *Pestiferous*, *Lepers*, *Cursed ones*.\* It is highly probable that Manetho, seeing the Israelites so termed in old documents, mistook the epithet for an indication of real malady, and transformed the *Aatu* of the monuments into the Lepers of his history. 2. Moses is called *Osarsiph*, an Heliopolitan priest. Osiris' name forms the first element of *Ὀσαρσίφ* or *Ὀσαρόνφ*; as for the

\* Chabas, *Mélanges égyptologiques*, 2<sup>e</sup> série.

termination -σις, -ουσις or -σουσις, it is to be found in Μεντέ-σουσις or Μεθέσουσις and Σεκούσις. Μεντέσουσις, borrowed from the vith Manethonian dynasty, answers to the hieroglyphical MENT-EM-SA-W, the god *Ment* is behind him, the god *Ment* protects him: Σεκούσις is the Egyptian SEBEK-EM-SA-W, the god *Sebek* is behind him, the god *Sebek* protects him. I think it is safe to consider the final -ουσις or -σουσις in 'Οσάρ-ουσις as being the same as the Egyptian locution EM-SA-W, behind him, so that 'Οσάρουσις would be OSAR-EM-SA-W, *Osiris* is behind him, *Osiris* protects him. The same process of formation appears in ANUB-EM-SA-W, HOR-EM-SA-W, MÛT-EM-SA-W. 3. The invaders of Egypt are called *Shepherds*. *Shepherds* is the translation of the name MENTIU (cf. C. μνοει, *pascere*), which is given not only to the Hyksos, but to all Asiatic peoples, from the time of the XVIIIth dynasty to the fall of the Egyptian nationality. The Hyksos were *Mentiu*; so were the Syrians of king Rhamses III. The name of *Shepherds* given to Moses' auxiliaries and the confusion established between them and the Hyksos are thus explained easily, and correcting Manetho's present text according to the preceding remarks, we may gather from his narrative that "a tribe of public slaves, such as were the Israelites of this time, having been released from the quarries and quartered in the neighbourhood of Avaris, revolted under the command of one *Osar-em-sa-w*, the same as Moses. Those *Aatu* sent for help to the *Mentiu*, or Asiatic people, who invaded Egypt and nearly succeeded in conquering it."

According to Manetho, this happened during the reign of one Amenophis or Amenephtes, who has been identified with *Menephtah hotep-hi-mâ*, son of Rhamses II. Sesostris. I have not space enough to develop the considerations that have led me to hold Amenophis, not as Josephus would have it, as being an *invented* king, but as condensing in itself the story and names of two or three different kings, and to sketch thus the royal pedigree of the XIXth and XXth dynasties:—

The reasons for this restitution are to be found in a *Lettre à M. d'Eichthal sur les Circonstances de l'Histoire d'Égypte qui ont pu favoriser l'Exode du peuple hébreu*, read before the Académie des Inscriptions et Belles-Lettres of Paris, and shortly to be published in the *Comptes rendus* of the same.

These results differ slightly from those of Dr. Eisenlohr. According to him, "Josephus' Amenophis is to be sought in Menephtah Seti II., and young Sethos is no other than Seti-Necht." But I am happy to see that we agree in placing the Exodus not, "as, is usually supposed, under the reign of Menephtah I., but in the reign of his successor Menephtah Seti II." This is the only time at which the kingdom of Egypt was weak enough to allow a tribe of public slaves to escape with impunity into the wilderness; while the necessity of Israel wandering for forty years is more than sufficiently explained by the subsequent triumphs of Rhamses III. and his conquest of Syria. That conquest and the wars that preceded it will soon be recounted by Dr. Eisenlohr from new documents, the principal of which is certainly the great Harris Papyrus itself.

G. MASPERO.

Roman Public Law. [*Handbuch der Römischen Alterthümer*. Von J. Marquardt und Th. Mommsen. Erster Band.] (Also entitled: *Römisches Staatsrecht*. Von Th. Mommsen.) Leipzig, 1871.

THE second title gives the more accurate notion of this book, which, professedly forming part of a corrected edition of the well-known *Handbook* of Bekker and Marquardt, is really a new and most important work on Roman Public Law. The present volume treats of the Magistracy in general: the second, as we learn from the preface, is to be on the several Magistracies; and a third is to embrace the *civitas* and the Senate. To those who are acquainted with the author's *History of Rome* it will be enough to say that the plan embraces everything which could be desired to supplement that work. Historical students have sometimes complained of Mommsen's "dogmatism": of his habit of giving his conclusions without argument, and even without references to the sources from which they come. The complaint was not perhaps wholly groundless: for though Mommsen has seldom advanced anything which he has not discussed, these discussions are scattered through his various minor works and occasional papers (such as his books on the Tribes, on the Roman Chronology, on the Coinage—to say nothing of the notes to the *Corpus Inscriptionum*), a field of literature which lies beyond the patience and even the bibliographical knowledge of most readers. The present work is admirably suited for all who wish to penetrate beneath the text of the standard histories. The minute learning here shown, the skilful selection and arrangement of authorities, the power of dealing with masses of detail, are qualities at least as remarkable as the eloquence and imagination of the *History of Rome*.

The aim of the work, as the preface explains, is, as far as possible, to extend to Roman Public Law the systematic treatment of which the Private Law is so conspicuous an example. The great merit of Mommsen's *History* lay in his profound understanding of Roman legal conceptions, and his thorough appreciation of their ubiquity and permanence in Roman life. He now presents us with the same thought worked out from the scientific instead of the historical side. The different periods—Regal, Republican, Imperial—are not kept apart, but the materials are arranged according to the filiation of the conceptions upon which they depend. Thus the whole of the present volume is devoted to features common to different Magistracies. Some repetition is unavoidable under this plan; but, on the other hand, there are many points upon which a flood of light is thrown by the mere bringing together of analogous matter.

The difficult subject of the Auspices is first treated. The intimate connection between Auspices and other attributes of the Magistracy is amply brought out, and a good explanation is given of the *Obnuntiatio*—a mode of political opposition which obtained a brief and singular importance towards the end of the Republic. Why it was resorted to rather than the older *Intercessio* is a question which seems to be as yet unanswered.

The subject of the Magistracy proper is introduced by a careful analysis of the conceptions denoted by *magistratus*, *imperium*, and *potestas*. Of these, *imperium* may be regarded as giving the source from which all Roman government ultimately springs—the notion of supreme unrestricted command. The modifications which were gradually introduced—*provocatio*, shortening of tenure, division of functions—are always carried out under forms which show an almost superstitious tenderness for the original institution. Mommsen distinguishes three processes by which the *imperium* was encroached upon: viz. (1) giving practically independent authority to "minor" magistrates; (2) creating more than

one holder of the *imperium*, in other words, the "collegiate" principle; and (3) admitting plebeian magistrates to equal or greater powers, that is to say, allowing an association not coextensive with the community to elect magistrates and pass laws which should have all the attributes of the magistrates and laws of the community. The first of these processes is that by which the wider conceptions of *magistratus* and *potestas* grew out of the original *imperium*. The second is that through which the plurality of supreme magistrates was adapted to accomplish the two conflicting tasks of every community—government in peace and in war. Mommsen has drawn out the various applications of this principle with the most careful elaboration, and has thus enabled us to appreciate the political genius by which an institution in appearance so cumbrous, and even self-destructive, was moulded by the help of a few distinctions—such as "home" and "foreign," original and delegated *imperium*, &c.—and made to yield the most flexible as well as the most vigorous government in all history. The constitutional doctrines thus obtained are not, indeed, new, for they are familiar in their general outlines to the readers of Mommsen's *History*. But in his present work we are able for the first time to understand and admire that union of logical consistency with wise adaptation to varying circumstances which constitutes the peculiar strength and glory of the Romans.

The most interesting part of the volume will probably be found to be the discussion of *Intercessio* (pp. 209–237), especially if read in connection with the expositions previously given of *par majorve potestas* (pp. 56–59) and the *coercitio* of the magistrates in its different forms (pp. 121–141). The distinction made between the right of forbidding (inherent in *major potestas*) and the right of *intercessio*; the treatment of both rights as belonging theoretically to magistrates in general, though of especial importance in the case of the tribunes; the proof that the tribune has *major potestas* compared with the consul—these are the main points which give the exposition its striking and convincing character. We can now understand, for instance, why the Senate applied to the tribunes when Appius Claudius the Censor refused to give up his office at the end of the legal period, and also why the support of three tribunes protected him in his unconstitutional course. Tribunician "intercession" was only available against particular acts, and only on appeal. Any tribune, however, as holder of *major potestas*, could order him to abdicate, and could arrest him (*coercere*) in case of his refusal. But any other tribune, as *par potestas*, could (not forbid, but) "intercede" against his colleague, and so quash the decree or command. By thus separating the positive from the negative action of the magistrates, Mommsen has cleared up many difficulties, especially regarding the degree to which a tribune was dependent upon the support of his colleagues.

The right of the Magistrates to summon the Comitia and the Senate (*jus agendi cum populo, jus referendi*) are treated in an equally luminous and systematic manner. The two rights, it is shown, are essentially correlated, although the tribunes had only the *jus agendi cum plebe*; the fact being that the tribunes never needed the right to summon the *populus*, because full powers were early given to the assembly of the *plebs*. Regarding the election of magistrates, Mommsen adopts (from Mercklin) the suggestion that magistrates with *imperium* had at first the right to nominate colleagues. Under this principle he explains the right of the consul to name a dictator, and promises to prove that the dictatorship is an original part of the republican constitution. The co-optation of the tribunes is historically attested, and in this respect, as in others, it is probable that the plebeians followed patrician precedents. The question when and how

the tribunes obtained the *jus referendi* is reserved for the second volume.

There is abundance of new and interesting matter in the sections which treat of the attendants on the magistrates (*apparitores*), such as scribes, lictors, *accensi*, of the *insignia* of office, and of the honorary rights attached to the holding of office. All such details, with the Romans, were so pervaded by their constitutional doctrines that they are often more instructive than direct statements; and the author's immense knowledge of inscriptions is especially applicable to subjects which lie beneath the surface, as it were, of ordinary historical narrative. We may notice especially the account of the *sella curulis* (pp. 311, ff.) and of the distinction between *ornamenta consularia* and *adlectio inter consulares* (pp. 369, ff.). Questions of this kind, in Mommsen's hands, enable us to understand why nothing is beneath the notice of philology: for a trifling detail of costume or etiquette may be the expression of ideas which have permanently moulded human society.

D. B. MONRO.

Early Roman Law. The Regal Period. By E. C. Clark, M.A. London: 1872.

THIS little book will form a convenient introduction to a department of philology of great and increasing interest, viz. that which deals with the origin and growth of legal ideas. Mr. Clark modestly says that "for readers who may wish to acquire any substantial knowledge of the subject *la sauce vaut mieux que le poisson*"—the fish being his own, the sauce that of Varro and Festus. The text, however—the fish in this comparison—is not unsubstantial, though perhaps somewhat scanty. It is written in a lively style, not always free from obscurity. As Mr. Clark tells us that he has postponed the Decemviral legislation "to a time of greater leisure," we may look upon the present publication as a specimen of his studies rather than a complete work. The chief matters discussed are, the *leges regiae*, the process in the case of *perduellio*, the quaestorship, the *legis actiones*, and the oldest forms of conveyance, adoption, and testament. The process of *perduellio*, with the typical case of Horatius, is happily treated; the idea of allowing appeal in case of murder (*paricidium*) by the fiction of regarding it as treason (acting as a public enemy or *perduellio*) is eminently Roman. The value of the fragments quoted from so-called *leges regiae* is impaired by the extreme uncertainty regarding their date; in any case they are hardly more than regulations of pontifical ritual. Nevertheless they contain many traces of undoubtedly ancient custom, and as such they are skilfully used by Mr. Clark. The treatment of the *legis actiones* is slight; probably Mr. Clark will return to it in connection with the Twelve Tables. On *mancipium* and *nexum*, adoption, testation, &c., there is not much added to the exposition in Sir Henry Maine's *Ancient Law*; but it is convenient to have the authorities arranged and digested. On the side of constitutional history Mr. Clark is not very strong; his knowledge both of the sources and of the modern literature is obviously inferior to that shown in Mr. Seeley's admirable *Examination*. An instance of this is his criticism of Mommsen's view (adopted by Mr. Seeley) that the *patres* in the phrase *patrum auctoritas* are not the senate simply, but the patrician part of the senate. He there confines himself to one passage of Livy (vi. 42), whereas the view in question rests upon several other notices, such as the distinction drawn between *patres* and *conscripti*, and the parallel of the *interrex*, who was apparently chosen, not by the senate at large, but by an assembly of patrician senators. Probably Mr. Clark is not acquainted with the discussion of this curious topic in Mommsen's *Römische Forschungen*.

D. B. MONRO.

**The Roman Blood Phials.** [*Ueber den gegenwärtigen Stand der Frage nach dem Inhalte und der Bedeutung der römischen Blutampullen.*] F. X. Kraus.

The author, a moderate Roman Catholic, professor at Strassburg, well-known for his archaeological enquiries, here sums up the argument for some of the phials found in the catacombs containing blood, while allowing that most of the red is merely oxide of iron. He thinks they may have been deposited with the bodies of martyrs, "non vindicati," as a means of later identification when the persecution was over, in opposition to Le Blant's view that they were deposited as a kind of amulet in the graves of other Christians, who looked on the blood of the martyrs as a sort of preservative against the evil spirits; but there is no evidence of such a view in early times. The chemical evidence collected is particularly interesting. C. W. BOASE.

### Intelligence.

Within the course of the present year continuations of some important historical works may be expected. 'G. Waitz, *Deutsche Verfassungsgeschichte*, of which vol. iv., the second portion of the Carolingian period, was published in 1861, whereas a new and very much altered edition of vol. iii., the Merovingian period, appeared in 1870, will reach in vol. v. the times of the Saxon and Franconian emperors, during which both Church and State in Germany had to undergo the most vital changes. Of W. v. Giesebrecht's *Geschichte der Deutschen Kaiserzeit*, we have the first slight instalment of vol. iv., the emperors Lothar III. and Conrad III., and may look out now with certainty for the complement containing the reign of Frederic I. Barbarossa. After the publication of the last six or seven volumes of Pertz's *Monumenta*, and of a number of documentary collections, the constitutional, ecclesiastical, and economical situation of the twelfth century having been discussed minutely in small and large works by the most competent scholars, there is at last hope of having a readable and trustworthy description of this famous epoch, based on the advanced state of methodical study. C. v. Noorden, *Europäische Geschichte im achtzehnten Jahrhundert*, of which the first volume, down to the battle of Blenheim, was received three years ago with due gratification, is expected to finish, if possible, in a second volume, the War of the Succession in Spain. We trust that this sound work may not be interrupted by its author exchanging at Easter his chair of history in the university of Marburg with that at Tübingen.

A third edition of Wattenbach's *Deutschlands Geschichtsquellen im Mittelalter*, a very meritorious work, and quite indispensable for every student of mediæval history, is likewise in course of preparation, innumerable alterations and additions having become necessary since the last edition in 1866. The most favourable sign, however, of the advance and popularity of historical literature in Germany is the circumstance that Ranke's *Sämmtliche Werke*, a complete collection in about forty volumes, started in 1867, and having reached as yet vol. xxiv., require already a second issue of the beginning. Their veteran author, the father of the modern critical school in Germany, and perhaps the most celebrated historian living, though above 75 years old, is still hale and actively at work, as is proved by the first volume of the new and seventh edition of *Deutsche Geschichte im Zeitalter der Reformation*. The reader will easily discover some curious alterations towards the end of the volume, chiefly owing to a publication of the Old Catholic Professor Friedrich, in Munich, on the Diet of Worms in 1521, from the authentic reports of the papal agent Alexander.

*Winckelmann, sein Leben, seine Werke und seine Zeitgenossen*, von C. Justi, the first volume of which was published in 1866, has been lately completed by another volume in two parts. This eminent work, a long deserved monument to the memory of the great man, to whose teaching a century of progress in art owes perhaps more than to any other single person, is just now widely read. Critics more or less seem to combine in the conclusion that, though not a masterpiece in every respect, the book, or better the collection of excellent essays grouped around their common centre, abounds in first-rate research, in deep thought about art in general and all its ramifications, and is on the whole brilliantly written, although rather more in a cosmopolitan than a pure national style. Perhaps the author presupposes too much that everybody, like himself, will be acquainted personally, and by a considerable residence in the country itself, with Italian history, life, manners, and feelings. Justi, who has left Kiel to take the chair of history of art in the university of Bonn, is travelling in Spain just now during the winter months.

Dr. Edmund Pfeiderer, author of a well known work on Leibnitz and his writings, hitherto clergyman in Würtemberg, is appointed

professor of history of philosophy and metaphysics in the university of Kiel.

Among the numerous dissertations published during the by-gone year by young scholars taking their degrees may be noticed: *Kritische Untersuchungen über die Quellen zur Angelsächsischen Geschichte des achten Jahrhunderts, mit besonderer Rücksicht auf die Zeit König Offas*, von Ludwig Theopold, Lemzo, 1872. They are distinguished by researches into the early portions of the Saxon Chronicles, and by an attempt to discover, if possible, some sort of rule in the well-known chronological discrepancies between the annals of the years 754-828. Not only Mr. Earle and Mr. Stubbs—whose books are not overlooked—but even beginners in early English history, may be interested to see how these matters are handled at present by the rising generation of German historians.

Mr. Edward A. Freeman and Professor W. Stubbs have been elected corresponding members of the "Societät der Wissenschaften in Göttingen," in honour of their eminent labours in early English and mediæval history in general.

A book of considerable interest to English people is in the press in Germany: *The Correspondence of Frederick William IV. with Bunsen*. The Emperor of Germany has agreed, after much consideration, to allow these letters to see the light, and the selection and editing of them have been committed to von Ranke, who has also written a preface. The book will contain many curious and important disclosures respecting political and ecclesiastical events.

The bibliographical catalogues, issued by the firm of Vandenhoeck and Ruprecht at Göttingen, and superintended by Dr. Müldener, one of the librarians of the great University Library, are already favourably known abroad, in England, Holland, Scandinavia, Russia, and America. However, it may be useful to state that they continue to be published periodically—generally every six months—as systematic surveys in the chief branches of literature, both German and foreign, and not merely for the use of the trade and libraries. Their arrangement is exceedingly convenient for book collectors and scholars, viz.: a. *Bibliotheca geographica*; b. *B. historica* (history, biography, and politics); c. *B. historico-naturalis, physico-chemica et mathematica*; d. *B. mechanico-technologica*; e. *B. medico-chirurgica, pharmaceutico-chemica et veterinaria*; f. *B. philologica* (ancient and modern languages and archaeology); g. *B. theologica* (Protestant). A series of these catalogues serves as a most curious index of the movement in the different branches of science and literature.

We are sorry to hear of the death, from consumption, of Professor Kachenofsky, of the university of Kharkof, the well-known writer on political economy and international law. He died at Kharkof, on the 2nd of January.

MM. Didot, of Paris, are about to bring out a new edition of Joinville, by M. de Wailly.

### Philology.

*Herculaneum Voluminum Collectio Altera.* Tom. VII. Fasc. 3. Naples: Detken.

THIS new fascicle of the *Herculaneum Rolls* has just been published. It contains *Ignoti librum, cujus titulus haud superfluit*. The lacerated pages treat of Poetry, and thus form part of a group of writings the classing of which is a task far from easy, owing especially to the strange polemical relations subsisting among writings otherwise nearly related to each other.\* But for once we may safely dispense with

\* Cf. e. g. vii. 207: with iv. 274:

favourable reception to this first volume of the *Ecclesiastical Chronicle*, and will ardently wish to have the whole of it soon in their hands.

When we recollect the number of scholars who have had the intention of publishing this work, or who have recoiled before the enterprise, we can understand that the enterprise of MM. Abbeloos and Lamy has been environed with considerable difficulties. They have had to copy the texts and to translate them, two long and laborious operations, particularly the second; for, although the style of Bar-Hebraeus is generally pure, limpid, and worthy in all points of the second golden age of Syrian literature, it yet contains many expressions borrowed from foreign languages, of which it is not always easy to catch the sense. Add to this, that the Syriac lexicons at our disposal are extremely imperfect, and we shall be a little more indulgent towards the mistakes which have escaped the attention of the editors of Bar-Hebraeus.

The first volume of the *Chronicle* contains 456 columns of text or translation, and presents the ecclesiastical history of the orthodox and Monophysite Syrians almost down to the eleventh century. Following the custom of the ancient chroniclers, Bar-Hebraeus goes back to the beginning of all things; he introduces the history of the patriarchs of Antioch by that of the pontiffs of the Old Testament. This passage, which is sufficiently short (cols. 1 to 32) seems to supply the place of a preface. Next comes the history of the apostles and the orthodox or Jacobite patriarchs down to the year 1399 of the Greeks or 1088 of Jesus Christ.

The Syriac text is in general sufficiently correct. There are, no doubt, a few errors; but how could they be avoided in a long printed work when the character employed is imperfect, and the compositors are but little accustomed to Oriental type? Here are a few of the more important ones—not that they are of any great moment. Page 45, line 9, *R'doufo* for *R'douf'io*; *ibid.* 14, *Pehtso* for *Pets'ho*; 61, 14, *th'raheim* for *th'raihoun*; 105, 11, *coursotk'houn* for *coursavoth'houn*; 131, 9, *schok* for *sok*; 565, 23, *noth'rai* for *no'r'ai*; 193, 12, we should probably read *oh'do* instead of *hoido*, see note on 2nd col. 2nd last line; 199, 6, *lan* for *men*; 207, 5, *i'en* for *ia'in*; 213, 6, *tal'io* for *thal'io*, see line 11; 215, 11, *m'rahiin* for *m'ra'cin*. We would also point out to the learned editors a few passages which call for revision: 49, 7, 20; 63, 19; 87, 3; 105, 15; 113, 3; 115, 2; 117, 3, 9, 21; 119, 9, 22; 129, 6; 133, 22; 135, 2; 145, 8; 159, 14; 165, 27; 167, 18; 185, 16; 197, 2; 209, 5; 219, 11; 221, 6; 223, 10, see note 2 and page 225; 225, 16; 227, 6, 20; 233, 3; 235, 12, 16, 23; 237, 6, 12; 241, 20; 243, 5; 247, 10, 20; 253, 21; 263, 8; 275, 11; 277, 18; 279, 7; 297, 23; 331, 12; 335, 11; 337, 17; 351, 12; 361, 15; 387, 4; 421, 1, 5; 429, 16.

The works of Bruns and Kirsch, the learned remarks of Bernstein and several other scholars, have shown that the translation of the chronicle of Bar-Hebraeus was an arduous work, even for the part in which we have long possessed the Arabic text. How much more difficult must it be when we have nothing but the Syriac text to guide us. The editors themselves admit that some errors have escaped their attention (p. xxx), and they propose later to indicate all the corrections they have found necessary. We shall see faults like the following removed: Page 122, line 10, *sedem* ('oumro) *Bar-chatib* for *Omar-bar-chatib*; 150–152, *nec quod aegrè erga illum dispositus sim, aliis complacere quaero, for illum vitupero*; 172, 15, *jugulate* for (manu) *percutite*; 184, 24, *tractatus* de festis for *carmina in festa sancta*; 206, 7, *sua eum modestia morigerum reddebat*: this refers, in our opinion, to the emperor, and should be rendered: *sed (imperator) viri sanctimoniam veritus in eum injicere manus ausus non est*; 350, 9, *nolim tamen domestica mea deprimere,*

instead of *ne nimis mea aestimare videar*; 384, 23, *neesse non habeo gravare intelligentiam tuam*, instead of *neesse non habeo depingere intelligentiae tuae*; see also 373, 9; 405, 9; 405, 23; 417, 20; 445, 20. Instead of *pacem illi acceleravit*, p. 409, 33, we should prefer to render *illum cito abstulit*.

But these are only trifles, which do not seriously impair the value of the work. The editors have performed a real service, not only to Orientalists, but to cultivated readers in general, who will highly appreciate the translation of the *Chronicle*, and the historical, bibliographical, and geographical notes by which it is adorned.

L'ABBÉ MARTIN.

*De Astrologiae Indicae "Horā" appellatae Originibus.* Accedunt *Laghu-Jātaki Capita inedita III-XII.* Dissertatio philologica; scr. Hermannus Jacobi. Bonn: 1872.

THE subject-matter of Dr. Jacobi's dissertation belongs to a kind of literature that, for obvious reasons, is little inviting for most Sanskrit philologists. Yet the results obtained by scholars like Colebrooke and Weber are well apt to show to what useful ends the study of Indian astrology may be made subservient. It is to the study of that system of perverted ingenuity that we are indebted for the first and strongest direct proofs of the influence of Hellenism on Indian science and quasi-science. And besides, astrological observations enter so largely into the habits of Indian life, past and present, that a knowledge of the general features at least of the system may be safely recommended to every Sanskritist. It would be an unreasonable demand, however, that all should devote their time to so dull a task, and if there only be a few willing to make a more special study of the astrological branch of literature and communicate the results of their labours, that is all that can be required.

Both by his translation and his introduction Dr. Jacobi has proved how fully he acknowledges the relative importance of Indian astrology, especially in its connection with its Greek counterpart. His translation is generally faithful, being based upon the excellent commentary of Utpala, without whose care and industry Varāha-Mihira would, it is most likely, have been utterly forgotten. A still higher praise should be awarded to the interesting introductory chapter in which Dr. Jacobi exhibits a more extensive knowledge of the Greek sources, Firmicus Maternus, Manetho, &c., than, perhaps, any of his predecessors in that walk of literature. As it would be out of place in a short notice to give a more detailed exposition of the contents, we will limit our remarks to a few points.

The question treated of by Dr. Jacobi in his introduction, p. 13, *seq.*, as to the period of the *Gārgi-Sanhitā*, is far from being so easily solved as he seems to think. To avoid any misunderstanding, Dr. Jacobi would have done well to use the term "author of the *Garga-Sankitā*," instead of simply "Garga," for even those who believe in the existence of some man living in no period, and possessed of the felicitous name of Grumbler (*i. e.* Garga), will acknowledge that his authorship is as fictitious as the Sun's and Brahman's.

The question then is whether the book ascribed to Garga dates from about 300 A.D., as Dr. Jacobi opines. It is by no means impossible; but as Varāha-Mihira flourished 550 A.D., and Kālidāsa about the same time, or even earlier, according to Dr. Jacobi himself (see his *Sententiae*, at the end), we ought at the same time to conclude that in the interval between 300 and 500 A.D. changes in language, style, taste, and habits of thought must have gone on at an unusually swift pace. For the difference between Garga and Kālidāsa, Āryabhaṭa and contemporaries, is very great. However that may be, it is dangerous to pronounce or even to dispute about the matter before we have a complete and

readable text of the *Gārgī-Saṁhitā*, were it only to make out whether the whole be from one hand and of the same time, or not.

Among the many good remarks occurring in the dissertation, we point out the most happy rectification of the generally adopted opinion (originally Weber's, if we are not mistaken), that Sanskrit *kemadruma* answers to χρηματισμός. Dr. Jacobi proves that not this Greek word, but κενόδομος, is the term to which the origin of *kemadruma* is to be traced. By the way may be remarked that in the verses quoted from Utpala the reading *arthagamo* is not right; *arthāgamo*, "acquisition of wealth," is meant. As to *arthakshapa*, two lines before, that is no word at all; the word is *arthakshaya*, "decrease of riches," "loss of wealth."

The word *vibudha* (p. 46, l. 22) is wrong, undoubtedly, as the editor has pointed out, but the emendation *budha* will not do, because the latter never occurs, so far as we know, in the sense of "a god," and yet it appears from the parallel passage in the *Brhaj-jātaka* that only a word denoting the same idea can have been intended. A restitution based on palaeological grounds or the similarity of letters will in this case be tried in vain. Therefore we may hold that the error has sprung from another cause, viz. the fact that the passage in the *Brhaj-jātaka* exhibits *vibudha*, which has been substituted for the required dissyllable, of the same purport, in the *Laghu-jātaka*. That dissyllable is *sura*, "a god."

We cannot end this brief notice without giving utterance to our hopes that Sanskrit philology will be benefited by more works from the author, whose first publication is of small compass, but, to use an astrological phrase, augurs so well for the future.

H. KERN.

### Intelligence.

The *Daily Telegraph* of January 9 publishes a correspondence between Mr. Edwin Arnold, on behalf of the proprietors of that newspaper, and Mr. Winter Jones, Librarian of the British Museum. The proprietors offer the sum of 1000 guineas to cover the expenses of a fresh expedition to Mosul, under the conduct of Mr. George Smith, on the understanding that the researches be concluded within the space of six months. This very liberal offer has been accepted by the Trustees of the Museum, with the sanction of the Lords of the Treasury, who have allowed Mr. Smith six months' leave of absence from his official duties at the British Museum. Such relics of Assyrian antiquity as may be thought worthy of transport to England are to be presented to the British Museum; and Mr. Smith has agreed to furnish the *Telegraph* with full reports of his proceedings while engaged in the expedition. It is probably the first time that a purely scientific object has been thus subsidised. Our best hopes will accompany the expedition, which appeals even to a wider circle than the deservedly popular "Palestine Exploration Fund." One little thing only is wanted to crown the generosity of the *Daily Telegraph*: a complete abstention from pretentious and sensational writing on the dangerous subject of Assyrian antiquities.

In all directions we notice a growing sympathy on the part of Semitic scholars with the labours of cuneiform interpreters. Dr. Kuenen devotes seven pages of the new number of the *Theologisch Tijdschrift* to the recent work of E. Schrader, already reviewed in the *Academy*. He professes to have been already converted by the careful and methodical examination of the basis of the decipherment by the same writer in the German Oriental *Zeitschrift* for 1870. But he hardly does justice to the merits of M. Oppert, who had already in his most valuable *Expédition en Mésopotamie* offered explanations of particular phenomena for which Dr. Kuenen refers to other scholars, viz. the identification of Abel (Hebel) and the Assyrian *habal* (son), and the elucidation of Assyrian monograms.—A writer, who signs himself J. G., in *Grätz's Zeitschrift* for December, gives a thoughtful notice of Sayce's *Assyrian Grammar* (also reviewed in the *Academy*). When, however, he represents the author as deriving certain grammatical forms from a foreign source, he forgets the passage on page 2 of the *Grammar*, in which the author expressly guards himself against such an imputation.

Assyrian students will be interested in the following note from *Trübner's Record*:—"Mr. E. Thomas, the well-known Oriental palæographer and numismatist, has published in his *Early Sassanian Inscriptions, Seals, and Coins* (p. 8), impressions of seven seals from the

record chamber of Sanherib, the Assyrian king. Six of them bear evidently characters which resemble very much the Himyaritic and Ethiopian writing, which similarity has been already observed by Mr. Thomas himself, who calls them Ethiopian seals. At the last meeting of the Royal Bavarian Academy of Sciences, Professor Haug made these seals the subject of a paper, in which he showed that Nos. 2, 3, and 4 contain the same name, which can only be read (from left to right) *Shamsh*. This name he then identified with *Samii*, who is several times mentioned in the Assyrian inscriptions (in those of Tiglath-pileser IV. and of Sargon), and expressly called *sarrat mat Aribi*, i. e. Queen of the Arabs. The characters on the seal are evidently those which were current in ante-Christian times all over Arabia, since inscriptions in them have recently been found in the ancient Moabite country, and some time ago at Warka, in South Chaldaea. The paper will shortly appear.—S."

An anonymous writer makes this statement in the *Phoenix*:—"It is said that over 100 students are now employed at Yedo, in codifying and simplifying the Japanese characters, with a view of adapting them to the representation of sounds used in foreign languages. A scheme to supply the Japanese with a phonetic alphabet, capable of representing every one of the ninety-two consonantal and vowel sounds, as well as their native sounds, will shortly be submitted by the writer, the characters being founded on the outlines of the present *I-ro-ha*."

*Trübner's Record* for January 1 contains a translation of "A Buddhist Jātaka from the Chinese," from the 14th kiouen of the *Mahā Par Nirvāṇa Sūtra*, by the Rev. S. Beal.

Rabbi Isaac Weiss, editor of the *Mekilta*, and author of a book on the idiom of the *Mishna*, has brought out the first volume of a history of the Rabbinical literature, under the title, *Zur Geschichte der jüdischen Tradition*. Unfortunately, as it is written in Hebrew, it will only be accessible to Rabbinical scholars. M. Weiss is one of the best Talmudic scholars, and, though orthodox, does not shrink from modern criticism. He has even introduced a chapter on the doctrines of the New Testament with reference to the Jewish tradition. We expect impatiently the second part, which will treat of the Talmudic period, for which there are more Rabbinical authorities than for that between the first and second temples.

The first part of Mätzner's *Old English Dictionary* (in continuation of his *Altenglische Sprachproben*) has appeared. It extends only to "at." Judging from this specimen, the work is a considerable advance on Stratmann's. The thorough treatment of the particles, especially, augurs well for the general soundness of the whole.

M. Littré has completed the last volume of his classical French Dictionary.

### Contents of the Journals.

*Journal of the North China Branch of the Royal Asiatic Society*. New Series, No. VI. Shanghai, 1871.—1. Notes on the Shantung Province, being a Journey from Chefoo to Tsiuhsien, the City of Mencius; by J. Markham. [The party started from Yentai (Chefoo) on February 24, 1869. Their route lay through the Tsyhja district, and the cities Laeyang, Tsimi, Kyachow, Kaumi, Weihsien, Tsingchow-foo, Chechuen, Tsinan-foo, Taengan-foo, whence they ascended the Taeshan range studded with Taoist temples. They then proceeded to Kiufow, the city of Confucius, of which an interesting account is given, as is also of Tsiuhsien, the city of Mencius, which they visited next. The paper also contains detailed accounts of the nature of the ground and the products of the districts traversed.]—2. On Wen-chang, the God of Literature, his History and Worship; by W. F. Mayers. [This is one of the canonical divinities to whom worship is officially addressed throughout the empire of China by imperial ordinance. Twice in each year sacrifices are offered before his altar in every city; and the temples erected in his honour vie with those of Kwan-Ti, the God of War, in popular respect. He is represented either under the form of a dignified and venerable sage, or of a wild unearthly figure; and is connected with the constellation of *Ursa Major*.]—3. The Fabulous Source of the Hoang-ho; by E. J. Eitel. [By Chinese Buddhists the source of this river is connected with the Anavatapta (or Manasarovara) lake, on the northern slope of the Himalaya, whence four rivers are said to issue, viz. the Gangā, Sindhu (Indus), Vakohu (Oxus), and Sitā. The last-named river is said to disappear in the earth, and, after passing through a subterranean channel, to reappear again on the Ashmakūta mountains as the source of the Chinese river Hoang-ho, and flow into the eastern ocean.]—4. Sur les Institutions de Crédit en Chine; par M. G. E. Simon.—5. On the Introduction and Use of Gunpowder and Fire-arms among the Chinese; with notes on some ancient engines of warfare, and illustrations; by W. F. Mayers. [Contests the opinion prevalent as to the discovery of gunpowder by the Chinese, and advocates the claim of India as the birthplace of the invention of explosive compounds.]—6. The Chinese Game of Chess as compared with that practised by Western Nations; by K. Himly. [Shows the close connection of the Chinese game with the Indian and

Persian. The writer demurs to Bland's theory on the Persian origin of the game, and inclines to consider either India or Cambodia as its birthplace.]—7. Note on the Chihkiang Miautz'; by D. J. Macgowan. [The Miautz' or hill-tribes (lit. sons of the soil, or aborigines) are divided by the Chinese into two classes, the civilized, or *shuh*; and the wild, or *sang*. Their daughters are never given in marriage beyond their pale, but girls are sometimes taken from without for wives. They dissent from the prevailing creeds, Confucianism and Buddhism, being worshippers of spirits or demons, and having neither temples nor images. From passages in Chinese historians it appears that during the reign of the last emperor of the Yuen dynasty (about 1333 A.D.) the Miautz' were numerous and formidable in the departments of Chichau and Funghwa.]—8. Notes on the Provincial Examination of Chekeang of 1870, with a version of one of the Essays; by G. E. Moule. [The provisional examination for the second literary degree at Hanchow. 11,000 candidates are said to have entered the examination-yard, of which 112 obtained the degree and 18 were honourably mentioned.]—9. Chinese Chemical Manufactures; by F. Porter Smith.—10. Journal of a Mission to Lewchew in 1801; by S. W. Williams. [The journal of Li Ting-yuen, a member of an imperial commission despatched from Peking to Shudi, in which he narrates his observations in a lively style, and furnishes a fair idea of the civilisation of the people, with notices of their government, customs, and products.]—11. Translation of the Inscription upon a stone tablet commemorating the repairs upon the Cheng Hwang Miao, or Temple of the Tutelary Deity of the City; by D. B. McCartee. [Composed and written by Chên Sie, surnamed Pan-kiau, renowned as a calligraphist, scholar, and wit, about A.D. 1150.]—12. Retrospect of Events in China and Japan during the years 1869 and 1870; by J. M. Canny.

*Zeitschrift für Deutsche Philologie*, IV. 3.—W. Braune: Untersuchungen über Heinrich von Veldeke. [Proves, chiefly from the rhymes, that Veldeke wrote not in High German, as has been hitherto assumed, but in his native dialect of Maestricht.]—Rückert: Zur Charakteristik der deutschen Mundarten in Schlesien. II. [States as the most general and characteristic feature of these dialects the weakness of their accentuation.]—Kern's *Glossen in der Lex Salica*; reviewed by R. Thiele. [Contains very valuable and original matter very inconveniently arranged. Thiele gives a summary of the phonetics and inflexions of the Frankish language, based on the results of Kern's investigations.]

### New Publications.

ABEL, C. Ueber den Begriff der Liebe in einigen alten u. neuen Sprachen. Berlin: Lüderitz.

ARDA VIRAF, The Book of. The Pahlavi Text prepared by Dastur Hoshangji Jamsapji Asa; revised and collated with further MSS., with English translation and introduction, and appendix containing the texts and translations of the Gosht-i Fryāno and Hadokht Nask, by M. Haug, Ph.D., assisted by E. W. West, Ph.D. Published by order of the Government of Bombay. Trübner.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. IV.—No. 64.

*Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance. The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.*

*The Editor cannot reply to questions from authors respecting the notice of their books.*

*The next number will be published on Saturday, February 1, and Advertisements should be sent in by January 29.*

## UNIVERSITY OF LONDON.

### The Office of Assistant-Registrar

having become vacant by the Resignation of DR. HIRST, the Senate are about to appoint a successor, who will also be charged with the duties of Librarian. The salary of the Assistant-Registrar and Librarian will be £500 a year. In common with the other Officers of the University, he will be subject to annual re-election. His whole time must be devoted to the business of the University. He will be required to enter on his duties not later than May 1st. Further information may be obtained by application to the Registrar.

Candidates are desired to send in their names to the Registrar, with a statement of their age (which must not be less than 25, or exceed 45 years), previous career, and qualifications, and with such Testimonials as they may think desirable, on or before Saturday, February 15.

It is particularly requested by the Senate that no personal application be made to its Members individually.

University of London, W.  
January 7, 1873.

### THÉOPHILE GAUTIER.

IF *Les Jeunes France* had gone to Sir Piercie Shafton for their vocabulary (and they often went further and fared worse), they might have called *Théophile Gautier* "our Resipiscence," though he was the author of *Mademoiselle de Maupin*, which has fair claims to be regarded as the most audacious book of a singularly audacious movement. "Our Good-nature" would perhaps have been a more appropriate, certainly a more obvious, sobriquet, and it would have at bottom included the other. He had a very rich and wholesome nature, which he was not long in discovering was really enough to live upon, and as he grew older, he returned to it with increasing satisfaction. It must be added that the circumstances under which his talent first produced itself were of a kind to give full play to his irreverence and a frankness so unscrupulous as to approach to cynicism, and that the excess of every kind of stimulus which surrounded him had brought on a crisis of over-excitement morbid in proportion to the intense vitality and robust constitution of the patient.

The works of this "period of storms and stress," published during the early years of the revolution of July, are morbid whenever they are serious; *Albertus* (the subject of which was repeated with an immense gain in clearness and suavity in a prose *nouvelle*, *La Mort amoureuse*) is perhaps the best of them, and it shows clearly how unlikely the author was to remain in the repose of nightmares; into which he had only strayed because the craving for the *outré* finds its most obvious satisfaction among horrors. The poem is lurid and voluptuous enough, but all the while the poet is laughing at his own pretensions, and at the method of his school, and when he takes leave of the book with a call for a bottle of burgundy and a volume of Rabelais, we feel no doubt of his speedy recovery; it is simply a want of convictions, strong enough to control and direct the tumult of his desires to some object too distant to be disappointing, which made him hanker after the images of the charnel-house and the Thebaid. All the poems of this period are musical and eloquent, but they are too incoherent, too much the expression of a discontent that founds itself on temporary circumstances to be exactly fitted for immortality, and though the

latest of them, the *Comedy of Death*, has a comparatively developed structure, this only serves to bring out more clearly the poverty of positive thought which underlies its imaginative splendours.

On the whole we are inclined to think that he really did himself less injustice in the outrageous humour of his comic works, though the riotous realism is often carried not only beyond the limits of conventional propriety but of aesthetic decorum. One cannot help laughing at the young men who meet to enact one of the orgies described by Sue, Dumas, and Hugo, when they provide mattresses on which to throw their mistresses out of window, and take off their shoes to trample on them, but one hardly feels that to the great public, which never had the misfortune of living with them, these heroes are really worth powder and shot. His later grotesque, *Une Larme du Diable*, is a good deal more ambitious and upon the whole less satisfactory; such merit as it has is to be found in its absolute *naïveté*, in the frank credulity of the whole thing; it is very profane and not very amusing, but one feels that the author is really trying by such light as he has to fancy what God and His saints talk about in Paradise; it is a favourable specimen of one of Plato's three classes of lies, those which are invented to take the place of an unknown truth.

Certainly there is no reason for ascribing his profanity to anything like intentional disrespect: in one of his later works, the *Roman de la Momie*, published in 1863, he goes out of his way to patronise the plagues of Egypt, and even to rehabilitate the horns of Moses. He was a pagan rather than a rationalist, and when, as he grew older, he opened his eyes under the influence of Baudelaire to the element of petulance there is in neo-paganism, his hearty dislike to the humanitarian jargon by which the Romanticists, from Victor Hugo downwards, tried to compensate the absence of both historical knowledge and coherent artistic aims, took more and more the character of a determined dislike to every possible theory of every kind of progress. The strongest of his personal convictions was expressed by the Oriental proverb quoted by Fortunio, that it is "better to be standing than walking, better to be sitting than standing, better to be sleeping than waking, and better to be dead than sleeping." Such a temper, of course, must deprive the greater part of the ordinary motives of literature of nearly all their interest; nothing remains but to excite the desires by elaborate descriptions

of their objects. The writer confesses again and again that it is a burden to him to have to invent even the semblance of a story to link together the few overwrought *tableaux*, of which two or three are passionate and most are simply sensuous. Throughout we are reminded that we are dealing with an author who had wished to be a painter, and we are not reminded in the pleasantest way. We feel that words are being made to do the work of forms and colours, and that in such work words have only one advantage, which a temperate public might think questionable. When the voluptuous impression has to be built up slowly, touch by touch, as one detail is described after another, a reader who wishes to gloat upon such impressions feels that for him the wish of the Greek glutton is realised, and that he is almost as well off as if he had as long a throat as a crane. And though, even with this drawback, the book has glow and splendour enough to be intoxicating, it leaves more than one unpleasant aftertaste. When Fortunio prides himself upon a collection of gigantic panoramas and dissolving views to supply a background at his choice to the scarcely less theatrical gorgeously of his seraglio in the midst of Paris, it is surprising that an author who makes so many returns upon himself should not have stopped to sneer at the inevitable imperfection of an artificial paradise, even when fitted up regardless of expense. It gives quite a new meaning to the primaevial curse, "Dust thou art, and unto dust thou shalt return," when we see that the last outcome of cultivated luxury is to immerse life again in the inorganic splendour from which it was evolved.

It was not an accident that Gautier occupied himself more and more as time went on with *feuilletons*; it may seem a harsh thing to say, and yet we doubt if he would have resented it, the *fêtes* of the Tuileries were after all his realised ideal, so far as it could be realised. No doubt they left something to be desired, no doubt he and the public for whom he described them had to make believe a good deal; but then descriptions of a luxury which never existed, even at the Tuileries or St. Cloud, are rather like a Barmecide's feast, and require the guests to make believe a good deal more. At first sight it may appear curious that the will should be the one element of ordinary human nature which such a writer was never weary of exaggerating; but the will which Gautier idealises is not the will which makes efforts, which conquers difficulties, which carries out plans adapted to circumstances. It is a kind of counterfeit omnipotence, an imperious resolve which excludes the idea of resistance, which is sated with success, and is only roused to desire by the appearance of a difficulty too familiar to be endured, and then must wait in helpless arrogance to be served by opportunity or broken by destiny. It is only in a single work, which, with all its vigour and liveliness, is hardly characteristic (*Le Capitaine Fracasse*), that any ethical effect is produced in the process; and the *Duc de Vallombreuse* is after all a rather pale imitation of "Edyrn, son of Nudd," and the whole story is a picturesque medley of somewhat incongruous elements of which few are original. Chiquita is really a *picaresque* version of *Mignon* and *Fenella*. Sigognac himself is a very superior walking gentleman, a sort of cross between the Master of Ravenswood and Quintin Durward; Augustin and his scarecrow brigands, Lam-pourde and his society of chivalrous cutthroats, are fresher, but the latter at any rate belong rather to the nineteenth century than to the seventeenth; they are simply Romantics of a somewhat extreme type transported back into their golden age, the age before the *Grand Siècle*.

He did not succeed better in *La Belle Jenny*; the story is really on the level of G. P. R. James, and the device of a secret society for correcting the decrees of Providence is

hardly worth the mystery which is ingeniously maintained up to the point when the disclosure would produce most effect, if only there were anything to disclose. The book is put together with the cleverness of a practised workman, but the real value is in the isolated scenes. Gautier only found his full originality and power when he was far away from the novel of action and confined himself to a chronicle of moods and desires. His greatest work is *Mademoiselle de Maupin*, and his most perfect is *Spirite*. Perhaps the fact that his greatest work was produced so early, when he was still under five-and-twenty, may be taken for a sign that he had entered upon a direction in which real progress was almost impossible; considering the perfection of his latest work, it certainly cannot be taken for a proof that he had frittered his powers away. Both turn to a great extent upon the same subject, the perplexities of a hero who does not know whom to love, and yet is in love or half in love with loving. In *Mademoiselle de Maupin*, the beloved meets him halfway to find out what men are like who say they love, and parts when she has found the secret; in *Spirite*, the beloved will not seek, and a series of small fatalities hinders her being sought, and so she has to wait for death until she is free to reveal herself. In both the conception is better than the execution. *Spirite*, with all its beauty, is undeniably thin and pale, and the ideal background is a rather unfortunate and wholly incredible mixture of Catholicism and "spiritualism." *Mademoiselle de Maupin* is almost as much overloaded with discussion as *Wilhelm Meister*; the story stands still while the hero is expounding his objections to Christianity, which may be summed up in a preference of the Venus of Milo to the Crucifix, and while the characters are discussing how *As You Like It* ought to be acted; not to mention such superficial blemishes as the way in which the story varies from letters to narrative and back again. No one can be surprised that the book created a scandal, and yet it might be difficult to assign a reason why it is so much more objectionable than others. Perhaps the nearest approach to give an explanation would be to say that, without being remarkably wicked, it is more than remarkably shameless; morality cannot exist without some kind of conventional decorum, and in *Mademoiselle de Maupin* there is no decorum whatever; apparently because the writer did not understand the meaning of the word. In general his attitude to morality is rather friendly than otherwise; it rather resembles the feeling of a savage who has been impressed by a missionary and is inclined to dilute his teaching for the benefit of still heathen friends. The result of works like *La Toison d'Or* and *Jean et Jeannette*, and even *Celle-ci et Celle-là*, is that, as morality does not exist (having been abolished in the necessary and beneficent reaction against *classiques* and *épiciers*), it would be well to invent a little, especially as a little will go a long way. During his life he was best known by his critical and descriptive works. Their merits are sufficiently obvious. He had a splendid, copious, and precise vocabulary; his attention was always at leisure and never asleep: perhaps both these qualifications may be traced to an intense and unoccupied vitality. In all his works he describes too much, simply because it is easier to attend to still life than to invent incident; not like Balzac, because he attaches himself with the whole force of his genius to every corner of his subject. The same keen and indiscriminate curiosity makes his travels more valuable than his criticism. It is said that he praised for very indolence, because it was less trouble than to invent reasons for a qualified judgment; but the fact is that he cared more for new and vivid sensations than for positive beauty: he gives his measure as a critic by the opening paragraph of *Les Grotesques*, where he lays down as an aphorism that for-

gotten writers are more interesting than classics because there is nothing to find in the latter except what everybody admires because it is the reflection of himself.

Of course there can be no comparison between the intellectual stature of the two men, but perhaps the best way to give an idea of Gautier as a whole would be to call him an irrational Goethe. Both found rest from the turmoil of passion and desire in the clearness and repose of art, but while Goethe worked out his deliverance through a lofty philanthropy and an elaborate scientific culture, Gautier owed his escape to nothing higher than common sense, aided by a wholesome joyous temperament always open to the sweet impressions of external nature. It is the highest praise of the author of *Émaux et Camées* to have preserved and improved his magnificent faculties in the entire absence of any worthy object, to have secreted such pellucid amber to immortalise such quaint and pretty flies.

G. A. SIMCOX.

Shakespeare's Southampton-Sonette. [Deutsch von Fritz Krauss.]  
Leipzig: 1872.

THE most characteristic feature of this contribution to Shakespearian literature is that the translator unreservedly adopts Gerald Massey's clever theory of the subject of the sonnets, and with a truly German recklessness treats the ingenious hypotheses of that romance as though they were established facts of history. Thus the very title of the book contains an unwarranted assumption, while the sonnets themselves are arranged in a new order, and headed with such titles as the following:—

- "Elizabeth upbraids Southampton with Infidelity";
- "Elizabeth to her Presumed Rival, Lady Rich";
- "Elizabeth preaches Morality to Southampton";
- "Southampton to Elizabeth after his Return";
- "The Poet to Southampton after a Long Silence."

Massey's theory may be briefly stated thus: Shakespeare, feeling a loyal admiration for his young patron, Lord Southampton, recommends him matrimony as a preservative against the dangers of London and court life. Southampton fixes his affection on Elizabeth Vernon: Shakespeare encourages this feeling, and acts as a literary go-between, writing sonnets to the lady in the person of the gentleman, and to the gentleman in the person of the lady. To make this theory fit the sonnets, we have to suppose that in courting Elizabeth Vernon for Southampton, Shakespeare, "from motives of delicacy," concealed her sex and addressed her as a man. "No favouring star smiles on the lovers," to use the phrase of Herr Krauss: the queen tries to prevent Southampton's marriage, and he leaves England for a time; Elizabeth Vernon suspects that Lady Rich is her rival; meanwhile Shakespeare, in a series of sonnets, expresses the despair of the lover and the jealousy of the lady. At last a secret marriage is accomplished; and Shakespeare, breaking the Prospero's wand of poetry which he had wielded in this commonplace amour, has nothing left to do but to write sublimely about the prospect of his own death. This novel is founded partly on the fact that the publisher of the sonnets dedicated them to a Mr. W. H., and that Lord Southampton's names were Henry Wriothesley; and partly on the passionate desire of modern critics to escape from the simple conclusion that the sonnets express Shakespeare's personal feeling for some unknown individual. In their endeavour to get the poet out of one mess they have got him into another. The position now assigned to him is not wholly unlike that of

Martha in Goethe's *Faust*; except that it becomes almost ludicrous when we assume that Shakespeare employed his genius in the composition of poems on both sides of the amorous debate. While regarding the problem of the sonnets of Shakespeare as involved in the greatest difficulty, I incline to what Herr Krauss describes as "die persönliche Theorie." The arguments which are brought against the possibility of such tender effusions having been addressed to a man, would seem to reveal a want of psychological sympathy and information, as well as unfamiliarity with much modern European literature, as, for example, with Tasso's sonnets to Vincenzo Gonzaga and Michel Angelo's to Tommaso Cavalieri. If any "dramatic theory" must be adopted in order to relieve Shakespeare from the severe condemnation passed on him by Hallam, I should prefer the very subtle hypothesis supported by Simpson, who regards the whole series as a lyrical framework for the expression of successive moods of feeling culminating in a highly wrought Platonic passion. At all events this theory attains its object without the inversion of a bulky pyramid of suppositions upon the single point of the two letters W. H. like that which Gerald Massey has constructed and Herr Krauss has accepted as though it were a portion of the solid substratum of actual fact in history. I am far from denying the ingenuity and learning displayed by Gerald Massey, nor do I hesitate to admit that his romance is more interesting than that of Mr. Armitage Brown or of François Victor Hugo in his French translation. The question for consideration really is whether we are at all justified in assuming as much as Massey's view implies, when we know how easy it is in all matters of emotional utterance to square the expression of the poet with our own pre-established prejudices, and when we are forced to do such violence to the poems themselves as to suppose that many which are obviously addressed to a man were intended for a woman. The old theory of Chalmers, that Shakespeare's sonnets were all written as a compliment to Queen Elizabeth, is scarcely more absurd than Massey's, in relation to many of the verses which Shakespeare is supposed to have written to Miss Vernon for Southampton.

Having said so much by way of protest against the substitution of theories for facts which diminishes half the interest of this translation, it remains to test the literary qualities of the work itself. The ideal to which the translator aspires is a high one. Not only does he preserve the exact structure of the rhymes, but he also tries to reproduce the alliteration, antitheses, and pauses of his original. The result is that on the whole the movement of his version is good. Our ear, in reading it, is satisfied with true Shakespearian cadences, which are in many cases, as, for instance, in Sonnets 30, 60, 90, 109 (pp. 102, 83, 149, 160), well sustained. Where the point of the English turns upon some prolonged conceit (as in Sonnet 87), the effect is not so perfect; nor does Herr Krauss seem sufficiently alive to the necessity of preserving antitheses at any price in the sonnets which, like No. 16, owe all their value to a succession of epigrams. Occasionally his prejudice in favour of Gerald Massey's theory causes him to do violence to Shakespeare's meaning. Thus, for the first quatrain of Sonnet 40:

"Take all my loves, my love, yea, take them all:  
What hast thou then more than thou hadst before?  
No love, my love, that thou mayst true love call;  
All mine was thine before thou hadst this more"—

we get:—

"Nimm alles, was ich liebe, und bekenne,  
Ob Du nun mehr hast, als Du schon bekamst?  
Nicht Liebe, Lieb! die man die wahre nenne:  
Du hattest meine, eh' Du dieses nahmst."

Here Herr Krauss, imagining that Elizabeth Vernon is addressing her rival, Lady Rich, has omitted to translate the emphatic words, "my love," in the first line. In Sonnet 42, starting with the notion that Elizabeth Vernon is writing to Southampton about her rival, the translator makes her allude to Southampton as her "friend"; and to Lady Rich as her "love." Our sympathies are strangely perplexed by the peculiar relation in which the three persons are supposed to stand to each other. Again, in Sonnet 133, the phrase, "I being pent in thee," which is appropriate in the mouth of a man speaking to his mistress, has to be turned into "Ich in Deinen Banden," in order to adapt it to a lady addressing her rival.

Although the general excellence of the translation is considerable, the admirer of Shakespeare's peculiar style in the sonnets will be disappointed when he compares some of his chief favourites with the German. For example, the first quatrain of Sonnet 106:

"When in the chronicle of wasted time  
I see descriptions of the fairest wights,  
And beauty making beautiful old rhyme,  
In praise of ladies dead and lovely knights;"

is rendered thus:—

"Wenn in verschwundner Zeit Erinnerungen  
Die Anmuth ich beschrieben seh' und lern',  
Wie Schönheit alten Sang mit Reiz durchdrungen  
Zum Ruhm verstorbner Frau'n und schmucker Herr'n."

The force of the first line, the point of the second, the charm of the third, and the pathos of the fourth, are all sacrificed. *Schmuck*, I suppose, means "spruce," which is a very stupid rendering for "lovely"; nor are *Herren* exactly "knights." Take, again, Sonnet 73. For the line—

"Bare ruined choirs where late the sweet birds sang;"

Herr Krauss gives us:—

"Zerfallne Dome einst der Vögel Welt;"

and proceeds to translate the pathetic "In me thou seest" by "Ich bin," twice over. Again, in Sonnet 29, he gives us this bad rendering:—

"Wenn ich beweine den Schiffbruch meines Lebens,  
Ich, den verstiehs die Menschheit und das Glück,"

for—

"When in disgrace with fortune and men's eyes,  
I all alone beweep my outcast state."

Indeed, the translation of Herr Krauss is less interesting to the English critic on account of its artistic merits than as a sign that German *littérateurs* are willing to adopt as fact a fiction which is far less founded upon reasonable grounds, though no less ingenious, than the *Theognis Restitutus* of Frère.

J. A. SYMONDS.

### LITERARY NOTES.

Edward Bulwer, Lord Lytton, the patriarch of the circulating library, died on the 18th of January, after half a century of uninterrupted literary activity. He was born in 1805, published poems as a mere boy, as a youth wrote a Wertherian romance (*Falkland*), afterwards disavowed, and a Cambridge prize poem on Sculpture, the only academical distinction besides the presidency of the Union which he achieved. *Pelham*, published in 1828, made him popular; *The Disowned*, *Devereux*, *Paul Clifford*, and *Eugene Aram* (1832) sustained his precocious reputation. *Godolphin* and *The Chinese Twins*, a satirical poem, were published anonymously according to a plan which he often afterwards adopted, partly perhaps from a curious, half jealous ambition, which made him wish to be always admired afresh, never taken for granted as an already successful author; and partly because his popularity, though always considerable, was

never so deeply rooted that it might not hope to gain by judicious transplantation. In 1833 his *England and the English* appeared, in two volumes of such desultory criticism as is now more habitually served out by the weekly or the daily press. His other miscellaneous essays of this period are somewhat artificial in style, and the influence of Charles Lamb and the eighteenth-century essayists is too distinctly traceable; but, on the other hand, it is certainly better to follow good models than bad or none. The novels of what may be called his second period, *Rienzi*, *The Last Days of Pompeii*, *Harold*, *The Last of the Barons*, succeeded each other rapidly, and yet left him leisure to begin a *History of Athens; its Rise and Fall*, in which he attempted to give their due weight to the literary and social forces at work in the State, and to contribute an occasional pamphlet on the exciting political controversies of his own day; at this time he was a whig. His first drama, the *Duchesse de la Vallière*, was a failure; *The Lady of Lyons* and *Money* keep the stage successfully to this day. Another poem, *The New Timon* (1846), is chiefly remembered for the attack it contains on the then rising glory of the Laureate. *King Arthur*, which shortly followed, remained a favourite with the author, who rested upon it some of his best hopes of a favourable judgment with posterity. In 1849 his style changed again with *The Caxtons*, on the whole his most popular work; *My Novel*, *Night and Morning*, and *What will he do with it?* continued the same vein. *A Strange Story* was a return to the mystical supernaturalism of *Zanoni* and other earlier works. But the veteran novelist had one more and most successful mystification in store for his readers, if, as is stated, *The Coming Race*, an ingenious extravaganza, more like a first than almost a last work, was from his pen. In the *Parisians*, now appearing in *Blackwood*, the old Bulwer Lytton is again easily recognisable. We shall hope to discuss his position and merit as a novelist more fully on the appearance of *Kenelm Chillingly*, announced as in the press, a work of which, we are assured, the author himself thought very highly. Apart from his extraordinary fertility as a writer, little need be said of his life, except that he held office for a short time under a conservative government, was infelicitous in his domestic relations or conduct, and was active in promoting a scheme for pensioning and providing for destitute men of letters. A quasi anonymous romance, *Higher Law*, published in 1871, contains a sketch evidently intended for Lord Lytton, and as such more of personality than is usually sanctioned in English literature, but his method of composition is fairly and not unskillfully represented.

The *Quarterly Review* (January) communicates some "Unpublished Letters of the Princess Charlotte," which, though they do not add much to our scanty knowledge of her short life, give us glimpses of a much more original and interesting character than the negatively good young lady whose loss was such a blow to the British public.

The *Volksthümliche Dichtungen* collected by Dr. M. Töppen, chiefly from Prussian MSS. of the fifteenth, sixteenth, and seventeenth centuries, and published in the *Altpreussische Monatschrift* for November, contain a good many interesting specimens of common place in verse. Their comparison with the *Moderne Lyrik*, very justly ridiculed by C. A. (*Im Neuen Reich*, January 17), suggests a regret that some hundreds of the most obvious sentiments respecting love, money, spring, wine, hope, stars, and destiny, cannot be made copyright in their earliest and briefest shape and reproduction—"gerichtlich verfolgt."

According to the *Gazzetta ufficiale* (January 14) Italy has of late years been inundated with a new and barbarous literature, bearing the appropriately barbarous title *selfelpista*, in which, with some difficulty, we discern a reference to the great work of Mr. Samuel Smiles. Sig. Guersoni points out with great force that a living national literature must contain something more than biographical fragments and essays on commercial morality; but while doing full justice to the good faith of Cantù, Mantegazza, Belgiojoso, Boccardo, and the other indefatigable *selfelpisti*, he perhaps overlooks the future gain to letters, pure and simple, from whatever influence helps to forward the reorganization of society and to regenerate the national energy.

## Art and Archaeology.

## WEST FRIEZE OF THE PARTHENON.

IT is well known that, when Lord Elgin removed the sculptures of the Parthenon, he left the western side of the frieze in its original position on the temple, but had casts of this portion made, which have always been exhibited in the British Museum, and are engraved in *Museum Marbles*, viii. pl. 23, 35.

A new set of casts has been recently made from the original marbles, by direction of the Trustees of the British Museum; and a portion of these casts is now exhibited in the Elgin Room, in immediate juxtaposition with the corresponding casts taken under the auspices of Lord Elgin. By comparing the two sets of casts, we see at once how deplorably the surface of the marble has suffered from exposure to the weather in the seventy years which have elapsed since Lord Elgin's casts were made.

I will note these injuries on the successive slabs referring to the plates in *Museum Marbles*, viii., and also to those in Michaelis' *Parthenon*.

Pl. xxiii. Youth on left (Michaelis, iii. 4), both arms and the face decayed, also horse's head, fore legs, and end of tail; bearded figure on right (Michaelis, 5), beard and nose decayed. Youth on right (Michaelis, 6), left hand and wrist, nose, right hand, fingers of right hand decayed.

Pl. xxiv. Left hind leg of foremost horse (Michaelis, 7) wanting from a little above fetlock, left arm of rider (†).

Pl. xxv. Left forearm, back and face of hindmost horseman (Michaelis, v. 10), hind quarter of his horse, and foreleg of horse behind him decayed.

Pl. xxvii. This slab has, by some accident, probably the explosion which destroyed the Parthenon, been broken behind the shoulder of the foremost horse. In consequence the plane of the portion of the slab on the right of the fracture is below that of the portion on the left. This inequality has been concealed in the Elgin cast by unsightly botching. The corrosion on the shoulder, neck, and hind quarter of the hindmost horse, which had slightly commenced when the Elgin cast was taken, has spread.

Pl. xxviii. The head of the man (Michaelis, viii. 15) has disappeared. The corrosion on the body of the horse has increased.

In the *Archäologische Zeitung* of Berlin for 1872, p. 31, is an interesting article by O. Lüders on the present state of the western frieze, which he was enabled to examine minutely by getting on the scaffolding erected by Signor Martinelli when he recently moulded the frieze for the British Museum. Herr Lüders notes all the holes drilled in the marble for the insertion of metal reins, &c., and the portions of bronze still remaining on the sculptures.

C. T. NEWTON.

## ART NOTES.

We learn from the *Chronique des Arts* that important changes are at this moment taking place at the Louvre in the division of ancient art. In the course of removing several statues and groups from the public gardens, in order to protect them from the effects of the weather, several fragments of Greek work have come to light. In addition to these, the collections have been greatly enriched by the number of works recently acquired. The direction has taken advantage of the opportunity thus afforded for making rearrangements, and has turned its attention specially to the placing in a proper position many statues which have for a long while been left to suffer from an unfavourable light. In the gallery of *Diane chasseresse* have been brought together all the most important examples possessed by the collection which illustrate Greek art from its most ancient date down to the period of Phidias, such as—the bas-reliefs from the architrave of the temple of Assos, in Asia Minor; those which were brought back by M. Miller some years ago from the island of Thasos; the fragment of the frieze of the cella of the Parthenon and the metope from the same temple, formerly acquired by the Count de Choiseul-Gouffier; the funeral urns found at Marathon; the bas-reliefs brought back from Macedonia by M. Heuzey, &c. The bronzes taken from the Tuileries,

and several antique fragments, are destined to decorate the grand entrance of the museum at the *Pavillon deon*, as well as the gallery which extends from this pavilion to the foot of the staircase. The following are some of the examples which have recently found a place among the antiques:—A magnificent torso of Apollo; another of Perseus; a charming partly draped Venus, and several fine heads from the Campana collection; a very fine torso of one of the numerous repetitions of the Sleeping Faun; a Bacchus, and a Venus from the gardens of the Luxembourg; a head of Caesar, admirable in character, from the Élysée; a torso of a young man, a very refined bit of Greek work, given to the Louvre in 1871 by M. Guillon, the sculptor; a head of Jupiter, of Greek work, which bears traces of colour; a small head of a young laughing Satyr.

Professor Dr. Karl Lemcke, the well-known author of *Populäre Aesthetik*, living at that time as Honorarius at Munich, has received a very flattering invitation from Amsterdam, and has accepted the post of professor of aesthetics and art-history at the Academy of Arts in that city.

The January number of the *Zeitschrift für bildende Kunst* contains an article in memory of Heinrich Petri, by Jacob Falke. Petri was born in 1833, and entered the Düsseldorf Academy when about nineteen. For some time his special tendency in art did not develop itself; ultimately he fell in with Deger, and the word went round that "Petri ist unter die Nazarener und Heiligenmaler gegangen." The article is accompanied by an illustration, an engraving from Petri's altar-painting of the "Taking Down from the Cross," the original of which is in the church of the Franciscan nuns at Nonnenwerth; this is not, however, held to be the most worthy of notice amongst this artist's work. The great altar-piece which he completed in 1871 for Lisbon lays claim to being considered his *chef-d'œuvre*. In consequence of the success of this work he received a second considerable commission, which he did not live to execute.—C. Claus contributes a notice of the Meyer collection at Dresden, which is accompanied by an admirable engraving after Meissonier by Friedrich, and also by an engraving by the same artist after Achenbach; both the originals are in the Meyer gallery.—G. Keleti continues his notice of Karl Markó.—Phil. Silvanus comments Hubert Stier's design for the German Houses of Parliament.—Bruno Meyer continues his critique on the exhibition of the Academy at Berlin. Alma Tadema's work has excited much interest, but Bruno Meyer seizes with a true instinct on the weak place in the work of this admirable artist, *i.e.* that he too often, instead of giving us a picture, gives us an illustration; that, instead of striving after the universal elements of human interest, he is too often contented to take up his stand on mere archaeology.—A. Horowitz begins a series of articles on "Kunstgeschichtliche Miscellen aus deutschen Historikern," which promise to contain many valuable and interesting odds and ends of information on German art.

Dr. Wilhelm Lübke has published the address delivered by him to the Art School at Stuttgart on the occasion of the celebration of the birthday of the King of Württemberg, under the title *Ueber Kunstpflege*. He reproaches the modern German bourgeoisie with being behind their ancestors in zeal for art; for anything like monumental art, he says, they have been beholden to princes, and points out that in this respect the South is far inferior to the North. Whilst towns like Leipzig, Hamburg, Bremen, have founded their own museums, whilst Frankfurt has its Städelsches Institut, and Köln its Wallrafisches Museum, "was können wir dem in Süddeutschland gegenüber stellen?"

The present number of *Im Neuen Reich* opens with an article on the early development of painting in the Netherlands from the pen of J. A. Crowe, which will prove worth the attention of art students. Mr. Crowe treats with pains and acuteness the obscure question of Hubert van Eyck, and also adds some details concerning the scholars of the two brothers. The article has the value of accurate technical archaeological knowledge.

The Queen has recently presented to the British Museum the bronze figurehead of a small ancient vessel, probably a barge, which was dredged up in the harbour at Actium in 1839, and was obtained at that date by Sir Howard Douglas, then Lord High Commissioner of the Ionian Islands, from whose family Her Majesty received it. The figurehead represents a female bust, helmeted, and with an Aegis on the breast, which may represent Rome. The style of this bronze is coarse, but forcible, and its date may very possibly be that of the battle of Actium, on the site of which it was found. There is an interesting notice of this figurehead in the *Transactions of the Royal Society of Literature*, 2nd series, i. p. 246.

A. Horawitz has called attention in the *Zeitschrift für bildende Kunst* to the following passage in a work of Beatus Rhenanus, which may be regarded as deciding finally in favour of Augsburg's claim to the honour of giving birth to the younger Holbein:—"Apud Germanos hodie sunt inter primos clari, Albertus Durerius apud Norimbergam, Argentorati Joannes Baldwynus, et in Saxonia Lucas Cronachius, apud Rauricos Joannes Holbeinus Augustae Vindelicorum quidem natus, verum jamdiu Basiliensis civis, qui Erasmus nostrum Roterodanum anno superiori in duabus tabulis bis pinxit felicissime, et cum multa gratia, quae postea sunt in Britanniam transmissae" (Beatus Rhenanus Selezeftadiensis *In C. Plinium*, Basileae, apud Joannem Frobenium, mense Martio, anno 1526, p. 29). The passage was probably written in 1525, as the portraits are said to have been painted "last year," while we learn from two of Erasmus' letters, bearing date respectively June 3 and September 4, 1524, that he had then recently (*nuper*) sent two portraits of himself by an "artifice satis eleganti" to England.

The following are some of the highest prices fetched at the sale of the collection of M. Théophile Gautier, which took place at the Hôtel Drouot, as previously announced, on January 14th and 15th:—P. Baudry, "Diane au repos," 6000 frs.; L. Bonnat, "Pasqua Maria," 3700 frs.; Eug. Delacroix, "Lady Macbeth," 7000 frs.; Delacroix and Poterlet, "Combat du Giaour," 3350 frs.; W. Diaz, "View in the East," 4000 frs.; Gérôme, "Panther," 8100 frs.; Ingres, "The Three Great Tragic Poets" (Aeschylus, Sophocles, and Euripides), 3600 frs.; Th. Rousseau, "Forest Scene by Moonlight," 3000 frs. Amongst the drawings, the largest sum was given for Decamps' "Dance of Albanians," 2220 frs.—The Sedelmeyer sale attracted great attention at Vienna at the close of December. A Rembrandt, "Portrait of a Young Woman," went for 8290 fl.; Ostade's "Bauernunterhaltung," 8500 fl.; Teniers' "Flemish Interior" went to 15,000 fl.; and Ruysdael's "Oakwood" to 18,500 fl. Amongst the modern pictures, "An Artist's Atelier," by Stevens, went for 8500 fl., and Knaus' "Mutterglück" for 15,010 fl.

We learn from the *Chronique des Arts* that M. Jean Gigoux intends to sell his collection of drawings of the French school of the eighteenth century. This collection, into which neither doubtful drawings nor copies have been admitted, contains all the most valued names of the eighteenth century, the two Saint-Aubin, Carmontel, Chardin, Watteau, Boucher, &c. &c. Want of space is M. Gigoux's motive for parting with them; he finds himself overburdened by his collections of drawings of the Italian, Dutch, and other schools.

Mr. Henry Woodward, of the British Museum, proposes in the *Athenaeum* to explain the singular object painted in the foreground of Holbein's picture of the "Two Ambassadors," now exhibited in the Gallery of Old Masters at Burlington House. The object has hitherto been taken for the bones of a fish, the shell of a *Venus*, a roll of parchment, &c.; but Mr. Woodward conceives it to be the image of a normal human skull distorted in a cylindrical or convex mirror. If viewed from a point close to the edge of the frame on the right-hand side, the skull loses its elongated appearance, and "erects itself into a well-shaped human cranium." He adds an engraving after a drawing by Mr. de Wilde.

## Theology.

- A Commentary on the Psalms. By George Phillips, D.D., President of King's College, Cambridge. Two Volumes. Williams and Norgate, 1872.

THIS *Commentary*, as the author informs us in his preface is "to a great extent a recast of the work on the Psalms" which he published in 1846, but differs from that work (1) "by many corrections and amendments in every part," and (2) by the substitution in numerous passages of "a new commentary and new criticisms" for the old. These changes he regards as of sufficient importance to give to the *Commentary* in its present form the character of a new and independent work. Still, a great part of the earlier publication remains unchanged. The introduction, for example—which consists of three chapters: (1) on the authorship and arrangement of the Psalms, (2) on the character of the Hebrew poetry, and (3) on the titles of the Psalms—is little more than a reprint of the introduction of 1846. These chapters are, in consequence, necessarily defective; the middle one singularly so, as its historical sketch of opinions as to the character of the Hebrew poetry stops with Lowth, no mention being made in it even of Herder or Ewald.

The earlier introduction contained a fourth chapter on Principles of Interpretation, the omission of which in the present publication is significant, and points to a change of view on the part of the author, the nature and direction of which will appear by comparing a single sentence of the omitted chapter with a portion of the new preface. In the former the author wrote, "My plan in the following Commentary has been to make the New Testament as much as possible a key for understanding the Old": in the latter he says, p. vi, "It has been my earnest endeavour to leave the Psalms to speak for themselves, to tell their own tale"; and again, p. vii, "For myself, I must say that the internal evidence is that on which I have usually depended, as the basis of a Messianic interpretation. If, in addition to this evidence, the Psalm was quoted in the New Testament, and

there treated as a prediction of the Messiah, I felt sure of such an interpretation being the correct one." In other words, the author, in the earlier commentary, followed the New Testament as his primary guide; in the present work he assigns to it only a secondary place. And, in doing so, he has but conformed to the requirements of modern criticism. For now a commentary is nothing if it is not grammatical. But what we find in the New Testament is not a grammatical interpretation but a spiritual exposition of the Old. In citing Old Testament utterances, the object of the first Christian teachers was not to set forth the actual truth which they disclosed, but rather to bring to light the germs of hidden truth which they concealed, not to elicit the doctrines and lessons which they plainly taught, but those rather which, when spiritually interpreted, they were capable of teaching. But to make this spiritual use of the Old Testament is not, to say the least, the first duty of an interpreter now. His first duty is to ascertain the grammatical import of the document before him. When this is done, he may proceed to search for deeper meanings; but if this is left undone, he builds without a foundation, and his labour is lost.

Dr. Phillips, however, does not uniformly adhere to the new canon of interpretation by which he announces his intention to be guided. It is quite evident that, though his judgment approves the new method, his sympathies are still on the side of the old. And, consequently, much of the earlier work is allowed to remain which would certainly have been altered had he been able to carry out his new view with perfect consistency. Thus, in his exposition of Psalm cix., which he still "inclines" to think Messianic, he says, "My first reason for this preference is that such interpretation has the support of the New Testament" (alluding to the citation in Acts i. 20). His second reason is that he thinks the Psalm will bear this interpretation quite as well as any other. But if he had in this case acted on the principle of allowing the Psalm, in the first instance, to "speak for itself," without reference to the citation in Acts, which he certainly would have done had that much misused citation been out of the way, he could not have failed to perceive how alien is much of the language of this Psalm from the spirit and teaching of Christ.

There are other similar instances in which the Psalms are, quite unintentionally, as we fully believe, subjected to undue pressure, in order to draw from them New Testament facts or doctrines. Thus, by *Adonai*, in Ps. cx. 5, is understood the Messiah. The *Rock*, in lxi. 4, is Christ. The words, "Thy loving kindness is better than life," in lxiii. 4 (3), are thus expounded: "The mercy through which life to come is obtained is of more value than that by which we enjoy the continuance of this life." And, to take one instance more, Ps. l. 8, "I will not reprove thee for thy sacrifices," &c. is paraphrased as follows: "I do not, saith God, complain of sacrifices not being offered . . . Do not, however, think that these are of themselves particularly pleasing to me . . . But I design by these oblations to lead you to that one great oblation which I accept as an atonement for the sins of all mankind. This great oblation will be made of which yours are the types," &c. Now we think that the author, in all this, under the unconscious influence of his personal beliefs, has lost sight of the excellent canon which at the outset he formally adopted as his guide, viz. "to elicit what may be termed the natural sense of a Psalm, such as, with reference to the circumstances under which it was written, so far as they can be ascertained, seemed the most probable; and with that sense to remain content" (Preface, p. vii).

Still, this *Commentary* contains a great deal of valuable matter. Perhaps its most distinctive feature is the large use

its author makes of the leading Rabbinical commentators. Dr. Phillips is well known as a Syriac scholar, and has naturally directed a good deal of attention to the later Jewish writings. His copious citations from these writings will be acceptable to many students. And the devout and candid spirit which pervades the *Commentary* is very commendable. Dr. Phillips never forgets that he is handling a portion of the Divine Word, and he never fails, however strong his own convictions, to treat with respect the convictions of others.

DUNCAN H. WEIR.

#### Bibliotheca Novi Testamenti Graecol. E. Reuss.

UNDER the above title, Professor Reuss, of Strassburg, expands into a volume the careful and independent section of his *History of the New Testament* devoted to the printed text. By noting the variations in 1000 selected places, he has explored the sources of the text in all the editions (nearly 600) to which he has had access. The chief fact established for the first two centuries after 1516 is the great variety of texts current, while on the other hand they are seen to be made up of combinations of readings derived almost wholly from four sources—Erasmus, the Complutensian, Estienne, and Beza: to the last-named editor the ill-gotten fame of the Elzevirs is restored. The history professedly deals exclusively with entire texts: on the discovery and publication of documents it touches only incidentally; on the criticism which leads from documents to texts scarcely at all. Hence, with all his cordial appreciation, the author can hardly give its due prominence to the special work of the seventeenth century, the accumulation and at last the study of materials chiefly by the scholars of England, Ussher, Walton, Gregory, Fell, and Mill. But he calls attention to two forgotten English editions, those of Wells (1709-19) and Mace (1729), as being the first (except Toinard's Latinising text) to introduce a mass of new readings from good MSS. As the sources used come to be documents instead of printed editions, genealogical classification breaks down. Modestly disclaiming criticism, Reuss is left without any better measure of progress than agreement with the latest critical texts, a rude standard at best, which becomes more and more misleading. Accordingly what ought to be the really important part of the history, from Bengel and Griesbach onward, leaves no distinct impression; and the incidental critical remarks are with the best intentions as loose as if Bentley, Griesbach, and Lachmann had never written. An English journal ought perhaps to notice the omission of Dr. Scrivener's reprints, in which the variations of the three latest editors is marked by difference of type; and the failure (p. 271) to seek access to Dr. Tregelles' elaborate edition, though it has been coming out at intervals for fifteen years. A writer so generous and impartial will thank us for suggesting that he might often enrich his pages from the special treatises of both these scholars. His own work, it will be seen, is disabled by its defective plan from affording the instruction which students most need; but it is full of interesting facts, obtained by a vast expenditure of labour.

F. J. A. HORT.

#### Intelligence.

Mr. P. E. Pusey is actively engaged on his new critical edition of *St. Cyril of Alexandria*. It is offered at the subscription price of 12s. per volume. The first three volumes can be delivered at once; vol. iv. in July, vol. v. in January, and vol. vi. in June, 1874. The subscription for 1872 should be sent to Messrs. Parker with that for 1873 by those who desire the first two volumes as well as those for 1873. We trust such an indefatigable worker as Mr. Pusey may some day be induced to take in hand a really critical edition of the Peshito version.

What is the characteristic of "modern" or independent theology? This question is answered in a clear and precise manner by Professor

van Bell in his inaugural lecture at Groningen, the head-quarters of the moderate orthodox school in Holland. The characteristic of the theology he professes to teach is its connection with the anthropological researches of the day. This feature does not exclude metaphysics from theology, but requires that the laws governing the phenomena of the religious life should be ascertained scientifically before examining into their permanence and foundation in human nature. The result is an anthropological in contradistinction to a speculative idealism.

We referred in our last number to Mr. Russell Martineau's acute suggestion as to the authorship of Gen. ii. 1-3. It is curious to see how nearly he anticipated it, on grounds of a necessarily subjective character, in his former papers on the narratives of the Creation in the *Theological Review*, vol. v., where he concludes in favour of 600 or 650 B.C. as the date of the first cosmogony (in its present form?). He also analyses Gen. i. into two separate narratives, though he does not distinctly say which is due to the Elohist, nor is it easy to see why the second of the two writers concerned should be supposed to have done more than bring the original eight acts of creation into a framework of six days, which of course involved a certain amount of interference with the text. (See *Schrader*, as before quoted.) Why should not this second writer be the Deuteronomist, whom Mr. R. Martineau has so well shown to be the author of Gen. ii. 1-3?

*Tradition principally with reference to Mythology and the Law of Nations* (Burns, Oates, and Co.) is the title of a work by Lord Arundell of Wardour. Its main position is the well-known but exploded position of Bryant, "that the heroes of mythological legend embody the reminiscences of the characters and incidents of the Biblical narrative," connected with which is the doctrine, defended at length against Sir H. Maine, that the maxims of the law of nations are based on a primitive tradition. The author aspires to a measure of scientific accuracy, and is scrupulously exact in his quotations and references. Unfortunately he is not always acquainted with the best authorities; thus, for Manu and the Deluge he goes to a French translation of the story in the *Matsya Purana*. He mentions the remarkable ceremony in commemoration of the deluge found by the late Mr. Catlin among the Mandan Indians, but takes no notice of the important chapter on the deluge-stories in Dr. Brinton's *Myths of the New World*. But what can be expected of a writer who is ignorant of the very language in which the best works on his subject are written?

### Contents of the Journals.

*Monatsschrift für Geschichte und Wissenschaft des Judenthums.* (Biblical articles.) December.—The so-called Little Hermon or the G'ebel ed-Duhy. [Duhy is identified with the hill of Moreh (Judges vii. 1; cf. verse 22). The well of Charod is the modern 'Ain Djahid, Cheth being often confounded by the Arabs with Djim, and Resh with Lam.]—Studies on the LXX. and Peshito versions of Jeremiah; by P. F. Frankl. [Concluded.]—January.—The LXX. Codex of Uffilas; by A. Kisch. [The first discovery of fragments of the Old Testament of Uffilas was made in 1817 at Milan by Mai. In the Book of Ezra, which Dr. Kisch examines, the text differs essentially from that of both the versions given in the LXX., and in some parts adheres more closely to the Masoretic text.]

*Jahrbücher für deutsche Theologie*, Vol. XVII. No. 4.—The mediatorial work according to the scheme of the Munus Triplex; a contribution to the history of dogmatics; by A. Krauss.—Schleiermacher's theological doctrine of God examined in its relation to his philosophical doctrines and estimated according to its scientific value; by W. Bender.—Notices of books:—Orelli's *Hebrew Synonyms of Time and Eternity* (Diessel).—Meyer's and Eadie's *Commentaries on Galatians* (Schmoller). [Gives high praise to Dr. Eadie's work, especially for its philological accuracy.]—Meyer on Corinthians, and Hausrath's *Vier-Capitel-Brief an die Corinthier* (Schulze). [Unfavourable to Hausrath's hypothesis, as unnecessary and based on a wrong view of the facts; cf. *Academy*, vol. ii. p. 37.]—Holtzmann's *Criticism of the Epistles to the Ephesians and Colossians* (Weiss). [Rejects the author's conclusions, but does justice to the thoroughness of his critical apparatus.]—Eitel's *Lectures on Buddhism* (Grill). [An attractive summary of facts. But several of the most striking parallels between the narratives of the life of Buddha and of Christ occur in writings of the pre-Christian period: this has not been observed by the author.]

*Zeitschrift für wissenschaftliche Theologie*, Vol. XVI. No. 1.—The Epistle of James examined by A. Hilgenfeld.—On Phil. ii. 6-11; by W. Grimm.—Researches on the Epistle to the Philippians; by E. Hinsch.—Luke and Josephus; by H. Holtzmann. [The writer abandons his former view that Luke may have composed not only the *hætic* passages, but the whole book of the Acts. He now thinks that the notes of time point us to the first decennia of the second century. The wider historical framework of the book is now shown to be derived from Josephus.]—Belthis again; by H. Hiltzig. [Answer to Geiger.]

—Nathanael; by O. L. ["Nathanael is the apostle Paul!"]—John in Asia Minor; by A. Hilgenfeld.—Among the notices of books, see especially that of Wellhausen on the text of Samuel, by Nöldeke; of Lagarde's *Genesis Graeca*, by Rönisch; and of Heinze's *The Doctrine of the Logos*, by A. H.

### Physical Science.

Carus' *History of Zoology*. [*Geschichte der Zoologie bis auf Johannes Müller und Charles Darwin*. Von J. Victor Carus.] München: Oldenbourg, 1872.

OF all sciences, that which deals with the phenomena of life, and is at present assuming definite shape and purpose, affords the most promising material for historical treatment. The growth of biological theory, never wholly emancipated from the trammels of superstition, from time to time receiving new determining impulses from the progress of other sciences, from the widening of men's field of vision by the discovery of new lands and new means of observation, and from the diffusion of broader views of the nature of things, has culminated in the development of a doctrine which in turn acts as a powerful source of advance on all departments of knowledge. The identification of the forces manifested in living things with the general forces of the universe, by Darwin's theory of survival of the fittest, constitutes the last great step in human knowledge: to trace, therefore, the history of that step in a complete manner, and fully to estimate the significance of its antecedents, is to point out how, when, and where all the various streams of mental activity have contributed to an epoch-making result. Such a history may well be valuable, not only as a contribution to psychology, but as a guide to the future efforts of zoologists and botanists.

Those who are acquainted with the bibliographical and educational works for which his fellow-naturalists are so greatly indebted to Dr. Carus will expect to find in a history of zoology written by him a laborious and judiciously arranged treatise. This bulky volume, one of the Munich series of histories of science in Germany, but by no means limited in its scope to that country, commences with the zoological conceptions of primaeval times, and cannot disappoint any student who desires a careful exposition of the condition of knowledge of animal forms during successive centuries.

Dr. Carus divides the history of zoology into three great periods—the ancient, the mediaeval, and the modern. The notice of the ancient period, after a short sketch of zoological knowledge in the "Urzeit," passes to the writings of the Greeks and Romans, where, of course, Aristotle stands almost alone. His knowledge of animal forms and of animal structure is methodically placed before the reader, whilst to Pliny an altogether unimportant position is justly assigned. The relation of the science of classical times to the culture of succeeding ages is discussed at some length. The decline of ancient science may be compared to the overwhelming of

an edifice by the ashes and lava-streams of a season of volcanic eruption and violence. The middle ages enveloped these ruins with mystery and contemplated them with reverence: the modern epoch has proceeded to rear new structures on these foundations. Physical enquiry in the dark ages was checked by the development of astrology and sorcery, things foreign to the hitherto dominant Greek cast of thought, whereby nature became strange and uncanny in the eyes of men—whilst further the spread of Christianity and the persecution of Christians caused a revulsion from the heathens and their philosophy. Coming to the middle ages, the stock of zoological knowledge is found to be almost wholly comprised in the popular treatise known as the *Physiologus*—of which and its successive editions, existing in almost all the languages of Christendom, and extending from the fourth to the fourteenth century, Dr. Carus gives a lengthy account. The zoological knowledge of the Arabs like that of the *Physiologus* appears to have been very inconsiderable. In the thirteenth century, the commencement of a literary activity, the revival of Aristotle, and the travels of Marco Polo are pointed out as new factors in the progress of zoology. The foundation of universities in the fourteenth century and the printing of books in the fifteenth prepare the way for the zoology of modern times, the history of which Dr. Carus dates from the first work on systematic zoology, that of Edward Wotton, of Oxford, published in 1551. The modern period is divided by the author into three minor periods—namely, the period of encyclopaedic treatment, the period of systematism, the period of morphology. We cannot but regret that it has been found necessary to give less than two-thirds of the volume to this modern period, in which the actual development of zoology has taken place; and still more are we disposed to lament that Dr. Carus should be so obviously pressed for space in his treatment of by far the most important part of this epoch, that which he terms the period of morphology. Between a fourth and fifth only of the whole book is given to this phase of the development of zoology, so brief in years, but so rich in great names and varied fruit-bearing conceptions. In the account of the encyclopaedic period we find notices of such general treatises as those of Wotton, Aldrovandi, and Gesner, and the influence of the anatomists Coiter, Fabricius, Severinus, Willis, and Harvey. The middle of the seventeenth century marks the commencement of the era of systematists, and is characterized by the introduction of the microscope into zoological research by Malpighi, Leuwenhoek, Swammerdam, and Redi, as well as by the foundation of academies of learning—the Royal Society, the *Naturae Curiosorum*, the French and Italian academies—and of public museums and gardens for the preservation of live specimens. The systematic work of Linné, led up to by the attempts of Charleton, Ray, and Klein, is the culminating point of this period of the growth of zoological science. At the same time, amongst other figures of importance whose work and influence are recorded, stand forth the first naturalist-traveller, Pallas; the first experimental physiologist, Haller; together with Spallanzani, Caspar Wolff, John Hunter, and Viq d'Azyr.

The final sub-period of the modern growth of zoology, in which it is apparently the opinion of Dr. Carus that we are still living—that of morphology—is most justly introduced with a sketch of the “*Naturphilosophie*” of Schelling, Oken, and Goethe. The doctrine of types in its various forms as associated with the names of Lamarck, Cuvier, Blainville, St.-Hilaire, von Baer, is given in only too brief a space. Pander, Baer, Rathke, and embryology; Schwann, and the cell-theory; the morphological doctrines of Müller and Owen; palaeontology; the influence of special exploring expeditions, travels, and the knowledge of faunas; the investigations of

particular groups by later zoologists—form a series of short chapters remarkable for accuracy of statement and, on the whole, just ascription of discoveries to their rightful authors. But a zoologist who reads this book will inevitably wish that Dr. Carus had given a shorter account of the *Physiologus*, and a longer one of the lives and works of the great students of animal structure; and when he comes to find the theory of the development of the animal world—identified as it is with the names of Lamarck, St.-Hilaire, and Darwin—finished off in seven pages, he will be tempted to wish that so competent an author as Dr. Carus had omitted the *Physiologus* and some of its compeers altogether.

We are not disposed to admit the wisdom of this desire, for the work as it stands is a very valuable one. Future historians of zoology will find in it a mass of material and references, and may feel themselves at liberty to pass lightly over those periods of childish extravagance, of little or no moment to the development of the science, which Dr. Carus has so carefully illustrated.

It would be wrong not to say that, in spite of the excellent introductory and valedictory chapters in connection with each section of the *History*, there is a want of perspective and proportion in the treatment of doctrines and persons which cannot be ascribed to the possibly accidental hypertrophy of the first part of the book. The explanation seems to lie not in a deficiency on the part of the author, but in the judgment of those who have drawn up the scheme of histories of science, of which series Dr. Carus' book is one.

In setting about to trace a history, it is desirable not to limit the subject of it too closely, otherwise by stringent exclusion of what seems, in the light of the initial limitation, to be foreign matter, the varied sources of true history may be lost or but partially appreciated. Physiology, botany, and zoology have been separated in the Munich scheme as three distinct subjects, the history of each of which is to be traced. No doubt valuable material will be brought together in each case, but the history of a great science will still remain to be written of which these three subjects give but a rough and ready analysis, not a logical division; that science or branch of science is biology, and its scope the reference of the phenomena of life to the general laws of matter. Had the limitations of the scheme permitted, whilst such a series of zoologists as Linné, Cuvier, Müller, and Darwin was selected as a framework, it would have been possible to illustrate in their successive grasps at the final doctrine of biology the influence of the great antecedent or contemporary physiologists, botanists, and geologists. This would have given the vast array of names necessarily cited some order more significant than a chronological one, whilst the relative size of men like Harvey, Malpighi, von Baer, Schwann, and the four named above, could have been more adequately rendered.

E. RAY LANKESTER.

## Notes of Scientific Work.

### Botany.

**Beccari's Expedition to New Guinea.**—Two letters from Beccari are reproduced in the *Nuovo Giorn. Bot. ital.* (1872, pp. 291-294). In the latest, dated Sorong, June 21, he speaks of having already collected about 500 species of flowering plants, but that the New Guinea flora is not half as rich as that of Borneo. This is a disillusion to him; on the other hand, he finds that all the north-east coasts are accessible, and that he can penetrate some distance into the interior.

**Effect of Manures on the Production of Alkaloids in Cinchonas.**—Mr. Broughton has given in a government paper, which is quoted in the *Pharmaceutical Journal*, January 4, p. 521, the results of the application of manures to cultivated cinchonas. The experiments were made at the Ootacamund plantations on *C. succimbra* and *C. offi-*

*cinalis*. The manures used were ammonium sulphate, Peruvian guano, and stable manure. No greater luxuriance was noticed in the growth of manured trees than in those not so treated, but in every case there was an increase in the alkaloids of the bark. The greatest increase was with *C. officinalis* treated with stable manure; the result was most remarkable:—

	Manured.	Unmanured.
Total alkaloids . . . . .	7.49	4.68
Quinine . . . . .	7.15	2.40
Cinchonidine and cinchonine . . . . .	0.34	2.28

The quinine is nearly trebled, partly at the expense of the other alkaloids.

**Amyloid Corpuscles in the Fovilla of Pollen.**—Saccardo has described (*Nuovo Giorn. Bot. ital.* 1872, pp. 241–243) the amyloid particles existing in the fovilla of the pollen of numerous plants belonging to very different natural families, and which are probably of general occurrence. They vary in diameter from  $\frac{1}{1000}$  to  $\frac{1}{500}$  of a millimetre. Their usual shape is circular passing to elliptical; in *Oenothera* they are fusiform. Treatment with iodine colours their nuclear portion violet.

**The Synonymy of Brazilian Ferns.**—In a paper read before the Linnean Society, on January 16, Mr. J. G. Barker criticized an elaborate monograph, published by Fée, containing descriptions and figures of nearly two hundred new species. Of these Mr. Barker was not prepared to admit more than 10 per cent. as really valid. The remainder he considered to consist of old well-known species which had not been recognised, or of mere individual forms not possessing real specific value.

**Welwitschia.**—Professor M'Nab points out in *Nature* (January 16, p. 202) that, in the appendix to his paper read before the Linnean Society, he expressed his belief, after examining Strasburger's figures of *Ephedra*, that that author is right in regarding the outer parts of the female flower of *Welwitschia* as carpellary. In the paper itself Professor M'Nab had described the outer parts as forming a perianth, a view he now abandons. To this extent the notes in the *Academy* (vol. iv. pp. 13 and 31) require correction.

### Geology.

**Coccoliths and Rhabdoliths.**—Mr. O. Schmidt has for some time past been engaged in deep-sea dredging in the Adriatic between the Apulian and the Dalmatian coasts, the greatest depth reached being 630 fathoms. At depths exceeding 50 fathoms the sea-bottom has been found to be covered with Bathybian mud, which at greater depths contains Foraminifers (*Globigerina*, *Orbulina*, *Uvigerina*, *Rotalia*, *Textularia*), as well as the peculiar flat-shaped calcareous bodies which have been called Coccoliths. Associated with them are numerous other long bodies, until now unknown, which the author has named Rhabdoliths. Mr. Schmidt is of opinion that they do not form part of the Bathybiae, but are independent organisms, which live as parasites, as it were, in the Bathybian mud, like the above-mentioned Foraminifers. It is interesting to learn that the greater depths of the Adriatic, at least in this more southern part, are extremely poor in animal life, and that higher organized forms, like Echinoderms and Molluscs, are entirely absent. The author attributes this remarkable fact to the absence of currents at those depths. Similar observations were made by Mr. Forbes in the Aegean Sea, and by Mr. G. Jeffreys in the western part of the Mediterranean. (*Sitzungsberichte der Akademie der Wissenschaften*, Vienna, 1872, p. 669.)

**The Post-Tertiaries of the Sahara Desert.**—M. C. Grad, who has spent considerable time in scientific researches in North Africa, especially in the Atlas and the Sahara, gives in the *Archives des Sciences de la Bibl. univ. Genève* of 1872 a statement of his results, which differ widely from the teachings of the supporters of the glacial theory. The author found that the Quaternary deposits, which are composed of conglomerates, sandstones, and marls yielding gypsum, and which attain great thickness at the base of the Atlas, everywhere yield only land- and freshwater-shells, as well as *Cardium edule*, which up to the present time lives in the salt-marshes of the Sahara; that genuine marine shells are never met with in these deposits; and that consequently the Sahara could not have been covered by the sea during the Diluvial epoch. The occurrence of *Buccinum gibberulum* and *Balanus miser*, as recorded by Desor, have reference to a single imperfect specimen, which until now remained unique. Moreover, the author could discover no traces of ancient glaciers in the Atlas range, and he believes that all the statements respecting the existence of moraines and ice-marks are erroneous.

**Geological Notes on Central South Africa.**—Adolf Hübner, who travelled in South Africa in 1869 and 1870, gives in *Petermann's Mittheilungen*, vol. xviii. p. 422, a sketch of the geology of the country between Pötschförm and Inyati. Round a granitic nucleus is ranged a belt of metamorphic rocks, that are much intersected by

greenstones; older sedimentary rocks are found on the southern and northern (20° S. lat.) side of this crystalline nucleus. The granite, which nearly everywhere shows the normal composition, is very poor in useful minerals. At one point only, on the Mangwe river, did he find red copper ore. The metamorphic rocks, gneiss, granulite, hornblende rock, iron mica schists, clay slate, chloritic schists, and crystalline limestone, contain no useful ores; true mica schists were not observed. The greenstones consist of a dense mixture of oligoclase and amphibole, and Hübner failed to detect any useful minerals associated near them. The sedimentary rocks, which occur at a few places, consist of beds of plant-bearing sandstones, belonging to the Karoo formation. The gold-fields on the Tati river, a tributary of the Shasha, which flows into the Limpopo, were also visited. They are situated in metamorphic rock, consisting chiefly of chloritic schists, which contain gold-bearing quartz reefs. The present yield is so small, and the necessary expenses so great, that Hübner does not expect them to prove lucrative.

**The Diamond Fields of South Africa.**—Dr. E. Cohen, of Heidelberg, in a letter to Professor Leonhard, published in the *Jahrbuch für Mineralogie*, part viii. 1872, p. 857, gives a short résumé of his observations in the diamond-bearing districts of Griqualand West. The diamond-bearing material is chiefly found in round- or oval-shaped isolated basins, which are formed by "riffs" and walls of other rocks, principally greenstones and sedimentary rocks; the latter of which is generally much disturbed and inclined. The greenstone, the "iron-stone" of the diggers, is most like olivine gabbro. The walls or "riffs" of these basins vary in their geological structure, and this is one reason why Dr. Cohen considers the diamond-bearing strata independent of the "riffs." The basins are filled with a greyish-green or greyish-yellow tufa-like mass, which encloses various other rocks, such as sandy shales, sandstones, and boulders of greenstone. None of the materials have apparently been rolled by water, and there is no indication of water having been an agent in the accumulation of the contents of these basins. In addition to the above rocks, associated with the diamond-bearing material, were observed granite and hornblende rocks, and among minerals large quantities of mica, garnet, and ilmenite, and, less abundantly, olivine, augite, and hornblende, and, probably, topaz. In Jägersfontein, Dr. Cohen discovered sapphire and gold in a fragment of granitic rock. Very remarkable are the so-called "floating riffs," which are large pieces of loose rock, surrounded by diamond-bearing tufa. The latter material is occasionally covered with porous or white chalk-like recent limestone, which not unfrequently fills up the deep fissures in the ground, caused by excessive drought; the author considers that this deposit is in no way connected with the occurrence of the diamonds, as Mr. E. T. Dunn, the state geologist of the Cape, appears to believe. Dr. Cohen is of opinion that these diamond localities represent the centres of eruptions of tufa, by which means a large share of the material of older crystalline rocks, containing the diamonds and most of the associated minerals, has been thrown up from below the surface. The diamonds were partly preserved, partly broken into fragments, which, together with the tufa, were deposited at places often widely distant. The diamond-bearing material undoubtedly more nearly resembles a tufa than a sedimentary deposit. In some instances walls or "riffs" of the basins have been destroyed, and their contents carried away by water, to be deposited in the alluvial of rivers, as is the case at the Vaal river and other places.

A short time ago a beautiful specimen of a pterodactyl was found in a quarry at Eichstädt, which shows the membrane of the wing in a perfect state of preservation. The membrane of the wing is smooth, without feathers or hairs, and is traversed by several extremely faint lines; one finger of the wing is 40 cm., the other 11 cm. in length, the membrane itself 4 cm. broad. The specimen is at present in the possession of Mr. M. Krauss, of Eichstädt, and is for sale. (*Jahrbuch für Mineralogie*, part viii. 1872, p. 861.)

### Physiology.

**The Regulation of Animal Heat in Warm-blooded Animals.**—As all animals generate heat and give off heat, the question arises, Is a constant equilibrium established between this production and loss? Such an equilibrium is generally admitted to exist for the higher animals; hence their name of animals having a constant temperature, and physiological experiment has shown this to be true, i.e. that within certain limits the temperature is maintained independently of that of the surrounding medium, or, in other words, an animal regulates its heat. As regards the nature of this regulation, authors differ, some considering that animals regulate the loss of heat, others that they regulate its generation. The question has recently been discussed by Rosenthal in an inaugural dissertation, an abstract of which is given in the *Revue scientifique*, ii. 2, p. 591. His experiments have chiefly had for their object the effects of exposure of animals to a high temperature. He finds that at temperatures between 11° and 32° Cent. rabbits vary but little in their temperature between 26° and 32°; exposed to a tem-

perature of  $32^{\circ}$  to  $36^{\circ}$ , their temperature rises to  $41^{\circ}$ – $42^{\circ}$ , while the respirations are hurried, and the pulse becomes frequent. Exposed to a temperature of  $36^{\circ}$ – $40^{\circ}$ , the temperature of the animal rises to  $44^{\circ}$ – $45^{\circ}$ , the above symptoms become still more marked, the pupil dilates, and death soon follows. In all cases the temperature of the animal is above that of the surrounding medium; it therefore constantly loses heat. If, however, the quantity of heat produced be constant, in proportion as the surrounding temperature rises, the difference between this and that of the animal diminishes, and the loss of heat on the part of the animal, which is determined by this difference, ought to diminish also. The temperature of the animal ought consequently to rise, and in fact it does rise, though in less proportion. A regulatory apparatus now comes into operation, that may either act in diminishing the generation of heat, which has not been demonstrated, or in increasing the loss of heat, which is what actually occurs. The cutaneous vessels are dilated, the periphery of the body receives a larger amount of blood, which, being warmer than the surrounding medium, becomes cooled. At the same time evaporation of aqueous vapour becomes more rapid, and this also causes considerable loss of heat. The action of the nervous system in this regulatory process is not quite satisfactorily established, but the author is of opinion that it is certainly due to its vaso-motor power.

**The Number of the Red Blood Corpuscles in Mammals, Birds, and Fishes.**—M. Malassiz (*Comptes rendus*, 75, p. 1528) describes a method by which the red as well as the white corpuscles can be readily counted. According to the method recommended by M. Potam, a drop of blood is mixed with some preservative liquid and introduced into an artificial capillary, which consists of a flattened glass tube, in which the volume is calculated for each unit of length. By means of a microscope, the eye-piece of which is divided into squares, the number of corpuscles comprised within a certain number of squares can be counted. Knowing the length of tube corresponding to the squares and the corresponding volume, the number of corpuscles in the cubic millimetre can be easily calculated. In Mammals, the number varies from 3,500,000 to 18,000,000 in the cubic millimetre. The average number in man is 4,000,000; in the camel, from 10,000,000 to 10,400,000; in the goat, 18,000,000; and in the porpoise, 3,600,000, a number exceeding that found in Fishes. Birds have fewer than Mammals: the maximum is 4,000,000, the minimum 1,600,000; the mean being about 3,000,000. In Fishes they are still less numerous, and there is a difference between osseous and cartilaginous fishes: osseous fishes having 700,000 to 2,000,000, cartilaginous fishes from 140,000 to 230,000. Thus the number of corpuscles diminishes as we descend the animal series. But the richness of the blood depends not alone on the number, but also on the surface, volume, and weight of the globules in the cubic millimetre, as well as on the amount of haemoglobin in each corpuscle. The author has not been able to solve these questions, but compares the number of the corpuscles with their dimensions. The corpuscles increase in size as we descend the animal scale, so that there is an inverse proportion between the size and the number of the corpuscles. This proportion, however, is not altogether constant, for man has fewer corpuscles than the dromedary or llama, and at the same time smaller ones. A consequence of this inverse proportion is that the diminution in number is compensated by an increase in volume. This, however, is not invariably the case, for Birds gain more by the augmentation in volume than they lose by the diminution in number, the weight of a bird's being greater than that of a mammalian corpuscle.

**Influence of the Nervous System on the Movements of the Oesophagus and Stomach.**—Professor Goltz, of Strassburg, has published, in *Pflüger's Archiv*, vol. vi. pt. xi., the following results of a recent investigation:—1. After destruction or ablation of the brain and spinal cord the oesophagus becomes persistently contracted, and the stomach exhibits lively movements. 2. Section of both vagi also induces persistent contraction of the oesophagus and continuous movements of the stomach. 3. Contraction of the oesophagus and movements of the stomach occur reflectorally through the medulla oblongata as a centre when the external skin or the abdominal viscera are violently irritated.

**Action of Nicotin on the Intestinal Movements.**—Dr. S. Basch and Dr. L. Oser contribute an interesting essay on the action of nicotin to the last part (Heft iv.) of *Stricker's Medicinische Jahrbücher* for 1872, especially in regard to its action on the movements of the intestine. They find as the natural result of their enquiries that—1. The first transient peristaltic movement coincides with the first retardation of the pulse and the first reduction of the blood pressure, and consequently occurs in Traube's first stage. 2. The tetanic contraction and the pallor of the intestine begin with the augmentation of the pressure, and continue about as long as the latter lasts. The frequency of the pulse is in the first instance lowered, but subsequently rises. Thus the tetanus of the intestine occurs in Traube's second stage. 3. Coincidentally with the reduction of the blood pressure and augmentation of the frequency of the pulse, the contraction of the intestine ceases, it becomes perfectly quiescent, and then, in consequence of renewed vascular injection, begins to be redder.

The period of rest of the intestine is thus seen to occur at the commencement of the third stage of Traube. 4. The second series of peristaltic movements takes place while the pulse-frequency diminishes for the second time, and the blood pressure gradually falls, and thus occurs at the end of Traube's third stage. 5. The second peristaltic movements appear during the period when the pulse diminishes in frequency for the second time, and the blood pressure gradually falls, and consequently show themselves at the end of Traube's third stage. It appears, then, that both the first and second period of peristaltic movements are coincident with excitation of the vagus, that is, with the first and second retardation of the pulse, and that, as the blood pressure is always below the normal at this time, and the vessels are also dilated, the intestine is abundantly supplied with blood during the two periods of peristaltic movement. This is in opposition to the view propounded by Schiff and Nasse that anaemia causes peristaltic movements. Rest of the intestines is associated with lowered excitability of the vagus and of the vaso-motor structures (exalted frequency of the pulse, lowered blood pressure, and vascular injection).

**Structure of Muscular Fibre.**—A paper on this subject appears in the *Medicinisches Centralblatt* for December 28, 1872, by M. E. Grunmach, whose researches have chiefly been made upon Insects. He places the muscles to be examined in white of egg, and in this menstruum is able to observe spontaneous contraction of the fibres which do not take place in a solution containing 0.75 per cent. of common salt. On tetanising a fasciculus with magneto-electrical shocks, a very slow contraction occurs; the extent of shortening amounting to one half the original length of the bundle. M. Grunmach maintains, in opposition to Kühne, that a sarcolemma is present in the primary fasciculi (fibres) of the muscles of Insects: at least, he ascertained its existence without doubt in the muscles of the blowfly. He gives the following general results of his examinations:—1. The structural element of transversely striated muscular fibre is the "muscle-column" (*Muskelsäulchen*), or *columna muscularis* of Kölliker. 2. The *columna muscularis* is composed of a clearly, highly refractive matrix, in which, at definite distances from each other, lie dull prismatic bodies (sarcous elements), which are either all of equal size or are alternately broad and slender. 3. The *columnae musculares* are separated from one another by an "interfibrillar" or "intercolumnar" substance, in which, besides fat drops, other granular particles are suspended. 4. A certain number of muscular columns form a primitive muscle-fasciculus, which is surrounded by a sarcolemma. 5. The prismatic bodies appear to be doubly refractive in polarized light, whilst the matrix is singly refractive. 6. The so-called yellow muscles of Insects are to be included amongst the transversely striated muscles. 7. The essential difference between the so-called yellow muscles of Insects and other muscles consists in the circumstance that in the former the conception of the *columna muscularis* and the fibrils are identical.

**Haematozoon in Man.**—Dr. T. R. Lewis, attached on special duty to the Sanitary Commissioner with the Government of India, has just published a pamphlet in Calcutta on a kind of Filaria—the *Filaria sanguinis hominis*—which he found in the blood of man. He states that in July 1872, whilst examining the blood of a native suffering from diarrhoea, he observed nine minute nematoid worms in a state of great activity, on a single slide. His colleague, Dr. Douglas Cunningham, fully coincided with him in the opinion that they were precisely the same kind as those observed by Dr. Lewis two years ago as being constantly present in chylous urine. He gives woodcuts of the Haematozoon, from which they appear to be long, worm-like animals, either presenting a granular aspect throughout, or having a hyaline membrane projecting beyond the head extremity; and a ribbon-like tail. So numerous were they that several were observed in a small drop of blood obtained from the tip of the finger by a prick with a needle. Their average diameter is about that of a red blood corpuscle, and the length forty-six times the greatest width, or about 1.75th of an inch. They appear to be constantly associated with chylous urine.

## History.

**The History of India as told by its own Historians.** The Muhammadan Period. The Posthumous Papers of the late Sir H. M. Elliot, K.C.B. Edited and continued by Prof. J. Dowson, M.R.A.S. Vol. IV. Trübner and Co., 1872.

HAVING in these pages repeatedly enlarged on Sir H. Elliot's great undertaking, and on the manner in which it is carried out by the editor and co-author, Professor Dowson, we resign ourselves simply to advert to the most noticeable literary facts brought forward by this new volume, which in every respect equals its predecessors.

That period in Indian history which is copiously illustrated by the contents of this volume extends over 167 years, *i. e.* from A.D. 1389 to 1556, comprising the decline and last struggles of the Tughlak dynasty, the inroads of Timur and his devastation of Delhi, the dictatorship of several grandees (such as Ikbál Khán and Daulat Khán) over more or less of the ruins of the empire, the Afghán dynasty of the Lódis, the reigns of Bábar and Humáyún, and, lastly, the Afghán dynasty Súr, who held India under their sway during the time when Humáyún wandered as an exile in Afghánistan and Persia. By the accession of Akbar to the throne (1556) a new period in the history of India was inaugurated.

Among the thirteen chronicles described in this volume we notice particularly three, which were hitherto altogether unknown, the contents of which are communicated for the first time. One of them is the *Tarikh-i-Mubárak Sháhí*, by Yahyá ben Ahmad Sirhindí. He was contemporary with the Sayyids, and for their history his chronicle is the chief source. According to his own statement, he wrote for the

period from 1388 till the end of his book (1448), "upon trustworthy information and personal observation." It is dedicated to the second Sayyid, who, when prince royal, held Firosapur and Sirhind, the home of the author, as fiefs from his father (p. 48). "Yahyá has no claims to be ranked as an historian, but he is a careful and apparently an honest chronicler." His work has largely been drawn upon by later historians for the history of the Sayyids.

Also the *Tarikh-i-Shér Sháhí*, by Abbás Khán Sarwání, is contemporary with the events it relates. It was a standard work on the history of the Súr dynasty, with the founder of which the author was connected by marriage. He wrote "probably not long after A.D. 1579" by order of the emperor Akbar. Unfortunately, of the three parts of the book, only the first one is extant, which contains a minute account of the origin and rise of Shér Sháh. In the other parts the author had narrated the fate of his successors till the restorations of Humáyún. Abbás Khán's work is valuable as a historical record, but of no great literary merit, and certainly to be used cautiously, as he does not seem to be free from partiality for his countrymen, the Afgháns.

The third chronicle, the *Tarikh-i-Dáúdí*, by Abdallah, is devoted to the history of the two Afghán dynasties Lódí and Súr. It has received its name from the last Afghán prince Dáúd-Sháh, who was beheaded under Akbar, A.D. 1575. Of the author nothing is known except this, that he must have written after the accession of Tehángir, that is, after A.D. 1605. The author is silent as to his sources; it is very likely that he lived contemporaneously with the greater part of the events which he records.

The other historical works are of less rare occurrence, and were known before, such as the autobiography of Bábar, &c. They have yielded much interesting matter regarding the same period as well as earlier times. The same is to be said of the appendix, in which poems of historical import by Unsuri and Salmán are communicated in translation.

If Professor Dowson, besides those of the Royal Asiatic Society and the India Office Library, had had, *e. g.*, the collections of the British Museum and the Bodleian Library at his disposal, he would have worked under much more favourable circumstances. On p. 557 he quotes a short note of Sir W. Ouseley's regarding a Persian manuscript, now in the Bodleian, which is so curious and valuable that the following description may not appear out of place. The MS., it seems, was copied for Jonathan Scott, A.D. 1782. Unfortunately it is not complete, but contains only certain, and in several places disconnected, portions of a much larger work. The author was a pupil of Biruni by the name of Abú-Sáid Abd-alhay ben Abd-alahháq b. Mahmúd Kardízi. He wrote A.D. 1049-50, during the reign of the Ghaznawí prince Abd-alrashíd, to whose name he always adds, "May God give long duration to his rule." The original seems to have contained three parts:—

1. A general history down to his time, special regard being had to the determination of the chronological dates. For the history of the Ghaznawí kings till Abd-alrashíd, it is a contemporaneous record.

2. On the festivals and festive days of different nations, with an account of their origin.

3. An essay on the history of civilisation of the then known nationalities. In the parts extant he treats at great length of the Hindus and of Northern nations, Turkish, Slavonian, and others. Even to the Hungarians (*Almaj-gariyya*) a chapter is devoted.

The whole, which probably bore the title of *Zain-alakhbár*, is worked out in the critical spirit of Biruni, whose works seem to have been the chief sources of Kardízi. It is of great literary interest in consequence of the tendencies

which it displays, and the plan upon which it is carried out, containing besides much useful information scarcely to be found anywhere else.

ED. SACHAU.

**The Gallican Church.** A History of the Church of France, from the Concordat of Bologna, A.D. 1516, to the Revolution. With an Introduction. By Rev. W. Henley Jervis, M.A., Prebendary of Heytesbury, Author of *The Student's History of France*. Two Volumes. Murray.

THIS book has two titles, of which one would be better away. On the cover it is called "Church of France;" at the head of the pages, "The Gallican Church," and on the title-page, both. Now, a "History of the Church of France," even within the chronological limits defined, it scarcely is: but it is a history of "The Gallican Church," if that name be understood to restrict the subject, not only to a history of the national Catholicism, but to a history of one special aspect of that religion.

A history of France would include the history of the Church of France; a real history of the Church of France would include a history of Gallicanism in this narrower sense—of the relations of the national Church with Rome and with the civil power. And it is possible to say that nothing less than a general history of the nation could show even this in its true significance: else we must be content if a departmental history be suggestive, without pretending to be exhaustive. And suggestive this book is: not the less so for the avowed personal opinions of the author, though these are of an order not very often combined with historical insight. He need not have argued so apologetically in his preface that "impartiality does not mean indifference." Surely nobody supposes that Gibbon's account of primitive Catholicism is "dispassionate." The question of Gallicanism is one that, to be treated seriously, requires the two postulates that Catholicism is valuable, and that it is open to dispute wherein lies the essence, or at least what are the conditions, of Catholicism. These assumptions harmonize with few minds better than with that of an Anglican of "reunionist" sympathies: and Mr. Jervis is singularly free from the incapacity to look at a question otherwise than in the light of his theory as to its solution. For an ideal Gallicanism—the principle of self-government of the national Church, opposed to absolutism either Erastian or ultramontane—he plainly enough avows his sympathy: but at the same time he confesses that in practice the fight has been between Pope and King, and that, so far as the religious conscience has been the arbiter, the Pope has won, and won because he deserved to win—because he, of the two, was the champion of religion.

Whether from an incapacity to theorise, or from a voluntary and probably judicious self-restraint, there are fewer opinions enunciated in this book than are suggested by its narrative; and in particular there is a studied avoidance of pressing tempting historical parallels, or of anything like "insularity" of treatment. Mr. Jervis is right in relegating to an appendix, as a mere episode, the negotiations between Dupin and Archbishop Wake: his sympathy with the object in view does not blind him to their impractical character. But more might have been said on the likeness, sometimes even verbal, of Gallican formulæ, like those in vol. i. pp. 259, 280, 306–9, to the English "Oath of Supremacy and Abjuration": the same disposition showing itself, on the royalist side, to avail itself of the "fallacy of many questions," and to lump together or confound the theories of the lawfulness of tyrannicide, the lawfulness of the deposition of a king by the national will, and the competence of the Pope to visit a sovereign personally with ecclesiastical censures. In fact, one is led by this book to think of the contrast between English and

French history, as less fundamental than Englishmen are pleased to assume. The general question on both sides of the Channel was the same—except in dates. There is the conflict between the royal supremacy and the papal, complicated by that between the King (often supported by the Pope) and the national liberties. But the exception made is the more important because not only were the absolute dates of each event different in the two countries, but the course of political and ecclesiastical history respectively was not parallel in time, nor were the relations of one to the other the same. In England, as in France, the sympathies of the national Church were on the absolutist side; but in England it was forced, in 1688, *τὸν δῆμον προσετραπίζεσθαι*, because the national element in the ecclesiastical controversy was more sharply defined than the theological, and was recognised to be of more importance; while in France the national question did not affect the nation, but only the crown and the superior clergy. Gallicanism and Jansenism (after the death of the great Port-Royalists) were feeblér moral forces than Anglicanism and Puritanism, by almost as much as a French Parlement of the eighteenth century differed from an English Parliament of the seventeenth. On the other hand, in France the ecclesiastical parties had the advantage to which we attribute the better fortune of England in her secular history—the continuity of the national life was preserved, and patriotism and loyalty were not party questions. Absolutism had struck deeper roots in France than in England, and some of them must be traced far into the Middle Ages; but, even at the worst period of French despotism, there was a national life of whose healthy and harmonious development it would have been unjust and premature to despair.

The common temptation of an ecclesiastical historian is to let his work sink into a series of admiring biographies of ecclesiastical worthies: so it is an error on the right side if Mr. Jervis has given less prominence than he might to the personal element of history. Of Henry IV. or Louis XIV. perhaps he was not bound to say more than he does. Of the former's religious character, he takes as favourable a view as the case admits of: he argues plausibly that he, like his grandson Charles II., sincerely preferred a mysterious religion to a common-sense or subjective one. But it is likely that very much depended on the fact that Louis XIV. was a better Catholic, perhaps a better man, than Henry VIII.; and while Mr. Jervis is not unjust to Louis personally, he seems to regard him too much as a puppet in the hands of others. And, at any rate, it was surely the duty of an ecclesiastical historian to give us life-like portraits of men like St. Cyran, Pascal, and Bossuet. For Arnould, Mr. Jervis has scarcely evaded the task; but for the rest of the Port-Royalists, it is no excuse to say that it has often been done before. We may fairly complain of it being neglected by a man who could appreciate their moral and spiritual greatness without being tempted to ignore the gloomy, unlovely tone both of their theology and their ethics.

WILLIAM HENRY SIMCOX.

**The Feudal System in Muhammadan Countries.** [*Das Lehns-wesen in den Moslemischen Staaten, insbesondere im Osmanischen Reiche.* Mit dem Gesetzbuche der Lehen unter Sultan Ahmed I. Von P. A. v. Tischendorf, Ph.D.] Leipzig: 1872.

To everybody who once had, theoretically or practically, to deal with the question of Muhammadan landed property, it will be for long afterwards a *Noli me tangere*, and will disturb his rest as some ugly phantom of a nightmare. The most intricate puzzle, the chief stumbling-block for the internal policy of British India, was the land question; and

that for this sole reason, that the old Muslim conquerors had in their heads—and generally carried out—a great variety of notions regarding property, except the very simplest one, that of personal property.

To Dr. P. v. Tischendorf we owe an addition to the literature on this subject, a treatise on the feudal system in Muhammadan countries, especially in Turkey. In an introductory chapter, the author expatiates on the different species of landed property according to Muslim law. Next the theory of the feudal system (*Iktâ*) is explained with some notes regarding its historical development. Passing over to the Osmanlis, he delineates their system from the foundation of the empire in Asia Minor till the reign of Sultan Ahmad I. (died A.D. 1607), during the most glorious period of Turkish history. By order of this sultan, a high official, Aini Alf, made a collection of feudal laws, with certain proposals regarding the best way of opposing various signs of decay already then apparent. This composition of Aini Alf's, which came out in A.D. 1609, is communicated in translation, having before been translated into French by Bélin. In a last chapter, the author treats of the decay of the feudal system, till its abolition by the Hatti-sherif of Gülkhane, in 1839. The appendix contains some useful explanatory notes, mostly of a philological nature.

From this it will appear that Dr. v. Tischendorf's book is a very acceptable gift to all those who take an interest in "the sick man." It is very well written, and gives a clear survey, condensed from various scattered materials. The sources which he has chiefly drawn upon are Mawardi, Ibn Tamâa, Hammer, Bélin, &c.

From a scientific point of view we should have wished that the author had more limited the field of his research, in which case he might perhaps have succeeded actually in increasing our knowledge on some point or other. There is an utter want of proportion between the title of the book and the book itself. Professing to treat of "the feudal system in Muhammadan empires," what does it teach us, for instance, on the feudal system of India, Egypt, Spain? Wherever Muslims settled, they followed the same theory, but it was varied according to circumstances. What is its origin? The author merely repeats what everybody says, viz. that it is of Sassanian origin. But that has never been proved. Has the theory itself undergone any important changes since the time of Abû Hanîfa, Muhammad b. Alhasan (whose *Kitâb-alsair alkabir* yields abundant materials on this subject), and Mawardi? Having hoped on these and similar questions to be enlightened by the author, we confess we are disappointed. Nevertheless we readily admit that he has produced a decidedly useful book.

A particular difficulty attaches to all investigations on political institutions of Muhammadan countries. In the first place it is absolutely necessary to get an insight into the theories as propounded by the chief law-doctors, and this is not so particularly arduous. But then the relation between these theories—which are the same throughout the whole Muslim world—and the life of the nations has to be shown and illustrated, and this task presupposes almost life-long historical researches. It is the more unavoidable as it is a far spread error to believe that public life in Muslim states was never based upon any rule but the will or whim of the ruler.

ED. SACHAU.

*Histoire de l'Empire ottoman.* Par Th. d'Oksza. Tome I.  
Constantinople : 1871.

THE author of this new and comprehensive *History of the Turkish Empire* is a Polish gentleman who has for a long time resided in Turkey and other parts of the East. He

has enjoyed ample opportunity of making himself acquainted with the institutions of the Turkish empire of our time, and with Eastern modes of thought. In the preface, p. 6, he says:—"J'ai consacré des années à réunir les faits, à les soumettre à l'épreuve d'une critique sévère; et le travail intérieur nécessaire pour se bien pénétrer d'un état social si différent de celui de l'Europe a été mon occupation principale depuis le jour où les malheurs de mon pays m'ont rendu l'hôte des Osmanlis."

The author proposes to himself to carry Turkish history down to our time, in four parts:—(a) From the time when Osman declared himself independent till the conquest of Constantinople (1300–1453). (b) The period of Turkish grandeur till the peace of Carlowitz (1699). (c) The period of stagnation and decay (till 1826). (d) The period of regeneration. This first volume contains the history of the three first rulers—of Osman and Orkhan, who founded the empire in Asia Minor, and of Murad, who first carried the victorious crescent deep into European Turkey; besides, in an introduction, the origin of the Turks is discussed, the Saljûk empire of Iconium, the circumstances under which the first leaders of the Turkish tribes rose to power and importance. It is a most interesting period in human history, and the author has succeeded in painting it in appropriate and vivid colours; he lays open before the reader the whole organism of the time, the character of the Turkish race, their institutes and warlike exploits, the condition of the demoralised and impoverished Byzantine empire, the inroads of Northern nations, &c.

The number of works on Turkish history in European tongues is legion, whilst we know of very few historians in this field besides Hammer and Rosen. Almost all books of this kind are more or less able condensations from Hammer's great and most meritorious work. But who, after him, has taken the trouble to wade through the verbose and voluminous annals of the Osmanli dynasty? who has brought criticism to bear upon the manner in which Hammer made use of his sources? Indeed, we cannot deny that very little has been done for Turkish history since Hammer, being of opinion that the work of a historian widely differs from that of any educated man who, after having amassed a certain amount of second-hand information regarding the fate of a people, begins to write their history. Turkey has mostly been the prey of the latter class of men.

M. d'Oksza cannot claim to be a Macaulay or Ranke in his line. The first condition for this would be a thorough knowledge of Eastern literature and languages, which, it seems, cannot be accorded to him. His work is based mostly upon Hammer, besides other materials available in European languages. We think he would have gained a much greater merit if he had undertaken to fill up a severely felt *lacuna* in the literature of the day—if he had composed a history exclusively of modern Turkey since 1826, of the reform in all branches in public and private life. Rosen's very useful book is, in this respect, too short and too exclusively devoted to external history. Every year, every day may make Turkey the most prominent topic of European politics, when everybody will like to inform himself of its internal life, of the very roots of its existence. And that is at present extremely difficult, regarding many subjects nothing short of impossible. For such a task M. d'Oksza would be better prepared; he would not be obliged to draw from second-hand information, and could increase and rectify the results of his investigations by personal experience and observation. Let us hope that the fourth volume, in which this period will be treated of, will give us an opportunity to acknowledge the merit of the author with less reserve.

ED. SACHAU.

*Philology.*

**Madvig's *Adversaria*.** [*Io. Nic. Madvigii, Professoris Hauniensis, Adversaria Critica ad Scriptores Graecos et Latinos. Vol. I. De Arte Coniecturali. Emendationes Graecae.*] Copenhagen, 1871.

THOSE who have been accustomed to regard Madvig as *facile princeps* among European scholars in handling the texts of Latin prose authors will marvel at the resources and fertility of mind which have enabled him to issue, as a first instalment of *Adversaria Critica*, some thousands of emendations in Greek authors. The preface to this volume—a simple and modest narrative of the study-life of the man who at present divides with Theodor Mommsen the highest honours of European scholarship—assures us that it was accident rather than choice which turned Madvig's attention chiefly to Latin criticism. A mind like his, however, was never likely to specialise unduly : and indeed his work upon Cicero would have been impossible without a profound study of Greek. Meanwhile we may congratulate ourselves upon the accidental circumstances to which, apparently, we are indebted for the *Livy* and the *De Finibus*.

This first volume of *Adversaria* consists of two parts : the first book (pp. 1–184), which is a treatise on the methods of emendation, illustrated copiously by examples ; and the remainder of the volume, which contains critical notes upon the chief poets and prose-writers of Greece, the latter of whom receive by far the largest share of Madvig's attention. Among these Plato, Plutarch, Xenophon, Thucydides, and Strabo are most copiously dealt with, but the author has not neglected the Greek orators, Aristotle, Polybius, Diodorus Siculus, and Lucian.

In a short *Praemonitum* Madvig says that no one will read more of this work at a stretch than the first two or three chapters of the first book : but, though to read the book through, however instructive an exercise, would be fatal to its being noticed in these pages for the next two or three years, we can honestly say that we have gone far beyond the limit which the author assigns to his reader's patience. Within our narrow limits, however, almost all that we can do is to indicate the salient points of the first book, which is the distinctive and characteristic part of the whole, and select from many good and not a few masterly emendations a few specimens as a sample of the style of the rest.

The true method of emendation is to scholarship what the true method of induction is to physical science : it grows

under the hands of a long series of workers. No one can, perhaps, ever formulate with complete exactness the conditions of a perfect emendation or a perfect scientific induction, but our sense of truth may be quite satisfied by particular cases in the one kind as in the other, and approximations to a true formula may be made which shall come indefinitely near the fact. Meanwhile, though no number of formulae will supply future workers with the judgment and divining power which must always supplement labour in striking out new lights, great scholars and great men of science who take the trouble to inform the world about their own method confer upon it an immense service. They show what has been the force of the long continued study of facts in moulding and tempering the habit of research, in narrowing the domain of futility and waste labour, and in concentrating the attention more and more upon the material which is strictly available. You cannot, by any logic, create a great discoverer or a great emender of texts, but you can guard the student, by pointing out the lines in which his science has been formed in the hands of his predecessors, from useless experiment, and thus keep longer alive and turn to better purpose what spark of original light he may possess.

In this view, the first book of these *Adversaria* will be of inestimable use to philological students. It is an effort to systematize the methods of emendation, or (we should rather say) of restoration of texts : to point out the circumstances which render it necessary, the conditions to be fulfilled in attempting it, and the limits of its possibilities. We say, of use to philological students, not to really advanced scholars : for, as far as method goes, Madvig does and can do no more than point out the lines of proceeding in these matters which all our teachers in Israel, by the force of circumstances, must now keep before their eyes : the only difference between him and others being a difference of native power in handling his materials. But to students it is of immense importance to have clearly pointed out to them what the verdict of the best modern scholarship declares to be the conditions of the material at the command of those who would attempt the task of restoring classical texts.

The principles of criticism laid down by Madvig are obvious enough when stated, but it does not follow that in their full extent they have been practically realised as he expounds them. Putting together into a short space what he says in various parts of the first book, we may briefly sum them up as follows. The need of restoring texts at all rests on the imperfection of the copies in our possession, an imperfection greater, on the whole, in the case of Latin than of Greek MSS., but varying very much according to a number of circumstances : the general rule however being that the most widely read authors are the best preserved. Scholars have been prone both to exaggerate and to underestimate the value to be assigned to the testimony of MSS. : some tending to adhere servilely to their tradition at the expense of sense and grammar, others inclining to correct them, whenever apparently at fault, like bad exercises. But MSS. have no absolute value : the MSS. of each separate author must be examined for themselves, and their relation to one another, and to the real text, determined according to the circumstances of the case. In any case, however, the scholar in dealing with MSS. has to deal with documents in which mistakes are sure to abound : mistakes, it should be remarked, chiefly, if not entirely, due to mere error of various kinds on the part of the scribes. In order to correct these mistakes and restore the author's real hand, it may be necessary to have recourse to conjecture, that is, the MSS. themselves may give little or no clue to the true reading. An alteration based on such

conjecture can only be admissible when it exactly suits what the sense of the context demands, and therefore requires, as well as considerable power of divination, a thorough knowledge of the author's circumstances, of the probabilities of his diction, and in general of the history and antiquities of the nation to which he belonged. But the limits of conjecture should be narrowed as much as possible by a thorough study of the best MS. tradition. It is far better to restore than to guess: and often a repeated examination of a MS. will reveal the traces of the obliterated reading, and lead to a certain restoration.

It need hardly be said that it is in this kind of restoration that Madvig excels, as will be shown by instances further on. All the best modern scholars, indeed, make it their chief aim to pursue this method: of which Studemund's Plautine studies, and Munro's beautiful restorations in the *Aetna*, may be taken as felicitous examples. The two great characteristics of modern scholarship are the habit of careful examination and re-examination of MS. tradition, and the increase of general grammatical, antiquarian, and historical knowledge.

In the first chapter of his first book, Madvig has been at the pains to distinguish the different kinds of weaknesses to which even the best MSS. are liable. These are either the involuntary errors of incorrect or ignorant copyists, or the intentional modifications which scribes have introduced into texts according to their own ideas of grammar or sense. Of involuntary errors Madvig makes six classes, under each of which he gives numerous specimens of his own corrections both in Greek and in Latin texts. We will briefly indicate these heads, and give an instance or two, under each, of Madvig's emendations.

(a) *Similar letters or syllables are confused*: as in Greek A and Δ, Θ and Ο, in Latin t and l, iu, ui, &c. In Plutarch, *Adv. Stoicos*, 32, 1, the MSS. give οὐδὲν ἀπολείπουν τῶν πραγμάτων, τοῦ ἰού, φεῖ φεῖ βοῶντες (of the Stoics' abuse of Epicurus). For πραγμάτων Madvig restores κεκραγμάτων.

(b) *MSS. are liable to erroneous punctuation and division of words*. In Seneca, *Epist.* 89, 4, Haase, giving the *ipsisima verba* of the MSS., but adding a mark of omission, edits thus: "Philosophia unde dicta sit, apparet: ipso enim nomine fatetur. Quidam et sapientium ita . . . quidam finierunt, ut dicerent divinorum et humanorum scientiam." Madvig restores, "Philosophia unde dicta sit, apparet: ipso enim nomine fatetur, quid amet. Sapientium," &c. In Gellius, vi. (vii.) 3, 34, the MSS. give "Usum esse Catonem dicit" (Tiro) "argumentis parum honestis et non viri et qui alio fuit, sed vafri ac fallaciosi." Madvig: "et non viri aequi ahaqui, sed," &c. In Thucydides, 8, 46, the MSS. give εὐτελέστερα δὲ τὰ δεινὰ βραχεῖ μορίῳ τῆς δαπάνης περὶ ἑαυτοὺς τοὺς Ἕλληνας κατατρῆναι; for τὰ δεινὰ Madvig and Classen correct τὰδ εἶναι.

(c) *Words, syllables, or letters, are omitted or repeated*. A fragment of Varro is thus quoted in Nonius, p. 248: "Socius es hostibus, socius ita bellum geris, ut bella omnia domum auferas." Madvig would write: "Socius es hostibus, hostis sociis: ita bellum geris," &c. Seneca, *Q. N.* 30, 5, most probably wrote: "Quam multa animalia hoc primum cognovimus saeculo: quam multa ne hoc quidem! Multa venientis aevi populus ignota nobis sciet": from which the scribe first wrote *negotia* for *ne hoc*, and afterwards corrected himself, so that the editions give, "quam multa negotia ne hoc quidem saeculo."

(d) *Words, syllables, or letters, not similar, omitted through haste*. In Quintilian, 5, 10, 56, the best MSS. give, "Genus ad probandum speciem minimum valet, plurimum ad refellendum: . . . nec, quod est virtus" (or "quod virtus est") "utique non potest esse iustitia" (or "iniustitia"). Out of this confusion Madvig elicits, "nec, quod virtus est, utique

est iustitia, sed, quod virtus non est, utique non potest esse iustitia."

(e) *The ending of a word is erroneously altered to suit the case or number of a following word* ("accommodatio grammatica"). Cic. *De Inv.* 1, 91, wrote: "Quodsi non P. Scipio Corneliā filiam Ti. Graccho collocasset atque ex ea duos Gracchus procreasset, tantae seditiones natae non essent." Gracchus was altered into Gracchos to suit *duos*, and hence Scipio is represented in the MS. text as the husband of his own daughter.

(f) *Notes or glosses are erroneously given as part of the text*. Thus, in Plato, *Rep.* 2, p. 364 E, Madvig thinks that ἡδονῶν is a mere gloss on παιδείας.

Distinct from all these is interpolation proper, or intentional tampering with the text, whether by insertion, or omission, or alteration of words, by the scribe. In some cases it is difficult to distinguish this from mere error: as in Sen. *Epist.* 14, 14, where the best MSS. give, "Sed postea videbimus an sapientiora perdenda sit;" edited, "an sapienti opera perdenda sit," but emended by Madvig, "an sapienti opera r. p. (=reipublicae) danda sit": *perdenda* having arisen, in his opinion, from *r. p. danda*. A clearer instance is Justin, 7, 6: "Post hos bello in Illyrios translato multa milia caedit: urbem nobilissimam Larissam (capit. Hinc Thessaliam) non praedae cupiditate, sed quod &c. . . improvisus expugnat." Capit. *Hinc Thessaliam*, in brackets, is Jeep's reading: some MSS. for *hinc* give *hic* or *hic in*. Madvig considers *capit* to be the correction of a scribe, who wanted a verb, for *caput*: and that Justin wrote, "Larissam (caput hoc Thessaliae) . . . expugnat." A more brilliant example of Madvig's power is his emendation of Plato, *Legg.* 1, p. 633 D. Plato there is made to speak of θωπείαι κολακικαί, αἱ καὶ τῶν σεμνῶν οἰομένων εἶναι τοὺς θυμούς κηρίους ποιοῦσι, or μαλάττουσαι κ. π. Now in Bekker's best MS. κηρίους is only put in in the margin: a later MS. inserts it in the text after ποιοῦσιν, and in the same MS. a second hand adds μαλάττουσαι. The cause of these additions Madvig discerns in the word ποιοῦσιν, a corruption misunderstood by the scribe, which he simply corrects into πτοιοῦσιν: αἱ καὶ τῶν σεμνῶν οἰομένων εἶναι τοὺς θυμούς πτοιοῦσιν.

The second chapter of the first book treats of the method of restoring true readings from the MSS. themselves, or from the traces which they offer. We give three instances of Madvig's skill in this proceeding. In the *Theaetetus*, p. 175 C, Socrates is speaking of the effect produced on the common mind when the philosopher attempts to draw it from the consideration of men's ordinary talkings and questionings to higher things. An instance of these questionings is εἰ βασιλεὺς εὐδαίμων κεκτημένος τ' αὖ πολὺ χρυσίον (so the editions). But the Oxford MS. omits πολὺ. Now Hesychius has the following glosses: ταῖς, μέγας, πολὺς: ταῖσας, μεγάλινας, πλεονάσας. Evidently the true reading must be, εἰ βασιλεὺς εὐδαίμων κεκτημένος ταῦ χρυσίον: Plato quoting a popular word of common (though not literary) usage. Seneca, *Ep.* 92, 12, says, according to the best MSS., punctuated by Madvig, "Itaque non est bonum per se munda vestis, sed munda vestis electio, quia non in re bonum est, sed in electione quali (ποιᾷ). Actiones nostrae honestae sunt, non ipsa quae aguntur." This gives far better sense than the common reading of the editions, "sed in electione, quali actiones nostrae honestae sunt," &c. Seneca means that excellence lies in the *quality of our choice*. Ovid is made to say in the common editions (*A. A.* 3, 440), "Vix mihi credetis; sed credite! Troia maneret | Praeceptis Priami si foret usa sui." But the best MSS. have *Priame, tuis*, for *Priami, sui*. *Priame* stands simply for *Priamei*, vocative of *Priameis*, i.e. Cassandra. "Troia maneret, Praeceptis, Priamei, si foret usa tuis." We have not space

to notice other brilliant restorations in this chapter, as *ε. g.* *Πρωποίτου θυγατράσιν* for *προσπάλου θυγατράσιν* in Plutarch (*περί τοῦ, ὅτι μάλιστα τοῖς ἡγήμοσι, &c.*), p. 118.

The third chapter contains a number of restorations of proper names obscured in MSS. We may notice in particular *Ευδικίους* for *οἱ δ' ἐκείνους* in Strabo, 5, p. 242 (p. 132): *Συμαίθου καὶ Παντακίου βρόντων* for *συνελθούσαι καὶ πάντα καταβρόντων*, *ib.* 6, p. 267 (p. 133): καὶ *Νηλέως* for *καλῶς* in Lucian, *Adv. Indoctum*, 4 (p. 143).

The fourth chapter is a short treatise on the extent to which MSS. are liable to err in matters of grammar, which resolves itself chiefly into a protest against those scholars who have refused to accept the distinctions laid down by Madvig between the use of the aorist and the future infinitive.

Madvig seems to us far less happy in dealing with the poets than with the prose authors of Greece. To see what a poet could not have written is easier than to guess what he must have written. Not only are the corrections which Madvig proposes, to our mind, seldom convincing, but he professes (perhaps as a propitiation of Nemesis) to think it possible that Sophocles could have written *κούδεις ἐπίσταται μοι συλλαβεῖν τόπος* (p. 209). H. NETTLESHIP.

*Sexti Aurelli Propertii Carmina.* By F. A. Paley. Second Edition, Bell and Daldy, 1872.

GRATIFYING as the fact will not be denied to be that a second edition of an author so difficult and, for various reasons, so little read in England as Propertius has been called for in the space of twenty years, it is disappointing to know that in that interval little, if anything, has been done to clear up the obscurities of reading and meaning which the laborious care and admirable scholarship of Hertzberg had left unsolved. No one, we think, who has investigated the style of Propertius will feel satisfied with the flimsy and quite inadequate performance of the latest continental editor, L. Müller: still less with the gratuitous and absolutely groundless transpositions of Dominico Garutti's *Cynthia*, a work which, if possible, would make criticism impossible. Yet how much remains to be done still! Are these obscurities hopeless? We are persuaded that they may still be unravelled, and we are confident that the path to their interpretation is yet open to anyone who will patiently ransack the less explored fields of Greek and Roman literature, *e.g.* poets like Callimachus, Lycophron, and Apollonius Rhodius, with their scholia, or, again, such information as is contained in the varied and miscellaneous remains which constitute the *Fragmenta Historicorum* and *Geographorum Græcorum*. In one word, Propertius wrote like a learned man, and with very little simplicity; and he must not be interpreted as if his language were anything short of complex or his allusions anything but easy to discover.

We are doing Mr. Paley no injustice when we say that his edition, useful and suggestive as it is, does not, in the above mentioned particular, attain to the highest mark—perhaps a life's study only could: and yet from an editor of Aeschylus we had looked for more certainty. There are, we think, many interpretations in this edition which a repeated study of the author makes not only improbable, but certainly wrong; there are cases where a more recondite MS. reading is either ignored or rejected without sufficient investigation; some where the editor has unnecessarily admitted conjectures—a fault, however, from which Mr. Paley is, compared with the latest continental editor, fortunately free. And is not Mr. Paley unjustifiably severe on one of the greatest of philologists, Scaliger? or could Scaliger have proposed so bad an emendation as

*Aut quid tibi Chii, tibi praeunt carmina lecta?*

or *Auersis rhythmis cantas?* It would have been more satisfactory, at least to English admirers (and they are more than might be supposed) of Propertius, if Mr. Paley, instead of crowding his pages with the crudities of L. Müller, had weighed more deliberately the observations of that older school of critics who, like Barth and Passerat, concentrated their learning on clearing up the difficulties of the text, without seeking the doubtful cure of conjecture, or, again, had not neglected or ignored those occasional solutions of difficulties which, out of the way of foreign editors, were in the immediate reach of an Englishman. We allude *e.g.* to the difficult lines, *iii.* 26, 81–84:

*Nec minor his animis, aut si minor ore, canorus  
Anseris indocta carmine cessit olor,*

on which Professor Munro has written a short article in the *Journal of Philology*, *ii.* p. 143. We have little doubt that the main view there put forward, *viz.* that *haec* and *animis* refer, not to the *Eclogues* and *Georgics* together, but to the *Eclogues* alone, is right; and this whether we accept Ribbeck's transposition and Munro's *Anseri* or not.

The most interesting part of Propertius to most readers is the first four books, which are mainly occupied with the various phases of the Cynthia amour; but it is the last, in this edition the fifth, book on which Mr. Paley has accumulated most new material, and where his commentary has, in his own judgment, most claim to originality. We offer the following remarks here. In *i.* 31, for *Luceresque coloni*, the Naples MS. gives *Soloni*, and that this nominative plural is right is probable, not only from the first reading of the Hamburg MS. *solemni*, but from the comparative rarity of the word. Hertzberg remarks on the miraculous coincidence of this, to him, mistaken reading with Dion. H. *ii.* 37, *ἦκε δὲ αὐτῷ Τυρρηνῶν ἐπικουρίαν ἱκανὴν ἐκ Σολωνίου πόλεως Λοκόμαν*; it is at least equally probable that the poet and the historian are alluding to the same tradition. Mr. Paley has himself called attention to the fact, so signally true of Propertius, that his allusions are, to the less known, more recondite legends, *e.g.* when he makes the Simois of the Trojan Ida the birthplace of Jupiter (*iv.* 1, 27), or represents Melampus as submitting to imprisonment from love of Pero, whereas the ordinary story makes the lover of Pero to be Bias, Melampus' brother (*ii.* 3, 53). In the same elegy we cannot approve of Mr. Paley's transpositions of *vv.* 83–86, necessitating, as this does, so improbable an interpretation of *vv.* 81, 2, as he is induced to give; for that *iterata* can either mean “hackneyed” or is equivalent to *iterata sunt* is, in our judgment, equally improbable. Lachmann, in his unpretending but admirable edition of 1829—as far above his former edition as his *Lucretius* is above both—points out the construction; *obliquae signa iterata rotas* begins a new clause, which, with *vv.* 83–86, depends on *Dicam*: then the words *Troia cades et Troica Roma resurges* are a sudden apostrophe, quite in Propertius' style. In *v.* 3, 56, *Illa tui partem vindicat una toro*, we demur to the meaning “vindicat sibi partem quam tu debebas (solebas) capere in toro,” which would surely require *tuam*; the idea seems to be that the lap-dog is the only thing which is admitted to its mistress's couch as claiming some part of the affection which belonged to the husband, literally, “she alone claims some part of you as her own.” In *v.* 7, 64, *Narrant historiae pectora nota suae* is at least intelligible; the two wives, Andromede and Hypermnestre, faithful bosoms well known to the annals of their country, each tell their story: the harshness of the naked *narrant* is quite relieved by being drawn out at greater length in the following lines, *Haec queritur—Narrant Hypermnestre*: in *v.* 78 of the same elegy, *laudes meas* must surely be “praising me,” not “the credit you gain from me.” In

v. 8, a difficult elegy, and one in which Mr. Paley's commentary seems to us less trustworthy than usual, we should prefer to take *primo temone* with *sedens*, not with *pendit* (21); to explain *impuros* (22) as "disreputable," not "rough"—a meaning which the use of *purus*, like *καθαρός* for "clear," "unimpeded," hardly justifies; to interpret *Recidit inque suos mensa supina pedes* (44) of the table toppling over and falling backwards, rather than of the movable slab slipping from the top, in which case *in suos pedes* is, to say the least, obscure; to explain *gaudet in exuviis* (63) not like *gaudeat in puero* (ii. 4, 18), but in the same sense as *cum fuit in tunica*, i.e. holding in her hands the tatters of dress and shreds of hair which are the signs of her rival's defeat: lastly, to retain, as Mr. Paley himself half inclines, *toto toro* (88) against the more decorous, less characteristic *tuto*. In book i. 20, *Ah! dolor! ibat Hylas, ibat Hamadryasin*, we do not know whether any one has noticed the close correspondence of the expression with a line in Parthenius (Ἐρωτ. Παθ. xiv. 22), Αἰτὸς δ' ἐς Νύμφας ὤχετ' Ἐφροδιδάας: a correspondence sufficiently marked, we think, to determine the construction of *Hamadryasin* after *ibat*, not, as Hertzberg, after *dolor*; the probability is scarcely weakened by the fact that the nominative in the line quoted by Parthenius is not a person, but a pail (γαλός). That Parthenius was known to Propertius is likely not only from other resemblances, e.g. the story of Tarpeia betraying her country to Tattius, and as a punishment being buried beneath the shields of his soldiers, as compared with Parthenius' narrative of Peisidike betraying Methymna to Achilles, and being stoned by his army in consequence (Ἐρωτ. II. xxi.), but from the attraction which such a writer would have, partly as the narrator of the less known love-stories, partly from his connection with Propertius' great predecessor in elegy, Cornelius Gallus, to whom the book Περὶ Ἑρωτικῶν Παθημάτων is dedicated, partly from the favour which, according to Suetonius, Tiberius extended to this recondite and somewhat affected author.

The editor of this *Propertius* may fairly be congratulated on the general tone of his commentary. He might have been pedantic or squeamish: he has avoided either fault. No one will, we think, complain that he has dwelt unnecessarily on vicious terms or allusions; still less that an over-sensitive morality has deterred him from stating as much as is indispensable to a proper understanding of his author. Mr. Paley has sufficient sympathy with the description of one of the most genuine passions extant in the writings of classical antiquity, not to offend in either direction.

R. ELLIS.

#### THE LATE VICOMTE DE ROUGÉ.

THE death of Vicomte de Rougé makes a gap in the ranks of the Egyptologists greatly to be deplored. His earliest contributions to Egyptology were in 1846, when he reviewed the first volume of Bunsen's *Egypt's Place in the World's History*, and pointed out the necessity of a more careful analysis of the Egyptian texts than had hitherto prevailed. This was followed by a series of articles in the *Revue archéologique*, in which various texts were discussed with accuracy and extraordinary ability. Two translations, one of a stele in the Papalacqua collection, the other of the so-called statuette Naophore in the Vatican, appeared in 1849 and 1851, but unaccompanied by the original texts or by explanatory commentaries. In the *Mémoire sur l'Inscription du Tombeau d'Ahmès* (1851), M. de Rougé discussed every word and sign with minute care, and set an example of the method of treatment which alone can lead to satisfactory results. In 1852 he published a translation of a considerable part of the D'Orbigny papyrus (*Tale of the Two Brothers*), of which he was fortunate enough to obtain the perusal, long before the text was published by the British Museum. In 1856 appeared a translation of the poem of *Pentaur*, from the Sallier papyrus No. 3, and this was followed by a careful analysis of the curious stele in the Bibliothèque Nationale, relating to the cure of an Asiatic princess who was possessed by an evil spirit. In 1860 commenced the explanation of the Ritual in

the *Revue archéologique*, and in this year M. de Rougé was installed in the chair of Egyptology in the College of France, where for many years his lectures were attended by a small but appreciative auditory, to whom he expounded the principles of careful analysis upon which he himself proceeded. In 1863 he went upon a mission to Egypt, and brought back a rich harvest of inscriptions. The *Recherches sur les Monuments des six premières Dynasties*, a work of great care and elaboration, appeared in 1866, and in the same year was commenced the publication, in parts, of a Hieratic Ritual from papyri in the Louvre. This work, unfortunately, is yet incomplete. The *Chrestomathie égyptienne*, a systematic introduction to the study of the Egyptian language, was begun in 1867, and a second fascicule appeared in 1868. Papers on the Pianchi stele of Gebel Barkal, on the intercourse of European nations with Egypt, and on many inscriptions of historical importance, have also appeared from the pen of M. de Rougé during the last ten years, and our catalogue of his contributions to Egyptological science must not be considered by any means a complete one. A scrupulous philological accuracy is the distinguishing characteristic of all of them, and no writer in the school of Champollion has been more successful in the scientific application and expansion of the principles of the great master.

M. de Rougé had the singular happiness of having a son who shared the enthusiasm of his father for Egyptological research, and who has already distinguished himself by various articles of great merit, principally in the *Revue archéologique*.

#### Intelligence.

Professor A. Weber's essay on the *Rāmāyaṇa*, which was published in the *Abhandlungen* of the Royal Academy of Berlin, and of which an English translation, by the Rev. D. C. Boyd, appeared in Mr. Burgess' *Indian Antiquary* for April, June, and August, 1872, is beginning to be severely commented upon by Hindu scholars. It will be remembered that the paper referred to attempts to prove that Vālmiki, the composer of the Hindu epic, was acquainted, either directly or indirectly, with Homer's *Iliad*; and that the main plot of his composition—the abduction of Sītā to Lankā (Ceylon), as well as several other incidents—were taken from the Greek poem. Professor Weber also maintains the story of Rāma, as contained in a Buddhist treatise, the *Daśaratha Jātaka*, to be a more ancient version of the legend, not yet adulterated with elements of Western origin. The current weekly numbers of the *Native Opinion*, of Bombay, contain a very able and dignified review of the essay, by Mr. Kāshināth Trimbak Telang, "Was the *Rāmāyaṇa* copied from Homer?" being a paper read, on September 2, 1872, before the Students' Literary and Scientific Society at Bombay. This writer endeavours to refute Professor Weber's arguments one by one, showing no ordinary acquaintance with Sanskrit literature and the writings of European scholars. Particular stress is laid on the total want of correspondence in the delineation of the various characters introduced in the two poems. The first number of Mr. Mookerjee's *Magazine* (July 1872) also contains a brief notice of the essay, by Bābū Rājendralāl Mitra, who, without at all entering into the merits of the case, tries to pooh-pooh the matter, and to treat the whole discussion as a joke of Professor Weber's. He also believes that European *savants* are generally disposed to receive Professor Weber's views as facts. We are not, however, aware of any European scholar having as yet expressed his opinion on the matter, either for or against the views of Professor Weber.

It will be satisfactory to Sanskrit students in this country to learn that the catalogue of the Sanskrit books in the British Museum is now complete, and may henceforth be consulted in the Reading Room. It is to be hoped that so valuable a contribution to Sanskrit bibliography will be made available to all students. Next to the library of the late Professor Goldstücker, the British Museum probably contains the most complete collection of printed Sanskrit works; and no catalogue of the former being, as far as we know, in preparation, the trustees would no doubt render a good service to Sanskrit scholars by allowing their catalogue to be printed.

#### Contents of the Journals.

Kuhn's *Beiträge* (VII. 3) consists this time of only two articles. The one by Spiegel, on Burnouf's Zend investigations, combats the prevalent supposition "that Burnouf obtained his results by means of comparative philology; that he discovered the meaning of Zend words by comparison with Sanskrit; and that he thought next to nothing of the assistance of tradition—in fact, Spiegel asserts that he entirely departs from tradition in only twenty-eight words out of a thousand." The other is by Fick, on Lagarde's Phrygian glosses. By means of these he proves that the Phrygians were not only Indo-Europeans, but that they were more closely related to the Aryans of Europe than of Asia; whether of the north or of the south of Europe, he leaves to be decided another time. As to *ἄνω*, "above," the most certain analogue

occurs in the Gaulish *ver-*, Welsh *guor-*, *gor-*, and *gwar*, *ṛb āwa*; nor need ἀδάμειν (= φιλειν) be Iranian—compare the Old Irish proper name *Adamán*.

*Zeitschrift für vergleichende Sprachforschung*, Vol. XXI. Pt. 2 and 3.—This double number is chiefly devoted to "Umbrian Studies," by J. Savelsberg. [The article (or book, for it occupies 140 pages) calls for a detailed examination. The matter is arranged under the different phonetic changes exemplified; and several collateral subjects are discussed, in particular (under the change from *v* to *h*) questions relating to the Greek and Latin conjugation.]—Miscellanea, by H. Kern, are—(1) *gāvi*, "cow;" (2) the Oscan perfect in *-tte*; (3) the Oscan words *bratēis* and *cadeis*.—E. Windisch reviews Dr. H. Brunnhofer's *Fäla, Lac, the Græco-Italian Name of Milk*. [Rejects, after a most careful examination, the author's theory that the root is *gal*, "to swallow," and proposes *gal*, "to drip," instead.]—Schweitzer-Sidler reviews several important recent books:—Enderis, *Versuch einer Formenlehre der oskischen Sprache*; Abel, *Ueber einige Grundzüge der lateinischen Wortstellung*. [Thoughtful, connecting language with psychology.] Ascoli, the German translation of his *Corsi di Glottologia*; Hadley, *On the Nature and Theory of the Greek Accent*; Whitney, *On the Nature and Designation of the Accent in Sanskrit*. [Papers from the Transactions of the American Philological Association, 1869–70, which have been noticed in the *Academy*.] *Mémoires de la Société de Linguistique de Paris*, t. i. 4<sup>o</sup> fasc. [Valuable papers.]—Rumpelt, *Die deutschen Pronomina und Zahlwörter historisch dargestellt*.—Works of Professor Elia Lattes, of Milan, viz.: (1) *Osservazioni sopra alcune Iscrizioni etrusche* (Memoria del professore Elia Lattes, s. corresp. del R. I. Lombardo; 9 dic. 1869); (2) *Osserv. cet.*, lette nell' adunanza del 9. nov. 1871, del R. I. Lomb. di scienze e lettere; (3) *Osserv. intorno alle Epigrafi etrusche fiorentine del tipo dell' undecima bilingue*, lette nell' ad. del 28 dic. 1871; (4) *Intorno alle Ep. etr.* (Fabr. 384–397) del t. dell' und. bil., ed intorno ad altre unilingue, comprese fra numeri (Fabr. 73–231); osserv. lette nell' ad. del 25 gennajo 1872; (5) *Intorno ai tipi delle Ep. latine dell' Etruria*, confrontati con quelli delle Ep. etr.; osserv. presentate nell' ad. del 21 marzo 1872; (6) *Intorno alle Unilingui etr.* (Fabr. 402–462 ter) del t. dell' und. bil. ed intorno alle varietà di quel tipo; osserv. pres. nell' ad. del 21. m. 1872. [The result of these investigations, which Dr. Schweitzer-Sidler accepts as certain, is that Etruscan is an Indo-Germanic language, one of the Italian group; and that the inscriptions contain chiefly proper names, among them a large proportion of female names. They offer a rich harvest for the subject of Italian declension, word-formation, and nomenclature, and are of the highest importance for Italian phonetics and palaeography. It is reported that Corssen has arrived at similar results.]—Leskien reviews Miklosich, *Die slavischen Elemente im Neugriechischen*. [The influence of Slavonic on modern Greek has been very slight: that of Albanian has been the most important, next that of Romance and Turkish.]—Gothic *vopija*, "I call;" by Joh. Schmidt.—Two Indian similes, by Windisch. [Exemplify the use of the potential, as in Homer.]

**The Indian Antiquary.** Part IX. Bombay, September 1872.—Biographical Notices of Grandees of the Mughul Court; by H. Blochmann. [Continued; on the titles in use at the Delhi court; biography of Vazir Khan Hakim 'Alim Uddin; and Rājah Basu of Nūrpūr in the district of Kāngrah.]—On the Bhar kings of Eastern Oudh; by W. C. Bennett. [This dynasty appears to have reigned from about 1100 A.D., their kingdom stretching from Malwa to Mirzapur and Faizabad, with its principal strongholds at Kalangar and Karra; and was overthrown by Nasiruddin in 1247 A.D., when the last kings, Dalki and Malki, were slain under the walls of the Dalman fort.]—A specimen of Kashmiri: *The Dastān Sheikh Shibli*, in Kashmiri verse, with an interlinear and a literal translation; by G. W. Leitner.—Translation from the first book of the *Prithirdja Rāsau*; by Kavi Chand Bardāi. [A paraphrase of the first book, except the introductory portion.]—The Bhūtas of Nagara Malnād in Maisūr; by V. N. Narasimmiyengar. [On the superstition, worship of demons (bhūtas), &c. in Mysore.]—Bengali Folklore: Legends from Dinajpur; by G. H. Damant. [Continued.]—Review [favourable] of M. A. Sherring's *Hindu Tribes and Castes as represented in Benares*.—Correspondence.—Part X. October 1872.—Stone Monuments in the district of Singhbhūm; Chotā Nāgpur; by V. Ball. [On the practice of the Chotā Nāgpur Kols to erect monuments to their deceased friends.]—Notes on the *Rasakallola*, an ancient Oriya poem; by J. Beames. [Continued.]—The Caves of the Brazen Glen and other remains about Mauje Pātna, Taluka Chalisgaum; by W. F. Sinclair. [Description of some caves, supposed to have been viharas, in a valley in the Sātmalā range.]—The Date of the *Nyāyakusumānjali*; by Kashināth T. Telang. [Contests Professor Cowell's determination of the date of that work (twelfth century), by showing that Udayanāchārya, its author, was a different writer from the Udayana who has commented on a work of Vāchaspathimīśra. According to the writer's reasoning, the *Kusumānjali* cannot have been composed later than the eleventh century.]—On the Date of Patanjali, and the King in whose reign he lived; by R. G. Bhandarkar. [From a passage in Patanjali's commentary on Pāṇini, the *Mahābhāṣya*, Professor Goldstücker maintained

that Patanjali must have lived about 144 B.C. Mr. Bhandarkar now adduces another passage, which seems to point to Pātāliputra as the residence of Patanjali, under King Pushpamitra, who probably reigned from 178 to 142 B.C.]—On the *Vṛikathādhā* of Kshemendra; by G. Bühler. [Somadeva, the author of *Kāthāsarisūgāra*, states that his work contains the essence of the *Vṛikathādhā*, written by one Guṇādhya in Prākṛit. It is also evident from Daṇḍin and Subandhu that such a work existed in their time, and that it was divided into sections called lambas. Dr. Bühler now has discovered a MS. of a *Vṛikathādhā* in Sanskrit, by Kshemendra, in lambas, wherein the author states to have rewritten Guṇādhya's work in Sanskrit.]—An Interesting Passage in Kumārila Bhaṭṭa's *Tantravārttika*; by A. C. Burnell. [In this passage Kumārila (seventh century) mentions some Telugu words which are still current.]—Sketches of Mathurā; by F. S. Growse. [Continued: IV. Barsāna and Nandgānw. The former town, the home of Krishna's favourite mistress Rādhā, dates from the time of Rūpa Rāma, a Kāṭhā Brahmin and Purohita to Bharatpur, Sindhia, and Holkar. Nandgānw, the reputed home of Krishna's foster-father, is said to have been founded by Rūpa Sinha, a Sinsinwār Jāt.]—On some Eminent Characters in Sanskrit Literature; by Sashagiri Śāstrī. [Account of Vikramāditya (Vikramārka); and Bhoja, king of Dhārā in Malwa.]—Asiatic Societies.—Miscellanea.—Part XI. November 1872.—Kirtans, or hymns from the earliest Bengali poets; by J. Beames. [Six popular Vaishṇava hymns, Bengali text and English translation.]—The Celts of Toungoo; by F. Mason. [Descriptions, illustrated, of ancient stone and copper implements, found in Burmah. The writer supposes them to have been introduced in former times from India and China; as copper and basalt, and other stones of which they are made, are foreign to Burmah.]—Dondra Inscription; by T. W. Rhys Davids. [Elu (ancient Sinhalese) stone inscription of a king, Sanga Bo, supposed by the writer to date from about A.D. 712.]—Nārāyaṇ Svāmī; by the editor. [Historical account of Nārāyaṇ Svāmī and his sect in Gujarāt and Kāthiāwād. The founder of the sect was born at Chupiyā, near Ayodhyā (Oudh), in 1780, and died at Dādā Khachar in 1829.]—Some Account of the Pālis of Dinajpur; by G. H. Damant. [Account of the customs of this tribe, which are in many respects peculiar, and different from those of other Hindus.]—On some Eminent Characters in Sanskrit Literature; by M. Sashagiri Śāstrī. [Continuation: Kālidāsa.]—Śrāvāṇa Saturdays in Southern India; by V. N. Narasimmiyengar. [Account of a vow made in honour of the god Śrīnivāsa Svāmī of Tirupatī, consisting of a begging excursion on Saturdays in the month of Śrāvāṇa.]—Bengali Folklore: Legends from Dinajpur; by G. H. Damant. [Continued.]—Manga Rāja's or Kavi Manga's *Abhidhāna*; by F. Kittel. [Account of a MS., discovered by the writer in the Rāja's library at Maisur, of a hitherto unknown Canarese dictionary of considerable value, entitled Manga Rāja's *Nighaṇṭu*.]—Archaeology in the Kṛishṇā District. [Extracts from the Proceedings of the Madras Government, June 7, 1871: Letter from Sir W. Elliot to the Under Secretary of State for India.]—On the Gonds and Kurkus of the Baitul District; by W. Ramsay. [From the Report on the Land Revenue Settlement of the Baitul District: Accounts of those two tribes, both of which claim a Rājput origin. The language of the Gonds is said to contain no element of Sanskrit or other roots of the present Hindu language; whilst that of the Kurkus is held to have a decided affinity to Telugu.]—Asiatic Societies.—Review [favourable] of F. Kittel's *Yajñatantrasudhānidhi*, Mangalore, 1872; by A. B.—Correspondence and Miscellanea.

**The Pandit.** Vol. VII. Nos. 74–77. Benares, July–October 1872.—The *Ṣabdakhaṇḍa*, or fourth chapter, of the *Chintāmaṇi* (a celebrated work on the Nyāya philosophy), with Ruchidattamīśra's commentary. [Continued.]—The *Brahma-mīmāṃsā*, or *Vedānta* aphorisms, with Kanthasivāchārya's comment. [Continued: Adhyāya I. pādas 3 and 4; Adhyāya II. pādas 1 and 2 (one pāda in each number).]—The *Karpāra-manjarī*. [A *Saffaka*, or dramatic composition in the Prākṛit dialect, by Rājasekhara; edited, with a Sanskrit translation, by Vāmanāchārya. Concluded in Nos. 74–76: Acts (*Javanikāntara*) 2–4.]—Obituary Notices (in Sanskrit) of Dharmārāma (Ceylon) and Professor Goldstücker (No. 74).—The *Vidvanmanoranjanī*, or "Rejoicer of the Mind of the Learned," a commentary on Saṅgānanda's *Vedāntasāra*, by Rāmatīrtha; edited, with an English translation, by A. E. G. and G. D. [Continued in Nos. 75–77.]—*Katipayapragṇavichāra*. [Problems and solutions, in ślokas, by Vināyakaśāstrī; Nos. 76 and 77.]—Catalogue of Benares Sanskrit Manuscripts. [Continued.]

**Philologischer Anzeiger**, Vol. IV. No. 11.—The principal works reviewed are: On National Education, by the author of *Letters on Berlin Education*. [Advocates greater prominence to Greek as compared with Latin, suppressing composition, teaching grammar by reading instead of by the learning of rules, simplifying examinations, &c. The reviewer recognises the evils to be met, especially the tendency to exercise the memory and not the judgment, but doubts the efficacy of some of the remedies proposed.]—Dr. J. Lattmann: The reform in the elementary teaching of the ancient languages brought about by the modern science of language. [Wishes to base the teaching of comparative science of language upon a German grammar, of which the kernel

shall be Middle High German: the reviewer prefers Greek, beginning with Homer.]—J. Lattmann and H. D. Müller: School Latin Grammar.—Dr. A. Dräger: Historical Syntax of the Latin language. [Recognises the great merit of the book as the first comprehensive attempt of the kind.]—H. Lutze: De Homericorum carminum ratione strophica.—Gul. Fries: De anacolutis Sophocleis, pars prior.—Roesner: Rerum Praenestinarum, pars iii.—Dr. H. Babuche: The development of the organization of the Roman army.—August Boeckh: Collected minor writings, sixth volume, viz. Academic Dissertations delivered in the years 1836–1858, in the Academy of Sciences at Berlin.

## General Literature and Art.

P.-J. Proudhon. Sa vie et sa correspondance. Par C.-A. Sainte Beuve. Michel Lévy.

THE literary world was surprised and somewhat shocked when, in 1865, the *Révue Contemporaine* published the first of the *Études* collected in the present volume. Sainte Beuve, it was well known, was the most indulgent as well as the most conscientious and penetrating of critics; but why he should go out of his way to tolerate the intolerant foe of property, God, and the romantic literature—how, not content with tolerating, he should evidently sympathize and avowedly admire,—these were indeed perplexing questions. In the work as it now appears (still unfortunately incomplete), the points of sympathy are made more evident than the grounds of admiration; it is Proudhon as a man rather than as an author that the critic aims at appreciating and vindicating, and though in his case the two characters blend more closely than usual, the positive value of his literary work is less clearly defined than is customary with Sainte Beuve. This defect might have been supplied had the life, which stops before 1848, been continued down to the date when Proudhon delivered his protest against the effeminate literature of the day in *La Justice dans la Révolution*, or discussed the question of literary copyright by the light of his peculiar views about property in general. But it is easy to see that what first attracted the attention of the eminent *feuilletonist* to the not less eminent pamphleteer was a certain versatile catholicity of mind common to both, while on a nearer acquaintance it appeared that the revolutionary economist and the romantic poet had a still deeper ground of sympathy in the scepticism which was their common salvation from the opposite dangers, charlatanism and platitude. Sainte Beuve was touched to find a politician, an agitator, like Proudhon, professing, not sound philosophy, but any philosophy, showing, not a correct critical taste, but at least a sense of the existence of taste. Proudhon, on the other hand, could not but be mollified, on the rare occasions when the two came in contact, by the complete absence of prejudice in the Imperial senator, who looked upon property as an affair of police regulation, and was not prepared to maintain that anybody had a divine right to anything, but

wished sincerely well to the many practical reforms that such a doctrine suggests.

Pierre-Joseph Proudhon was born at Besançon, in January, 1809. His father worked in a brewery, his mother was a peasant girl who had been in service; but they gave their son what education they could, and at fourteen he began to frequent the public library of the town, and astonished the librarian by sometimes asking for eight or ten books at a sitting. At nineteen he took to printing as a trade, and after making the tour of France as a journeyman, and passing through the intermediate grades of compositor and *prote*, he became a corrector for the press, and found means to learn Latin and a little Hebrew while revising the proofs of an edition of the Fathers and the Vulgate. What he learnt in this way was certainly better than nothing, and enabled him to write an Essay on Grammar, which served as a title for his election to a pension of 1,500 francs, tenable for three years, which the Academy of Besançon had to award to the most promising poor student of the place. It gave a piquancy to his later controversial writings that he was one of the few French laymen who could quote Scripture, and his habit of beginning every discussion rather "*avant la création du monde*," may have seemed to himself and the more candid of his proletarian readers, as an earnest of scientific impartiality. His occasional display of obsolete or undigested learning was never more than a harmless pedantry, not affecting the substance of his real work; but his judgment was usually so clear that we have to think of him as practically self-taught to explain the peculiarity. His intellectual sympathies were so varied that whatever subject he knew anything about interested him, and consequently found a place in the general scheme of his meditations; but as his knowledge was far from universal these subsidiary studies do not join on to the rest as harmoniously as if they had been deliberately chosen. Sainte Beuve lays some stress on this unfamiliar side of Proudhon, as a *savant* spoil, and it certainly appears, from letters to his earliest and most intimate friends, as if there had been a time when philology or metaphysics might have offered scope enough for his reforming zeal. His pension was forestalled to discharge his business debts (his partner in a printing speculation had committed suicide), and it was during the three lonely years of privation, bordering

on misery, which he spent in studying at Paris, that he seems first to have accepted as a vocation the redress of the economic wrongs of his order. In his first memoir, containing the famous definition, "Property is theft," he calls himself "chercheur de vérité, en grec skeptikos," yet just before the publication of the work he had written to a friend, "pray God I may find a publisher; it may be the salvation of the country." All through life his mental attitude remained the same. He believed there were salutary economical truths waiting to be discovered; while in the first fervour of production he believed that he had already discovered and was able to reveal them: calmer reflection or the indifference of the world would then persuade him that the revelation was still incomplete; but he never made his faith in the reality of the truths he was seeking depend on the success of his individual efforts; nearly all his outbursts of hope and pride end with a sigh of self-distrust: "Heaven forbid that I should magnify my part: I am telling my dreams." "Happy, thrice happy, they who can be satisfied with themselves!" is his answer to the taunt that he wishes to demolish everything, private property, community of goods, monarchy, democracy, God and the devil, and is not even satisfied with himself. He never troubled himself to avoid inconsistencies: to see a truth was to be obliged to tell it: if he had failed to see it before, so much the worse, but still, better late than never. Only, as he grew older and less sanguine, his discoveries and his criticism became more uniformly negative and destructive: it was still his ambition to reconstruct, but time and allies failed him. Sainte Beuve does not, of course, discuss at length the elaborate arguments by which Proudhon defends his initial paradox; probably he thought that eternal justice and reason had as little to do with the right of possession as with the right of property, and his criticism is only "il s'était logé dans la tête un *absolu* de vérité; il mé connaissait l'éternel à peu près des choses humaines et la marche boiteuse des sociétés." But this is not quite just, for Proudhon, while believing in the absolute equity of what he calls *mutualism*, never ventured to prophesy its universal acceptance, or to ignore the passions which founded and perpetuate the present anti-social order. His favourite metaphysical doctrine was of a necessary flux, rhythm, or opposition throughout the universe; the lameness of progress was an *a priori* truth, and it was certainly present to his mind when he gave Prince Napoleon the famous answer: "'Mais,' dit le prince étonné, et qui ne s'étonne pourtant pas volontiers, 'quelle société rêvez vous donc?'—'Prince,' répondit Proudhon avec son éclat mordant, 'je rêve une société où je serais guillotiné comme conservateur.'" Opposition was a law of nature, and he was its prophet; if his friends were in power they were sure to go too far (l'éternel à peu près des choses humaines) and it would then be his hard fate to oppose their errors; hence his comparative content with an established government that he was free to oppose, like the Empire, or, what he had thought more probable, Henri V.; since offences must come, and since it was his mission to call down woe upon the man through whom they came, he preferred, other things being equal, to have to denounce a Bonaparte or a Bourbon rather than Louis Blanc or Pierre Leroux. He was one of those impracticable politicians who take the crimes of an enemy as a matter of course, and are only seriously distressed by the backslidings of their own partizans. But we are anticipating 1848.

His *Mémoires sur la Propriété* contained the germ of the mutualistic theory of morality which he never actually developed into a system. He does not here seek the origin of the idea of justice in general, which the defenders of property were not likely to deny; but, taking the moral law for granted, he places its sanction in the objective characteristics

of the race, which makes a law to itself of whatever has to be done or forborne under penalty of the disintegration of society. It is admitted to be theft or dishonesty for one man to take an unfair advantage of another, and his argument is that every advantage is "unfair," because no one consents willingly to a bargain by which he is a loser; his consent can only be secured by force or fraud, constraint or deception, both of which are unjust. The only lawful property is the possession of the instruments of production, and if these are limited in extent (like land) they ought to be equally divided, even at the cost of limiting the production of some, a consequence which, it may be observed, could scarcely follow under a "mutualist" régime, though he accepts it, apparently regarding nature as a great capitalist whose wages fund is limited. Insufficient wages lead to competition amongst the labourers for a monopoly of work, which is a fresh source of inequality and misery, or rather an artificial reproduction of the natural "antinomy," or strife, between man and God. God, in his second famous paradox, "Dieu, c'est le mal," seems to stand for all the brute forces of the natural world which make the conditions of human life; but the conclusion to which all his far-fetched lines of reasoning point is simple and harmless enough: that in the battle with nature the interest of the race is one and identical, and that the community loses, while individuals cannot gain, when men, instead of uniting against the common foe, waste their strength in empty rivalry or the vain endeavour to get the better of each other. Men thought it was possible to overreach their neighbours, but this was an "erreur de compte," a simple miscalculation, though it reduced society to a state of things "où la production, enfin, était servitude, et l'échange escroquerie mutuelle." He ends by showing that when every one is bent on exacting the most he may and on giving the least he must, the *friction* of society in its contracts and exchanges will cause a positive fractional loss on every undertaking, resulting in a sensible deficit in the common wealth. Political economists may object that the friction is moral, and does not affect production, but this "erreur de compte" is amiable, especially as coming from an ex-operative, whose *livret* was full of favourable testimonials.

Proudhon's second considerable work, "Système des Contradictions Economiques, ou Philosophie de la Misère," is indispensable for the history of his opinions, but might be spared without much loss to his reputation or influence as a writer. In 1844-6 he believed himself to be accomplishing for France the work which his German friends assured him Hegel—continued by Strauss and Feuerbach—had done for Germany. A sprightly young German atheist who had come to Paris to interview and evangelize the French socialists, concluded a lecture on the neo-Hegelian philosophy "Donc l'anthropologie, c'est la métaphysique en action." "Et moi," said Proudhon, "je vais démontrer que l'économie politique, c'est la métaphysique en action." But as his political economy was ready made and circumstantial, while his metaphysics had to be evolved from conscientiously scanty premises, it was not always easy to connect his particular conclusions with the *a priori* truth of which they were supposed to be the counterpart. His "Contradictions" are a mixture of Kant's antinomies, Hegel's *Gegensatz*, and his own rooted conviction that every thing has a wrong and a right side. Besides the fundamental antagonism between man and nature, he dwells on the tendency of all things to decay as a step towards renewal. Religion is purified and elevated by the liberty of thought and criticism which finally destroys it; in the state, the principle of authority is undermined by the attempt to give it an unassailable foundation in the supremacy of the people, for the people; to be supreme,

must be free as well as absolute, which is the real meaning of his third paradox: "the true form of government is anarchy." Elsewhere he declares the government of man by man to be slavery, and it seems to have had a narrow escape of a still harder name: "Cannibalism still subsists amongst us: witness the Eucharistic sacrament and the Code Penal!" A government is by nature the "scourge of God," and he was accused, not without some reason, of trying to square the political circle, when he continued to preach revolution after explaining that the only durable revolution is one in which the masses do not become the government, and the government does not become revolutionary. He looked upon revolution as an organic process, while every government is by the nature of the case mechanical and executive; the social revolution would be accomplished whenever society had changed its mind, and the political revolution would be ripe when the people had learnt to prefer the blessings of anarchy to the delusive glories of self-government. With the same inconvenient logic, he opposed the *droit au travail* as wrong in principle, because a right against the state or the moneyed classes implied that both institutions were legitimate; while he consented to its recognition in practice as sure to be fatal, first to property and then of course to itself. In 1848 such a man could do little but, as Proudhon did, keep his hands clean, and get sent to prison as soon as possible for an attack on the coming tyrant. Without being in the least *doctrinaire*, he was too scrupulous and too logical to be a successful man of action, and on looking back he admitted as much with the melancholy impartiality peculiar to him. "J'ai appris à mes dépens qu'aux instants mêmes où je me croyais le plus libre, je n'étais encore dans le torrent des passions politiques auquel je prétendais faire obstacle, qu'un instrument de cette inintelligible Providence que je nie, que je récusé."

In 1856-7 when Proudhon was preparing his book "*La Justice dans la Révolution et dans l'Eglise*," for which he was sentenced to three years' imprisonment, he had several conversations with Sainte Beuve about the literature of the day, and the latter endeavoured, he thought at the time with some success, to bring the reformer to a more lenient view of its most eminent representatives, notably George Sand. He was soon undeceived. Proudhon was almost a fanatic in what regarded morality. The idea of duty was essential to his political theories, and if the claims of art were once admitted to compete with the claims of morality, what would become of the *point d'appui* for his economical reforms? Other more legitimate considerations had their weight as well. Sainte Beuve quotes a letter written in 1840, in which he develops in his paradoxical fashion the opinion of Fontanes, "*tous les vers sont faits*": all the correct verses that are not stupid have been written, and he was not disposed to tolerate incorrectness merely for the sake of change or in the name of liberty; art, too, had its duties, and his heresy, according to modern notions, was in supposing that its duties were ascertainable by reason, instead of by the æsthetic intuition which, on his own confession (*Du Principe de l'Art*), he lacked. Yet, it is Sainte Beuve who says so, "Proudhon eut été un fort bon et même un fin critique littéraire; il en avait l'étoffe"; and one has only to remember Lessing to know how large a share pure intellect may have in the highest class of criticism. Some of his judgments are fair, and neatly expressed. Lamartine was incapable of intellectual achievements; his *Méditations Poétiques* purely negative, a lamentation over the end of the ages of faith: "*pas ce côté funéraire ce poème se rattache à la révolution; aussi le succès fut grand et mérité*;" but this vein exhausted, the poet seems to him a "littérateur déshérité"; and of Victor Hugo, who, while hunting

subjects in mediæval Catholicism or the Mahometan East, does not see the revolution couching at his feet, he asks, "*n'est ce pas aussi un poète déshérité?*" Of course now Victor Hugo's name suggests the further doubt whether Proudhon was right in thinking the revolutionary idea a sufficient inheritance for art; his criticism remains negative, like the "idea" of the romantic literature he denounces, for though it were granted that the highest art always expresses sound moral ideas, he never defined what other elements were necessary to its existence. "Toute cette littérature érotique" seemed to him trivial as well as inartistic, and he would not admit that any treatment could make the loves of *Indiana* or *Jeanne* as fit a subject for art as the old-fashioned conflict between love and duty typified in *Chimène*. But then, unfortunately, as his own remarks on *Facelyn* prove, men's notions of duty fluctuate, and a sacrifice that is tragical to one generation is grotesque, nay, immoral, to another. The ideal of beauty may not, perhaps, be naturally more stable than that of virtue, but he does it less than justice by making it dependent on another variable quantity, because to him it appeared naturally and necessarily secondary. This is the only way of accounting for the fact that after declining to distinguish between the matter and the form in the works of such artists as George Sand and Victor Hugo, after all his tirades against licentious idealism, he ended as an apologist of the "realist" Courbet. In his secret mind he seems to have thought that Courbet's pictures were too ugly to be seductive, and accordingly he interpreted their cynicism as a backhanded tribute to the beauty of virtue. There is much clever writing and some good art-criticism in the work, one of his last, and published posthumously—which contains this curious corollary of æsthetic puritanism.

If authors had been influential enough as a class to be worth outraging, Proudhon would probably have enlivened his book *Les Majorats Littéraires* with a *sous-titre*, "Copyright is simony." Ignoring the existence of publishers, he treated the question as one between men of genius, the discoverers of truth, and the general public, which he held to be capable of apprehending all truths when fitly set before it. Works of genius being priceless, it was absurd to attempt to estimate their money value, and besides, in a "mutualist" society all kinds of work will be paid on the same scale; meanwhile, he argued, it was impossible that the same thing should be sold twice, and an intellectual creation ceases to be the exclusive property of the original owner when it has once been—for a consideration—given to the outside world. To know a thing is to have all the possession possible of its truth, and whoever has learnt it owns it as much as the first discoverer, or indeed, if he can apply his knowledge, even more. Proudhon in his zeal for equality would sometimes go so far as to denounce the tyranny of talent; a dead level of educated mediocrity did not terrify him in imagination, and he had an optimistic theory that the different capacities in society are proportioned to its wants—that one Newton is enough for many centuries, and that Newtons will certainly not be made rarer by anything that makes astronomical text-books cheap. To console the authors for any pecuniary loss his plan would inflict on them, he magnifies their office to hearts content, and suggests the example of Mahomet, who, though by no means exempt from literary vanity, derived no pecuniary profit from the Koran. In the discussions which gave rise to the *brochure* it is noticeable that Sainte Beuve was also on the side opposed to privilege.

It is to be hoped that the suggestion of his biographer will be acted on, and Proudhon's complete correspondence published whenever it can be done without offence; but we

shall still have to regret the incompleteness of the little work which has shown us two able men in a somewhat new light equally advantageous to both.

H. LAWRENNY.

**Parables and Tales.** By T. Gordon Hake. Chapman and Hall, London. 1872.

DR. HAKE has re-issued the four parables which were generally regarded as the most telling and taking portion of his former volume, which was published a year or two ago, and received, we fear, more recognition from the press than from the public, together with four new poems, of which the last is a parable. Of the four parables which appeared before the *Academy* has spoken already. "Old Souls" and the "Lily of the Valley" are reprinted either without alteration or with alterations purely verbal; they stand still to all intents as they stood in the *World's Epitaph*, which was issued for private circulation in 1866. "Deadly Nightshade" was altered for the worse before publication; and though it has been elaborately retouched for the present edition, we hardly think it has been improved. In its original form the versification was no doubt perceptibly rough and bald, and even now it has not been raised to the same high level of simple elegance as is maintained in three at least of the new poems; still, superficially, something has no doubt been gained. But the great merit of the poem as it stood in 1866 was its faithful actuality, and this has only been impaired by successive efforts at simplification and emphasis. The misery of the mother and child was more effective when we were told that it was farmed by the lodging-house keeper; and we miss the redeeming trait that from the first she gave the baby its share of the gin. Both these changes were made when the poem was first published in the volume which contained "Madeleine," since then one or two vigorous lines have been pruned away, and two weak stanzas have been added, which may be sufficiently appreciated by the first line of each—"Oh what a theme in evil dwells;" and "A theme more sad in evil dwells." The fourth parable, now called the "Poet"—in its two previous shapes the title was "Immortality"—has been recast still more thoroughly, and here, though doubtfully, we are inclined to think that the changes have been improvements. In its original form the poem was very touching; viewed as the almost undisguised confidence of the author, it expressed all the pathos of the situation of a man who, with the highest aspirations, and with lofty powers both of thought and imagination, finds that he is growing old without having made his mark. The confidence was touching because it was naive; but confidence on such a subject can hardly be naive without being querulous. In its new form the poem is more impersonal, more manly; the arrogance gains dignity by the suppression of complaint, and there is an artistic gain in the picture of the poet's communion with nature which first feeds his aspirations and then stimulates his unrest, and in the sudden revulsion to home which precedes the final solution.

Of the new poems two can hardly be said to have a definite subject. In one the author describes the daily life of a cripple who had to go to the workhouse when his mother died; in the other he describes one of the walks a blind boy used to take with his sister, making her describe everything that she saw. There is a short but complete story in "Mother and Child." A young lady leaving the opera with her lover sees a destitute mother and child crouching under the colonnade; she is haunted by the face of the child, but her lover's image takes its place, and she does not carry out her purpose of searching for them for several days. She finds

them in church, however, before it is too late, is fascinated by the beauty of the baby, detects its resemblance to her lover, and learns that the mother has been discarded for her own sake; whereupon she breaks off the marriage, and adopts the baby. "Old Morality" is perhaps the least satisfactory thing in the book. The versification halts more than elsewhere, and the story is rather obscure and not particularly interesting. So far as we can make it out it appears to be as follows:—A sexton is digging a grave for a popular and estimable squire; while he is thus engaged Old Morality comes up *incognito* and asks for his own epitaph, which naturally the sexton cannot show him. "The righteous perisheth, and no man layeth it to heart," is really more impressive as well as more intelligible.

Taking the volume as a whole it is much more satisfactory than anything the author has previously published, and we shall be curious to watch its reception by the public, though its reception will not affect our opinion of its value. Popularity is only one element in the success of a painter; it is to be regretted that it still should be almost the only element in the success of the poet. The explanation of course is simple; to say nothing of the fact that a picture only has to be sold once, it takes longer to read a poem than to look at a picture, and it is harder to recognize good work in a poem than that we do not care to read twice than in a picture that we do not care to see often. Whether people care about it or not, Dr. Hake's work is certainly very good. To illustrate again from the plastic arts, we should say that he combines at his best the feeling of Flaxman or Blake in his simpler designs with the clear, sober daylight pleasantness, the plain finish, the pathetic repose of good Dutch painting. It would be natural in some respects to compare him to Wordsworth; but Wordsworth, even when he is most deliberately homely, is more spiritual, less concrete. Wordsworth only gives us human nature as it existed among the hills and lakes of Cumberland, and in the few and early poems, where he tries to bring out the pathos of a town subject, he always conceives it with a perceptible something of rustic surprise. Perhaps it is another side of the same tendency that Wordsworth always treats common things as if they were uncommon, whereas Dr. Hake rather insists upon their commonness as a new element of their significance. Then again Wordsworth's mysticism is given off, so to speak, by a rational philosophy, which can be stated separately; Dr. Hake's mysticism is a substitute for articulate thought, and in this reminds us of Blake. Of course the mysticism of Blake is far subtler, richer, deeper, as well as wilder, but the advantage is not all on his side; there is something infantile and fragmentary about Blake's best poems; while if Dr. Hake's inspiration is more diluted, its expression is always—at least in this volume—mature and complete. Still it would be interesting to know how far the rediscovery of Blake helped Dr. Hake to form his style and obtain full possession of his talent. Blake's influence, if it existed, would certainly be a natural and sufficient explanation of the transition to the manner of *Parables and Tales* from the manner of *Poetic Lucubrations* which the same author published in 1828, with a doubtful prophecy that "the world would find" them "after many days." *Poetic Lucubrations* have a certain sincerity and depth; otherwise they produce the effect of a crabbed and unmusical continuation of Campbell, with a sort of uneasy craving to be wild and volcanic without quite knowing how.

It is obvious from what we have said of the level excellence of Dr. Hake's best poems that extracts do him less than justice; we quote the three prettiest stanzas from the "Cripple," with the warning that they are far more valuable in their place:—

"A sheep-worn walk along the brook  
The cripple loved to trace; the gush  
Of water thrall'd him as it shook  
The ragged roots of the green rush,  
Which, with its triple flowers of pink,  
Stood ripe for gathering at the brink.

"The heather bristles round the knoll,  
Where inlaid moss and leaflets blend:  
'Tis there he sits and ends his stroll,  
His crutch beside him as his friend,  
And looks upon the other bank,  
Where blue forget-me-not grows rank;

"Where purple loosestrife paints the sedge;—  
Where bryony and yellow bine,  
Locked in blush-bramble, climb the hedge,  
And white convolvulus enshrine,  
Nestled in leaves, they all appear  
Each other's flowers to nurse and rear."

There are eight illustrations besides the frontispiece by Mr. Arthur Hughes. None are wanting in grace and feeling. In the frontispiece and one or two others we seemed to trace an excess of childlike sweetness, and even a defect of manly knowledge. The starving child in the illustration to "Deadly Nightshade" is very pathetic, but the smug tradesmen in the background are a little too fit for a picture-alphabet of the very highest order. On the other hand, both the tinker and the tipsy watchman in the illustration to "Old Souls" are thoroughly good, they have exactly the combination of quaintness and power which suits the poem. There is so much grandiose in the cowering mother in the illustration to "Mother and Child"; and the stooping figure of Time is certainly impressive, though it is difficult to make out what the radiant boy seated by the bier has to do with the dead poet, and impossible to make out what Time is kissing, or how to complete the figure which seems to lie under the half-lifted pall. The elaborate cover combines a great deal of ingenious symbolism with a general effect both rich and pleasing; perhaps it is too realistic, the details strike us as too emphatic to be delicate.

G. A. SIMCOX.

**Hannibal: An Historical Drama.** By John Nichol, B.A., Oxford. Maclehose and Co., Glasgow. 1873.

It is difficult to know by what standard an historical drama ought to be tried, for history is not fruitful in really dramatic actions or catastrophes, and the historical dramatist has to compromise as he can with his story and his characters, and look for ideal completeness of effect rather than the general tone of the scenes he selects from history than to any high organic unity which it is possible to establish between them. Certainly Mr. Nichol has maintained a very high level both of elevation and energy through a play that is longer than any of Shakespeare's historical tragedies. His characters talk very vigorously, as well as very cleverly, it never occurs to us that the conversation stands still to give them time to be clever; though there are one or two long descriptive speeches, like that of Sosilus on the march of Hannibal's army through the Pyrenees, and that of Hannibal on the view of Rome, which seem as if they would be more in place in a drama constructed rather on the Greek, than on the Elizabethan model. This is not the only incongruity. Mr. Nichol is known as one of the most distinguished advocates of women's rights; but we doubt whether his clients will thank him for having shown his irrepressible interest in such questions by going out of his way to introduce a *femmelibre* in the person of Fulvia, the daughter of a Roman consul, who leaves everything to be the mistress of Hannibal, and takes the place of Calavia, a daughter of a Campanian senator, who prefers to cheat

her own lover and save her father by marrying Otacilius (whose name is spelt Otalicius throughout the play). After all, Fulvia is a puppet, like Imilce, an imaginary Spanish wife of Hannibal, and though she is more theatrically effective, the effect, such as it is, seems hardly worth purchasing at the expense of such a flagrant anachronism. Of course the ideal purpose of both episodes is to bring out Mr. Nichol's conception of the character of Hannibal, but this is hardly a sufficient justification. In fact, it would have been better to have been satisfied with presenting the great deeds of his hero, without trying to invent a great ideal for him on purpose to make him realize it. Hannibal's heroism, we suspect, was mainly of the silent order: he did not make fine speeches about his mission, or nurse fine feelings about it; he was simply a great *condottiere* at feud with Rome. The greatness he displayed during his long and, upon the whole, successful career, was of a kind to which history can do more justice than fiction. He is only lowered by scenes where he is represented as disguising himself as a spy to see if the guards can be trusted to arrest him, or as giving Mutines a dagger to perform the Happy Despatch. The climax to the play, where Hannibal swears to perform his vow to the uttermost in spite of the death of Hasdrubal, reminds us of a tragedy of Mason's, where the play goes on long after the action is over in order that the heroine may vow with adequate solemnity not to marry again. It is true that Mr. Mason had the excuse of imitating the Greeks. But we do not wish our last word to be of censure. After all, Hannibal is a very spirited and very creditable performance: if Mr. Nichol's great command of the eloquence of dramatic poetry were to be employed on a subject of more concentrated interest he might produce an admirable and lasting work.

G. A. SIMCOX.

**Histoire générale de la Musique.** Depuis les temps les plus anciens jusqu'à nos jours. Tome III<sup>me</sup>. Par F. Fétis. Paris. 1872.

In this volume, which treats of the music of ancient Greece and Italy, M. Fétis labours under the serious drawback of very imperfect knowledge of the Greek language. On p. 45 he writes the word *συνμμενον* ("conjoint," a kind of tetra-chord) *synmenon*, adding in a note, "du verbe *συνεμναι*, aller ensemble." This ignorance leads him into more than one doubtful speculation. For instance, he finds in Aristides Quintilianus a table of an ancient scale ("ancient" to a writer of the first century, A.D.) containing two octaves, the lower of which is divided into quarter-tones, the upper into semi-tones. The notes (of which a facsimile is given on p. 29) are corrupt in all the MSS.: it is plain, however, that they are those of the ordinary Greek notation. Above each is marked the number of quarter-tones (or dieses), counting from the lower end of the scale, and these numbers, which are given in the usual way, by the letters of the alphabet, are mistaken by M. Fétis for an archaic musical notation of wonderful symmetry and perfection. Some interesting but (we fear) fallacious conclusions are based upon the discovery. Again, in the chapter on the Melopœa of the Greeks, M. Fétis has given from Aristoxenus (pp. 204-207) a number of rules which refer to the succession of intervals in a musical scale, but which he takes to refer to the structure of every melody. Naturally he finds that they are "étrangères à l'objet réel de la musique," that they "tombent souvent à faux," that the ancient writers were not true musicians, &c. On the question whether the Greeks were acquainted with harmony (in the modern sense), he has a long but quite inconclusive chapter. The subject is one in which accurate interpretation is peculiarly needed. Yet there is much in the volume which shows both knowledge and ability. The

information given on the subject of the ancient musical instruments must have cost no inconsiderable labour to collect. It is greatly to be regretted that M. Fétis should have undertaken a task for which accurate philological training is an indispensable condition. As it is he has produced a work of misdirected ability, useful possibly as a quarry of materials, but wholly unfitted to hold the place of a standard work.

D. B. MONRO.

### NOTES ON LITERATURE AND ART.

A new fortnightly review, on the model of the Parisian *Revue Critique*, has been lately founded in Portugal, under the title *Bibliographia Critica da Historia e Litteratura*. The editor, S. A. Coelho, proposes to try the current literature of his own country by the strictest cosmopolitan standards, and to recommend by example and precept the results and methods of modern science and research.

The *Revue des deux Mondes* seems at last to have recovered from the disturbance in its usual placid habits produced by the war. The number for February 1 contains, besides other readable articles, part of a novel ("Méta Holdernis") in M. Victor Cherbuliez's liveliest manner; an account of the popular poetry of Central Asia, by Mme. Dora D'Istria; an unintelligent review of "Middlemarch," by M. Bentzon; M. Guizot *apropos of Madame Ricamier et ses amis*; and a notice of M. A. de Candolle's *Histoire des Sciences et des Savans depuis deux Siècles*; a work on the plan of Mr. Galton's "Hereditary Genius," containing some fresh and interesting statistics.

Recent excavations in the *Vigna Casali* on the Appian road have disclosed an interesting family sepulchre, apparently of the age of Septimius Severus, with painted walls and sarcophagi covered with mythological subjects, all in a fine state of preservation.

*Macmillan* (January) contains an interesting paper by Mr. Spalding, on "Instinct," studied chiefly in chickens and other domestic birds, and pointing to the conclusion that Mr. Herbert Spencer's theory of inherited experience meets all the facts of the case, except the popular belief, which it is hard to justify, that instinct has something peculiarly mysterious about it.

The *North American Review* (January) has an article on "Bjornson as a Dramatist," apparently written by a fellow-countryman, which may be recommended to English readers, whose knowledge of Norwegian literature is likely for some time to come to be at best second-hand.

The most brilliant event in Danish literary society this winter has been the production of Herr Ernst von der Recke's clever drama of "Bertran de Born" at the Royal Theatre of Copenhagen. The young poet has achieved great success not only on the boards, but also before the reading public.

Frederick Christian Sibbern, the most eminent of Scandinavian psychologists, has lately died at Copenhagen, in his 88th year.

*Buda Pest Review* (*Budapesti Szemle*) for January and February, 1873, begins a new series. Edited by M. Paul Gyulay (Pest Ráth). The first article in this number is from the pen of M. Salamon. It is a plea for a freer artistic and scientific handling of the existing materials of Hungarian history.

An article in the same by M. Imre on the neologisms introduced into the Hungarian language during the last hundred years, and on the errors committed in the process of innovation, points out the immense extent of the changes made, far surpassing anything of the like kind in Latin or the modern languages of Western Europe. The article is but the first instalment of a work, to which the Hungarian Academy awarded the Marczibányi prize for 1871-72.

M. Pulszky contributes to the same an account of the engraver Marc Antonio Raimundi and his school, followed by a catalogue of the 180 specimens of his work at the National Museum, of which M. Pulszky is director. We have, besides, the first part of an article entitled "Some Glances at the Progress of Natural Science," commenting on Dr. Carpenter's address to the British Association; a chapter from Vambery's *History of Bokhara*—a critique of Mr. Mill's Programme of the Land Tenure Association, questioning its conclusions; the first of a series of articles by the Manager of the National Theatre on the reorganization of that—for Hungary—important institution. The editor's review of recent Hungarian novels suffers from the extreme slightness of the subject matter. The conventional modicum of poetry, original and translated, and of fiction, with short critical notices of pictures and books, completes the number, which shows almost throughout the influence of English thought and models. Thus we have a translation of the *Saturday Review's* critique of Thomas Maitland or Mr. Buchanan's notorious article.

Some amusing parodies, which originally appeared in an American magazine, have been reprinted by Mr. Hotten, we hope with the sanction of the authors, under the title of *Diversions of the Echo Club*. The writers have not taken individual poems to burlesque, but have tried to compose semi-seriously in the manner of their models; there are no less than four imitations of Browning, all more than tolerable, a very good one of Tennyson's more prosaic idylls, one still better of Poe, on the promissory note for fifty dollars he gave to Greeley, who offered to sell the only autograph of the poet he possessed half-price. Longfellow is well done; so also, so far as we can judge, some other American poets less familiar to an European public. The authors succeed better with their own latest school—Bret Harte, Hay, Whitman, and Joaquin Miller—than with our latest, Swinburne, Morris, and D. G. Rossetti; the imitation of the last is made unrecognizable by the intrusion of weak and obvious criticism.

Gustave Ricard, one of the most distinguished of French portrait painters of the present day, died suddenly at Paris, on Friday, January 24th, at the early age of 49. M. Ricard was born at Marseilles in 1824, and made his first studies in his native town; then he established himself in Paris, and exhibited in the Salon of 1850 a head of a "Young Gipsy Girl," which attracted the attention of both artists and amateurs by the largeness of character and distinction of style which stamped it as the work of a genuine and penetrating artist. In 1852 he obtained the first medal, and in 1853 he produced his fine portrait of Wilhelmine Clauss, and the portrait of Dr. Philips. In 1855 he exhibited nine portraits and a portrait study. At the Universal Exhibition the special public of artists and connoisseurs found him justifying their high expectations, but he only received from the jury an "honourable mention." In 1857 and in 1859 he still continued to exhibit, sending successively a large number of portraits, of which many have become celebrated in the world of art. Up to this moment Ricard's works were familiar to every frequenter of the Salons; but now satisfied with the position which he had achieved, and irrevocably classed beyond and above the common line, Ricard retired wholly from public exhibitions, only reappearing last year with a portrait of M. Paul de Musset. In Germany his works were well known and highly valued, and quite recently he made a stay in this country, painting several persons more or less known in London society. M. Ricard's powers were not, however, solely devoted to portraiture; he executed for the hotel of M. Paul Demidoff a considerable decorative work of a high order of merit, and was also the author of several decorative panels for M. Lavallée. In these works, as in his portraits, M. Ricard showed the same distinguishing qualities, the same poetry of line, the same profound sobriety which gave strength and beauty to his portraits. Amongst those which have obtained the most marked success we may add to the three above mentioned his portraits of M. Anatole de la Forge, Mme. de Calonne, Mme. Sabatier, M. Arlès Dufour, M. Chenavard. It was on this last mentioned portrait that M. Ricard was engaged but a few hours before the sudden death which snatched him from the many attached

friends who held him dear, and from the assured and successful future which lay before him. We learn from the *Chronique des Arts*, to which we are indebted for much of the above, that M. Ricard was intending to make a serious and considerable exhibition of his works at Vienna, and it is to be hoped that his friends will carry out in his honour those intentions which he has left unfulfilled; such an exhibition would be of the utmost value in helping us to appreciate the true quality and rank of an artist whose refinement of character, width of view, and cultivation of mind stamped everything which he did. The *Figaro* for January 30th contains a careful article on M. Ricard by M. Albert Wolff, and the *Gazette des Beaux-Arts* promises us a full and carefully-considered notice.

The *Gazette des Beaux-Arts* for February 1 commences with the concluding article on "Les Estampes des peintres graveurs," by M. Henri Delaborde. M. Louis Courajod contributes a first article on the writing and ornamentation of the charters and diplomas in the Museum of the National Archives. M. Saint Cyr de Rayssac continues his notice of the correspondence of Henri Regnault, edited by Arthur Duparc. M. Louis Ménard gives us a study on the Graces as symbol of the social tie. M. René Ménard writes a brilliant superficial article on Portraits in the English School, which resolves itself into a discriminating criticism of Sir Joshua, Gainsborough, and Lawrence, which is however just, as far as it goes. M. Alfred Michiels continues his investigations into the origin of the German school of painting. M. Alfred Darcel, the director of the *Gobelins*, contributes a second article on the archæological movement inasmuch as it concerns the middle ages. The number is accompanied by a vigorous etching by M. Rajon after Gainsborough's portrait of Mrs. Siddons. It is a forcible, spirited, attractive piece of work of thoroughly artistic quality, only it is the quality of M. Rajon, not of Gainsborough. The vivid, sharp, acute transitions of tone do not stand in any appreciable relation to the suave refinement, and naive, sweet, harmonious quickness of the original. One might fitly say of M. Rajon's translation from Gainsborough as was said of Morghen's rendering of Leonardo's Last Supper, "*si belle de burin si fausse de caractère.*"

M. Le Gros, who is now in Rome, has left behind him a painting which will worthily represent his powers in the forthcoming exhibition of the Royal Academy. At Boulogne yearly takes place the pathetic ceremony of blessing the waters when the fishing fleet set out on their hazardous voyage. This ceremony forms the subject of the picture; the moment chosen is that when the priestly procession has approached the brink of the sea and the benediction is actually being bestowed. But the interest of the painting does not centre on this group, which is indeed seen but in the distance forming only the continuation of the snake-like curve of the composition, conducting the eye to the centre point of bright, fathomless, sun-lit sea, and there ending, just as the massive rocks on the opposite side of the composition form the solid base and point of departure. The interest of the whole centres in the two groups subtly detached from each other, and so made to carry on the circular wave of line up to the procession, which finally diverts it to the sea. These groups are composed of the wives and mothers who are praying and hoping on shore. The right-hand group face the spectator, then occurs the break, and the remainder kneel, turning their faces to the waters. But this finely felt and masterly composition is not the only charm of M. Le Gros' powerful work. The draperies are faultlessly excellent and severe, and the hands are drawn with admirable precision and sense of character; it is not until we dwell on the faces that any suggestion of adverse criticism arises in our minds. Here we feel a want of transparency, which destroys the flesh tint and conveys even into the beautiful group of the young mother and child a dash of unreality. And surely M. Le Gros, who can give us such strong, full, manly work, can give us this, so that when we see draperies and hands which stand forth in life, in character, in sobriety as grand as Holbein, we may not feel shy of lifting our eyes for fear of missing in the heads that vitality which informs every other portion of the picture. We understand that this admirable work is the property of Mrs. Eustace Smith.

M. Rudolf Lehmann has just completed a portrait of Helen Faucit (Mrs. Theodore Martin), which is in course of being

engraved by M. F. Joubert, a pupil of Messrs. Dupont and Ingres. The celebrated actress is represented standing in a balcony; she is wrapt in a white burnous (with shining and dull stripes alternating); her left arm is leaning on the balcony, the right hand holds up the folds which nearly cover the whole figure, so that only a small bit of the blue dress which it conceals is seen. Laurel-trees are in the background, and in front some oleander flowers and leaves hide part of the balcony. The picture has given great satisfaction to private friends, which augurs well for its reception by the public. M. Lehmann has also recently painted the portrait of Mr. Morgan, the well-known American banker, partner of the late Mr. Peabody, and is at present engaged on a considerable work representing the Ratification of a Concession granted by the Shah of Persia to Baron Julius de Reuter.

From time to time the leading continental engravers undertake some *chef d'œuvre* of one or other of the great Italian masters, completing in the course of years, as they may be able to apply themselves to the task, a perfect work of reproduction in their own art. Müller, Forster, Keller, and now Blanchard, have done this; the latter having just completed one of the most lovely pieces of modern line engraving of the picture by Francia of the *Virgin and Two Angels weeping over the dead Christ*. This picture, which was painted about 1495 for the Buonvisi chapel in the church of S. Frediano at Lucca, was the lunette of the altar-piece, and has always been considered one of the typical examples, as it is one of the most pathetic in sentiment, of the art called by some Italian writers *antico-moderno*, that is to say, the art just before the cinquecento, when naturalism and the classics combined to make the graces of style and execution supersede every higher motive recognized in the previous age.

With us, we are sorry to say, engraving of this kind has almost become extinct, and on this account, as well as on its own merits, this print deserves particular mention. The thorough study of a notable picture such as this, by an able artist engraving it, is itself sometimes of great importance. Two years ago or so a line engraving of similar dimensions appeared by Keller of the Sistine Madonna at Dresden, on the upper rim of which appears for the first time the rod passing from side to side of the picture on which the curtain hangs. This curtain, it will be remembered, in all previous engravings appeared on either side of the background of angels' heads as if it came simply from the top edge of the painting, whereas it was ascertained, on that great work of Raphael being taken from its frame, that several inches of the painted surface containing the rod on which the curtain hangs in front of the luminous background had been turned over and concealed by the frame. This of course was an accidental result, but the completion of elaborate line engravings such as these must be considered of the highest advantage to public taste, and the best monument to the master. We have examined this print by Blanchard after the Pietà of Francia with care, and find it worthy of being placed among the finest works of modern times. This engraver, it will be recollected, did Holman Hunt's Christ in the Temple, and in our opinion rendered it a little thin in texture, but here we see nothing of that defect; the tones of all the draperies are particularly full, and the faces of the angels rich in execution, expressing with great charm the redness of weeping and the pathos of the original. Blanchard is now employed on Alma Tadema's Vintage.

## Physical Science.

*English Botany.* Edited by J. T. Boswell Syme. 3rd edition. Vols. I.—XI. Hardwicke. 1863-1872.

THE first edition of *English Botany* appeared during the interval between 1790 and 1814, and reached when completed thirty-six volumes. Sir J. E. Smith wrote the descriptions, and the drawings were made under his supervision by James Sowerby. They were published as the plants they were made from came to hand, and consequently in no systematic order, and cryptogamic as well as flowering plants were included. Each plate was coloured by hand, and gave so much of the plant drawn from as could be represented without reduction within the compass of an octavo page. No doubt the folio size adopted by Curtis for his *Flora Londinensis*, which was by no means by the way restricted to the plants of the London district, was in many respects more satisfactory. But that work will probably always remain a fragment, while *English Botany*, if less ambitious in form, has accomplished the complete illustration of all the flowering plants indigenous to the British Isles.

The second edition was merely a reprint. The third, which is the subject of the present notice, is, except for the use made of a large number of Sowerby's old figures, an entirely new work. Contrary to what is often the case with illustrated books, it certainly owes its importance in great measure to the descriptive text. The first of the eleven published volumes appeared ten years ago, and, besides the general editing, the elaboration of the descriptions has continuously engaged Dr. Boswell Syme's attention since that time. The result is worthy of the labour spent upon it, and leaves nothing to be desired, either as regards a careful study of the materials collected by Dr. Boswell Syme himself and communicated to him by correspondents and friends, or as regards a critical appreciation of what is to be found in foreign authorities. The use which Dr. Hooker has constantly made of these volumes in collating with them the descriptions in his *Student's Flora of the British Islands* is a sufficient proof of their value.

Without the tedious process of actual counting, there is no means of ascertaining what is the number of distinct species of indigenous flowering plants which Dr. Boswell Syme has recognized. Dr. Hooker's specific standard seems to be of about the same value, and the *Student's Flora* appears to contain 1,207 species. *English Botany* includes probably therefore about the same number, and these are illustrated by 1,824 plates. This gives an average of three plates to two species, which shows that, besides the typical and most normal form, the most prominent variety in the case of half the species has been figured as well.

It is one merit of the present edition that the series of plates has been adapted to a systematic enumeration of the species. The first edition consisted of a mere haphazard collection of illustrations, copious in some places, most defective in others. Many of these have been discarded, being often inadequate, and sometimes even erroneous, especially from the confusion of closely allied plants not critically discriminated at the time the drawings were made. For this class of plants, indeed, an immense deal had been done subsequently by the attentive study of different botanists, and the beautiful figures illustrating many of them which were made by Salter for the supplement to *English Botany* have been intercalated in the present work where they were needed. New figures have also been given, and if these compare somewhat unfavourably with the work of the older hands they still serve their purpose sufficiently. If indeed an exception be made in the case of some of Salter's best plates, the whole work might, judged by a purely artistic standard,

fall into somewhat unjust discredit. But modern botanical drawings demand a peculiar kind of conventional treatment almost diagrammatic. The careless, spontaneous attitudes of living plants are far from always bringing out discriminative details of structure with the clearness required in a technical illustration. Few botanical artists can draw plants with this end in view and yet avoid, even to a moderate extent, the hardness and primness which is often distressingly unfitting. It is often melancholy to turn, by way of contrast, to the woodcut illustrations of the old herbals, especially of the sixteenth century. Then the artist was content to render, with sometimes almost audacious conventionalization, at least in matters of size and general arrangement, the general *facies* of the plant. The result is almost always felicitous, not seldom marvellously so. There was no demand or temptation to aim at anything more; discrimination was founded on clear differences of general aspect, and the artist evidently devoted study to obtain a distinct, perhaps even a slightly exaggerated, idea of what the individual character of the plant consisted. But with the progress of observation, diagnostic structural details of a more and more recondite sort have gradually taken the place of *facies*, or habit. In bringing out these into prominence the grace which belongs to individualized living forms either evaporates or is even deliberately neglected.

It would be impossible to discuss in this article in any adequate fashion the numerous matters of technical interest which suggest themselves in turning over Dr. Boswell Syme's pages. The only want which is not satisfied is the geographical distribution. There can be no doubt that the facts about our indigenous plants have never been set forth before with such completeness and accuracy. Indeed as regards all details of structure which are not merely histological this chapter of scientific work may be regarded as practically closed. At any rate, Dr. Boswell Syme's volumes are likely to be held authorities for the next century.

It is very desirable that the flora of a country should be regarded as an instrument of national education. Every naturalist worth anything at all has passed through the phase of ardent collecting. Apart from the various kinds of mental and physical enjoyment which grow out of it as a recreation, there is no other training which so well brings to the mind keenness of observation, and the power of seizing and weighing objective distinctions. It would therefore be well worth the attention of an intelligent government to preserve spots of primitive land-surface of which the vegetation was especially interesting. Some of these already owe their preservation to the protection given to game. But under these circumstances botanizing is apt to be confounded with poaching. In the future it may be hoped that a botanist studying the surviving remnants of an ancient vegetation on some one of our mountain tops may do so with all the sanction which a visit deserves to a monument, if one may so call it, of our early physical history.

At the close of the pliocene period northern Europe, including the greater portion of the British Isles, which were then connected with the continent, was covered with a continuous sheet of ice. If any fragments of an arctic vegetation held possession of spots which the ice left uninvaded, even these would be destroyed by the subsequent gradual submergence beneath the sea, which left nothing but the mountain tops exposed. The British Isles were therefore, as regards terrestrial vegetation at this period, a complete *tabula rasa*. As their surface gradually emerged, it would be stocked with animal and vegetable life from the adjoining continent, with which there is reason to suppose it was again continuous. The climate, which had been milder during the period of submersion, now again became cold; the moun-

tains were once more clothed with glaciers, though not so extensive or so confluent as before. The vegetation must have been therefore at first of the character we now know as arctic, and this would give place, as the climate ameliorated, to new northward-spreading waves of vegetation. Mountain summits in Britain, as elsewhere, preserve some fragments of this old flora, which on the continent has shrunk away towards arctic and alpine Scandinavia, and is perhaps still retreating. The Scotch fir (*Pinus sylvestris*) found in the bogs of Ireland, and at the bottom of those of Denmark, has retreated also; in Denmark it is no longer indigenous, and as a native tree survives doubtfully with ourselves. Gradually the plants of east Europe spread towards Scandinavia and the British area, to be followed in turn by a wave from the south, to which period the beech belongs. At the same time Ireland and south-western England received contributions from the western flora of Europe. The native plants of Ireland number only two-thirds of those found in Great Britain. This is at once explicable if the latter area was nearer to the common source of origin. Nor is this all: of 120 plants which are characteristically eastern as regards the British Isles only 18 reach Ireland, and but five extend to its western side. The distribution of reptiles furnishes facts with a precisely similar bearing.\*

The British flora is therefore simply an extension of the continental flora, with which it is no longer continuous in area. A question of great biological interest at once arises: What amount of change or differentiation can be detected in the severed portions of what was once a common flora? An elaborate descriptive work like the present ought to supply, as to some extent it no doubt does, the material for making the comparison. It must, however, be remembered that British botanists have tried hitherto rather to identify their "critical" plants with those of the continent than to discriminate them.

In the first place, there is no species in the British Isles which is peculiar to them. There are consequently no such marked differences, whether accounted for by the dying out of some species on the mainland or by the differentiation of others after their migration, as exist between the vegetation of the Madeiran Archipelago and the neighbouring continents. But there is reason for believing the Madeiran vegetation, which was not however derived through land extension but by other agencies, to be as old as the miocene, and compared to this the antiquity of isolation in the case of the British Isles becomes inconsiderable.

When a flora migrates it will fail necessarily to preserve its homogeneity. To begin with, the rate of migration of individual constituents will vary very greatly: some will fall out of the march altogether, and those that transfer themselves to new localities, or are transferred, will be differently affected by the change. Some it will agree with better than it does with others, and these last will go down sooner or later in the competition. The rest may either find themselves holding much the same place in their new quarters that they did before, or they may prove to be better fitted altogether for their new conditions of life than for their old ones. The optimist view of nature is dying

out; hardly anyone believes that every living thing is in the place best suited for it.

It is quite certain that some plants transferred to a new area will evidence symptoms of constitutional in response to environmental changes. And this once set up is apt to continue till amongst the continuously-varying offspring some form makes its appearance which happens to find itself better adjusted than others to its surrounding conditions, and these in the long run it will as a consequence supplant. It results from this that even on a continent a species extended over a large area and embracing on that account diverse physical conditions, will give rise to races more and more differentiated from one another centrifugally, and at the same time blending together towards the centre. Insular position prevents this blending, and brings the differentiation consequently into sharper contrast. The amount of the contrast will clearly depend on the time that has elapsed since the separation. The British flora is as a whole only of postpliocene age, though individual specific forms are of course of far greater antiquity. But the amount of diversity from the continental flora has not yet become in any one case specific. Mr. Bentham however remarks\* that the British student of brambles or roses, "transported to the south of France or to Hungary, will still find one, or perhaps two or three, forms of bramble and dog-rose with which he is familiar; but if he wishes to discriminate the thirty or forty varieties of sub-species upon which he had spent so much labour and acuteness at home, he will find that he must recommence with a series of forms and combinations of characters quite new to him. The species is still the same; the varieties are changed." To establish clearly facts of this kind shows that even what has been thought, in the case of brambles, to be a thoroughly useless study, is not after all without its biological value.

W. T. THISELTON DYER.

## Notes on Scientific Work.

### Geography.

**The Unknown Regions of the Globe.**—The unexplored regions of the world have at all times had a mysterious and enticing interest, and the desire to know what lies concealed within their borders seems at no time to have been stronger than at present. Year by year their limits are narrowing. Four vast areas which have never been traversed by civilized man stand out pre-eminently among these, and taken together constitute about a seventeenth part of the surface of the globe. Of these the greatest is in the Antarctic Region, the extent of which is about seventy-five times that of Great Britain. The second lies about the North Pole, the third is in Central Africa, and the fourth is in Western Australia. That which lies round the South Pole is almost continuous with the Antarctic circle, and can be traced out by the furthest points reached by the voyagers Cook, Bellinghausen, Weddell, Biscoe, Kemp, Balleny, d'Urville, Wilkes, Ross, and Moore from 1772 to 1845. That part of its boundary of barrier ice which lies nearest the South Pole, in lat. 78° 10' south of New Zealand, was attained by Ross in February, 1842. The unknown region of the Arctic pole is also more or less circular in form, except where it stretches southward to the vast inland-ice fields of Greenland. In the long list of "furthest points" which constitute its margin, the inroads made on the previously unknown by Gillis, Wrangell, Parry, Collinson, MacIntock, Kane, Rogers, Hayes, Payer, and Mack from 1707 till 1871 remain perhaps the most notable. No one has as yet approached nearer the North Pole than Parry, who reached the latitude of 81° 45' over ice, to northward of Spitzbergen, in July of 1827. The unexplored African area of tropical forests and great population, the most interesting of all, because it is the most promising in useful results, stretches from the furthest points explored by the Portuguese travellers of 1806, of the Hungarian Ladislaus Magyar in 1850, and of Livingstone in later years, on the south, to the points nearest the equator reached by Barth in 1855 on the north. Eastward its outline is given by points on the routes of Speke in 1862, Baker in 1864, Schweinfurth in 1870, and Livingstone in 1870-1872. On the west the limits of unknown Africa approach very closely to the coast, and, near the equator, have only been driven inland at the ex-

\* Four species in the west of Ireland have been held to point to a former connexion with North America. Of these *Sisyrinchium bermudianum* has probably been introduced; *Najas flexilis* is also found in Europe and Asia. Two do not occur elsewhere in the Old World; but *Eriocaulon septangulare* is an aquatic plant, and therefore one of a kind notorious for wide distribution by the aid of migratory birds; *spiranthes romanzoviana* cannot however be explained away; perhaps, as well as *Eriocaulon*, it may be a straggling survivor of the miocene European Flora which had a strong resemblance to that now existing in North America.

tremities of Du Chaillu's journeys of 1865 and 1866, and by the high point on the Ogowai River attained by Walker in 1866. The settled parts of the coastland of Angola give the boundary on the south-west. If it be successful, the "Livingstone-Congo" expedition, under Lieutenant Grandy, will penetrate to the very heart of the unknown space. In Australia the great unknown desert region lies west of the track explored from south to north by Stuart in 1861-62 which now marks the line of telegraphic communication across the continent. On the south it extends almost to the steep shores of the great Australian Bight; on the north, the greatest inroad on its domain was made by A. C. Gregory in 1856; westward its outline is formed by the turning-points of the journeys made by Roe, A. C. Gregory, Austin, F. Gregory, and Forrest from 1846 to the present time. The areas of these unknown regions are approximately as follow:—

	Square miles.
South Polar Area .. ..	6,800,000
North Polar .. ..	2,900,000
Central African, .. ..	1,050,000
Australian .. ..	850,000

### Chemistry.

**The Oxides of Phosphorus.**—A. Gauthier has communicated to the *Société Chimique (Revue Scientifique, 25th January, 1872, 715)* the results of his researches on these substances. When phosphorous acid acts on chloride of phosphorus at 70° a yellow body is formed, which, after it has been washed with water, is found to have the formula  $P_4H_2O$ . At 100° it is likewise formed mixed with amorphous phosphorus; at 165° to 175° the only products are amorphous phosphorus, and pyrophosphoric acid. The substance  $P_4H_2O$  is a definite compound, and does not undergo decomposition when heated to 250°; at 275° it gives off phosphuretted hydrogen, and only at 360° does the disengagement of phosphorus commence. It is readily decomposed by soda. Gauthier has since found that biniodide of phosphorus when treated with a large quantity of water produces phosphorous and hypophosphorous acids, and a new body, having the formula  $P_4H_2O$ , which readily changes into phosphorous and phosphoric acids.

**Hyoscyamine.**—The researches of Merk point to the conclusion arrived at by other observers, that hyoscyamine is not, as has usually been stated, a crystalline body. The author (*Chem. Central-blatt, 1873, No. 1, 3*) obtained it in the form of a soft mass, which, when distilled in an atmosphere of hydrogen, forms a colourless liquid, having an odour resembling that of conine. It is readily soluble in alcohol and ether, and is taken up to a considerable amount by water. On exposure to the air it soon turns yellow and then brown, becomes viscous, and is no longer soluble in ether. It has a strong alkaline reaction, completely neutralizes acids, and forms a series of salts which are easily soluble in water and difficult to obtain in crystals. The nitrate and oxalate crystallize best.

**The Flame-test for Potassium.**—When testing for potassium in the presence of a large excess of a sodium compound by examining the flame of the mixture with cobalt glass, or a solution of sulphindigotic acid, the method, as is well known, fails unless the former metal be no inconsiderable constituent. If a solution of permanganate of potassium be used in place of either of these media, the sensitiveness of the test is greatly enhanced; for instance, in the flame given by a chloride of sodium which contained 0.4 per cent. of potash converted into chloride, the presence of potassium was clearly recognized. It is possible in this way to determine potassium in a mineral, though we should fail to recognize it by means of a pocket spectroscope. According to H. B. Cornwall (*American Chemist, 2, 384*) it appears that a mixture in proper portion of alcoholic solutions of aniline blue and aniline violet when used in the prism will shut off the light emitted by both sodium and lithium compounds, and facilitate the detection of potassium in the presence of both metals.

**New Synthesis of Anthracene.**—It has been observed by W. A. Van Dorp (*Ber. Deut. Chem. Gesell., v. 20, 1071*) that benzyltoluol, prepared by Zincke's method, and having a boiling point of 275°–280°, is decomposed when passed through a tube filled with pumice at a low red heat into a solid hydrocarbon, an oily body, and hydrogen, which escapes. The liquid substance is separated from the solid by pressure, and the latter crystallized from glacial acetic acid. The slightly yellow crystalline plates melt at 213° and have the composition  $C_{14}H_{10}$ . The identity of this substance with anthracene was established by confirmatory tests by treatment with picric acid, by the conversion into anthrochinone, and by the formation of alizarine by heating the anthrochinone-sulphuric acid with potash. This process of forming anthracene is to be recommended because it readily furnishes the product in a pure state. Benzyltoluol yields about 10 per cent. of anthracene. The oil, which was mentioned among the products, yields further anthracene if passed through the tube a second time. The reaction is as follows:  $C_{14}H_{10} = C_{14}H_{10} + H_2$ .

**Epidote.**—Several papers have appeared of late respecting the formula of this mineral. Rammelsberg, after an examination of numerous

analyses, maintains that it contains no water, and has a composition represented by the formula,  $Si_2Al_2Ca_2O_8$ ; and he produces in support of this conclusion the oxygen ratios of an analysis of the beautiful crystals of epidote of Sulzbach. Tschermak, and still more recently Kenngott, on the other hand, have assigned to it the formula  $Si_2Al_2Ca_2H_2O_{10}$ . A very careful chemical examination has recently been made by E. Ludwig (*Mineralogische Mittheilungen, 1872, beft 3, 187*), of some large and pure crystals from the Sulzbach locality, and he finds his results agree with those of the last-mentioned observers. He regards the varieties of epidote as mixtures of the two isomorphous constituents,  $Si^4Al_2Ca_2H_2O_{10}$  and  $Si^4Fe_2Ca_2H_2O_{10}$ .

**Valeritrine.**—N. Ljubawin has read a further paper on the action of alcoholic ammonia on Valerianaldehyde before the Chemical Society of St. Petersburg. (*Ber. Deut. Chem. Gesell. v. 20, 1, 101.*) In addition to valeritrine there is formed a base the hydrochlorate of which crystallizes in needles, and has the formula  $C_{10}H_{15}N.HCl$ , or  $C_{10}H_{15}N.HCl$ , a clear indication that amyl alcohol took part in the formation of the new alkaloid. By the reaction a part of the aldehyde must split up into amyl alcohol and valerianic acid; this view gains support from the fact of this acid having been found among the bye-products of the action.

**Mineralogical Notices.**—In the *Jahrbuch für Mineralogie, 1872, No. viii*, the venerable Breithaupt has published a few notes bearing the above title. Nautokite occurs in small brilliant colourless crystals belonging to the tesseral system. It has the composition  $Cu_2Cl_2$ . It was found in Chili, and is associated with atacamite and cuprite. Nantokite is probably isomorphous with common salt and horn silver. Winklerite is an amorphous compact mineral, having a bluish black colour and dark brown streak. It occurs at Oria, near Montiril, in the Sierra Alhamilla. It has a very complex constitution, being probably composed of carbonates of cobalt and copper, with hydrated sesquioxide of cobalt and arseniate of lime.—In part ix. of the *Jahrbuch* is published a paper on ardenite, by A. v. Lasaulx. This new mineral, which occurs near Ottrez, in Belgium, consists of fibrous aggregates of small crystals that have no terminal faces, and much resemble cyanite. The colour is brown or bright yellow, and the cleavage very marked along two directions. The crystals are dichroic. The mineral contains silicic acid, vanadic acid (about six per cent.), alumina and sesquioxide of manganese (29.4 per cent.), as well as a few per cent. of accidental ingredients.

**Absorption of Chlorine by Charcoal.**—M. Melsens has (*Compt. rendus, 13th January, 93*) determined the quantities of this gas taken up by varieties of charcoal, and states that one kind is able in the cold to absorb nearly its own weight of chlorine. Charcoal thus charged, when placed in contact with dry hydrogen in the dark, forms hydrochloric acid, the combination being attended by a fall of temperature. In contact with water hydrochloric acid and carbonic acid are formed. The oxygen acids of chlorine, as well as organic acids, though sought for among the products of this action, were not detected.

**The Colour of Raw Silk.**—The yellow colour of silk has been found by Pfeiffer (*Arch. Pharm. [3] 1 424*) to be a more or less altered chlorophyll which has been deprived of its blue colour. From the green cocoons or the greenish raw silk he extracted unchanged chlorophyll, which by treatment with ether containing hydrochloric acid could be split up into blue and yellow constituents.

In the last part of the *Gazetta Chimica* Roster, of Florence, announces the discovery of a new organic acid in urinary calculi. Full particulars have been sent to the forthcoming part of *Liebig's Annalen*.

### Zoology.

**On the Salivary Organs of the Honey-bee.** By C. Th. v. Siebold.—At the annual agricultural meeting, held in October, 1871, at Munich, a well-known Apiarian, Hr. Mehring, exhibited a peculiar kind of honey that he named *Kunst-Honig* (artificial honey), and which he had produced by feeding his bees exclusively with malt. This honey excited great interest, and the question was raised whether this substance was real honey, and whether, consequently, the bee was able to change malt-sugar in its stomach into honey. The physiologico-chemical part of the inquiry was taken up in Liebig's laboratory by Dr. von Schneider, who, unfortunately, was prevented from carrying the investigation to the end; he arrived, however, at the conclusion that the carbo-hydrates sucrose and dextrose contained in the malt are actually changed by the bee into honey-sugar, and that Mehring's honey only differs from other honeys in the absence of the specific aroma which is imparted to them by the flowers on which the bees have been gathering. Practically, Mehring's discovery is of importance, inasmuch as the malt-food prepared by him contains not only the ingredients necessary for the life of the bee, but also those requisite for the formation of honey, and therefore it can be used with advantage in districts where flowering plants are scarce. With regard to the wax, Dr. von Schneider is of opinion that it is undoubtedly a secretion of the honey-bee, which is formed chiefly at the expense of different kinds of sugar; but he considers that the production of wax

from sugar cannot be maintained without simultaneous access to food containing nitrogen.

After the fact had been established that honey and wax are not substances found as such by the bee, but are productions which have undergone chemical change through contact with the secretions of the insect, Prof. von Siebold directed his attention to the investigation of the secreting organs, a branch of anatomy which indeed had not been entirely neglected, but which is now treated for the first time with regard to the special functions those organs appear to perform in the preparation of the products of the bee. Prof. von Siebold distinguishes three entirely distinct and very complicated systems of salivary glands, two of which (a lower and upper) are situated in the head, and the third in the anterior part of the thorax, the latter having been erroneously regarded by Fischer as a lung. Each of them has separate excretory ducts, and is distinguished by a specifically different form and organization of the vesicles secreting the saliva. Each consists of a right and left glandular mass, with right and left excretory ducts. For the detailed account of their minute structure we must refer to the paper itself, and the plate accompanying it. It may however be mentioned that this extraordinary development of the salivary organs has been observed by Prof. von Siebold in the workers only. The queen possesses only a rudiment of the lower cephalic system in the form of the two orifices of the ducts, while the ducts themselves as well as the glands are absent; and the two other systems are much less developed than in the workers. In the drones not even the orifices of the lower cephalic system could be found. (*Bienenzeitung*, 1872, No. 23.)

**Observations in Myology.** By G. M. Humphry, M.D., F.R.S. Cambridge, 1872, 8vo., pp. 192.—This is a re-issue of Prof. Humphry's valuable papers originally published in the sixth volume of the *Journal of Anatomy and Physiology*, excepting only a chapter on the myology of *Uromastix*. The collection contains a description of the muscles and nerves of *Cryptobranchus* and *Lepidosiren*, of the muscles of the dog-fish, *Ceratodus* and *Pseudopus*, and a chapter on the disposition of muscles in vertebrate animals generally.

**Buller's History of the Birds of New Zealand.**—The rapid progress of this work, of which parts 3 and 4 have been published together, will give great satisfaction to the subscribers. We are very glad to learn that in consequence of a request made by our leading ornithologists, Mr. Buller will issue a series of supplementary plates so as to include a coloured representation of every species of New Zealand bird.

**Annali del Museo Civico di Storia Naturale di Genova.** 236 pp.—The Marquis Doria published the third volume of this journal in December, 1872. It contains the following papers:—A. Paladilhe, on the new Asiatic genus *Francesia*, and on some new species of mollusks from Aden. W. Peters, amphibians from Sarawak. R. Gestro, note on some coleoptera. L. Fairmaire, on new Italian species of the genus *Adelops*. E. H. Giglioli, craniological notes on the chimpanzee. A. Morelet, notice of land and freshwater shells from Abyssinia. P. M. Ferrari, the species of *Aphidæ* hitherto found in Liguria. This volume is illustrated by 9 plates.

### Philology.

**Virgilio nel Medio Evo.** By Dominico Comparetti, Professor in the Royal University of Pisa, Leghorn. Francesco Vigo. 1872. 2 vols.

WHEN the Florentine periodical *Antologia*, made so famous by Vieusseux, after succumbing to the unfortunate political circumstances of those days, was revived in 1866 by the enterprise of some Italian patriots of high rank, under the title *Nuova Antologia*, the first number, besides contributions bearing the honoured names of the former minister Count Terenzio Mamiani, the Princess Cristina Belgiojoso, the political economist Ferrara, and others, contained at its head an essay, *Virgilio nelle tradizioni letterarie fino a Dante*, which was subsequently (vol. iv. and v.) continued under the title *Virgilio Mago*. The place assigned to the first part of this work, in an undertaking of so much importance, destined to command increasing consideration and sympathy in Italy and elsewhere, shows sufficiently the place held by the author, Prof. Comparetti, in the opinion of the public—an opinion based on his very valuable and scholarly works (cf. *Acad.* 1870, No. ix.) and his conspicuous activity in the University of Pisa. This study on Virgil contained, indeed, a very interesting and instructive representation of the after life of that poet during the middle ages, of which the first part, that relating to the literary tradition, treated of a theme either entirely new, or new at least by the exhaustive way of stating all the relationships of the subject. Comparetti's treatise, however, was only a sketch; and prolonged and comprehensive studies have at last put him in a position to represent Virgil in the light of poet, scholar, prophet, and magician, as he appeared throughout the whole of the middle ages, and to explain the development and the phases through which his celebrity has passed at different periods, as well as its nature and sources and the links connecting it with the history of European thought. By beginning his researches with the lifetime of the poet, Comparetti is enabled to penetrate deep into the characteristics of his genius, and so to discern the internal connection of these phases more clearly than would otherwise have been possible. We see, for instance, how from the first the Virgilian poetry was more felt than reasoned about, its merits came home to the heart and the imagination more than to the intellect. As the most faithful organ of national sentiment, as an artistic product standing in the most perfect harmony with the taste, the tendencies, the culture, and the requirements of the national mind, it possessed a rare and well-founded *prestige* before which the name even of the great Roman orator grew pale. Those who had attempted to ascend from this impression to its causes and to an analysis of the Virgilian poem had hitherto stopped short with its external or formal side, and considered it almost exclusively as a subject for the learned critical researches of grammarians and rhetoricians; partly because of the general tendency of all studies in this direction, and partly because the true nature of the epopee had not yet been recognized. The poetic and national value of Virgil, the mighty enthusiasm which, though universally felt, could not be defined by criticism of so narrow a scope, served to exaggerate the apparent proportions of the part which had been defined. One does not, indeed, yet perceive the idea of the poet's universal knowledge, but that of his literary universality exists already and made his authority supreme in poetry and prose, in grammar and rhetoric, that is, in the most important and characteristic elements of the culture of the time. Those who speak of him are apt to exaggerate the number and variety of his merits, and Martial was not, doubtless, expressing a merely individual

opinion when he said that if Virgil had chosen to try his skill in lyrics or the drama, he would easily have surpassed the greatest of the lyric poets or tragedians. Thus from the first the poet's fame reveals the tokens and causes of that exaggeration which we are to trace in its later phases and fuller development. For though Roman literature continued to decay notably from the time of Marcus Aurelius, Virgil still maintained his place amongst the honoured names of the classical period, though the character of his celebrity was naturally modified by the changes of the intellectual atmosphere in which it survived. The time for truly poetic creations was past for Roman literature, but rhetoric, which lives by imitation, in taking the place of poetry continued to regard Virgil as the supreme model. Only as such imitations were poetic in form rather than substance, Virgil's influence was purely formal and superficial; notwithstanding which many poets of the period enjoyed high favour and satisfied the popular taste. But how could any one capable of enthusiasm for the poetical declamation of Statius form a just estimate of the poetry of Virgil, and free his admiration for the latter from contamination by the false feeling and perverted taste which extolled his stilted and bombastic imitations? However this may be, the fame of Virgil and his misconceived traditional greatness imposed upon men's minds, and led to an almost superstitious veneration. As early as under the Antonines we meet with the *Sortes Virgilianæ*, which after being consulted by Hadrian, continued all through the middle ages to be used like Homer and the Bible for the same purpose. Alexander Severus placed the bust of Virgil with those of other heroes and writers in a special Lararium, but not before the enthusiasm of many poets had already well nigh deified him. Silius Italicus celebrated Virgil's birthday every year by a pilgrimage to his grave, which he regarded as a temple; Statius did the like; Martial speaks of the Ides of October as a festival consecrated to Virgil, as the Ides of August to Hecate, or of May to Mercury. Thus we find Virgil considered as the patron saint of poets, and amongst the numerous apotheoses of the Roman empire this one at least was dictated by a genuine feeling, though, no doubt, springing from confused sources and carried to extravagant results. The condition of Roman literature during the third and fourth centuries is well known, and if now and then, amidst the crimes and orgies of the imperial court a faint echo of the Virgilian muse might still be heard, this proved, not the existence of a true poetic sentiment, but only that the poet's popularity defied the most unfavourable ages. He was then chiefly and almost exclusively employed as a school-book for the instruction of youth, or as material for the childish exercises of adults. In the schools he was studied so diligently that it was a common thing to know him by heart from one end to the other, whence the fashion for Virgilian centos. The explanations with which the study of the poet was accompanied must naturally have had great influence upon the way in which he was regarded, so that an exhaustive critical history of the numerous commentaries on Virgil would be of great value and importance; for all through the middle ages fresh ones were constantly appearing, and as constantly varying with the vicissitudes to which they were incessantly exposed. All who left the schools of the grammarians and rhetoricians had learnt to regard Virgil as the prototype of both, the author *par excellence*, who contained within himself the ideal of knowledge and culture peculiar to each age. What fruit this seed brought forth amongst mature men and professional students we see in the *Saturnalia* of Macrobius, where Virgil is celebrated as a marvellous encyclopædic author. The way had long been prepared for Macrobius's work, both in what concerned the materials which he used

and the spirit in which he wrote. The intellectual decline, so visible in the author despite his efforts to rise above the level of his time, had begun long before, as we have seen. Composed in the last days of the old heathen world by a writer who himself still belonged to that world, the *Saturnalia* threw the clearest light upon the character of the idea entertained of the poet in the last moments of Paganism, when his name was about to be transported into the new atmosphere of mediævalism. Two other authors belonging to this period of decadence, the great grammatical luminaries Donatus and Priscian, also helped to maintain the heathen tradition, and contributed to keep the fame of Virgil alive during the centuries of barbarism. But even outside the learned and scholastic world the poet had not lost his early popularity; theatrical pieces derived from his works continued to be represented, and one of the favourite subjects was the misfortunes of Dido, which moved the spectators to tears, and were so much in vogue as to be reproduced on carpets, in painting, and in works of art of every existing kind. Public recitations were not wanting, and in the sixth century the thronging people still came to hear the *Æneid* read in the *Forum Trajanum*. As centre and summit of the literary inheritance bequeathed by the Romans, as the expression of the universal Roman feeling which survived the Empire, the name of Virgil received such a lofty and comprehensive significance as to become in Latin Europe almost synonymous with civilization. With this mission the dying heathen society passed him on to later ages; and some centuries before Dante designated Virgil *virtù somma*, Justinian had thought it necessary to place his name side by side with that of the divine Greek poet who was his *pater omnis virtutis*, upon the most durable monument of the practical wisdom of the Romans. Meanwhile grammar was still regarded as the first of the liberal arts, belonging, indeed, always to the *trivium*, and we even find a Gothic king, Atalarich, in a letter addressed to the Roman Senate, solemnly rehearsing its praises, and recommending a proper care for the maintenance of its teachers. But where grammar reigned, there also reigned Virgil as its highest authority and inseparable companion. In the middle ages Virgil and grammar were almost convertible terms. Thus when Gregory of Tours says that, in his youth, Andarchius "de operibus Virgili, legis Theodosianæ libris arteque calculi adprime eruditus est," one can only understand *de operibus Virgili* as referring to the study of grammar; and even when modern literature began to exist, and the thought of Europe began to stir along a new course, grammar, and Virgil with it, continued to occupy in popular recognition the same leading place which the above-mentioned king of the Ostrogoths had assigned to it in the sixth century. Classical antiquity survived the middle ages only by its hold upon the schoolroom. Together with Virgil, or rather as satellites of that great planet, reigned Ovid and Lucan, Horace, Juvenal, and Statius, and yet a few others, exactly in proportion to the degree of favour which they enjoyed amongst the teachers of youth. The names of these ancient authors with those of the elder grammarians were the first lesson impressed on the memory of children. When the child had become a man, and perhaps himself an author, it was impossible to efface these early reminiscences, which were kept alive by the very language in which he wrote. This is the explanation of the enormous mass of quotations from Virgil and other Pagan authors met with in Christian writers after the final extinction of Paganism and during the whole of the middle ages. Nevertheless, it was impossible for Christian feeling not to experience a certain repulsion for these representatives of Paganism, in consequence of which the same course of conduct was always pursued respecting them. The fathers

of the Church, indeed, who had written much against the heathen authors, had not ceased to make use of them for their own purposes, and this example was accurately followed all through the middle ages. These authors were carefully studied, quoted when necessary in original compositions, and even in theological controversies or biblical exegesis, yet denounced as "idoltrous dogs" whenever occasion presented itself. But if some pious scribes allowed themselves to indulge in these outbreaks, others again carried their admiration for Virgil to the point of fanaticism—e.g., Radbert, who gave his vote in chapter in Virgilian verses; the monk Probus, who had such an enthusiasm for Virgil and Cicero that his *confratres* ridiculed him, and pretended he wished to rank them amongst the saints; Bishop Rigbod of Trèves was said to know the *Æneid* better than the gospel, &c.

The extraordinary number of MSS. of Virgil which we possess is a further proof of the wide dissemination of his works in the middle ages, and of their use in schools; for one sees that many of them were evidently only transcribed for that special purpose, by the carelessness which makes them useless for criticism of the text. Meanwhile it was not only in language and style that the heathen authors were regarded by their Christian successors as masters and authorities; any passage that could be made to support a doctrine of the faith was used for that purpose without scruple, even though the natural sense might sometimes be forced, or even perverted, in the process. This was particularly the case with Virgil; for the high consideration in which he stood, as the greatest of the Latin poets, as well as on account of his morality and the extraordinary wisdom ascribed to him, led the Christian theologians to refer to him for such purposes more frequently and more confidently than to the other heathen poets, while, at the same time, they showed that he, of all the heathens, was the one who had approached most nearly to the truths of Christianity.

But, as is well known, the fourth eclogue was the chief source of his mediæval fame, as it was that which caused him to be reckoned amongst the prophets who, like David, Isaiah, &c., had foretold the coming of Christ. He appeared, accordingly, with them in the religious plays of the middle ages down to the revival of letters, and as by this means even the lowest classes were familiarized with his name, the idea of him in this new legendary shape gradually blended with the other popular conceptions of Virgil as a magician, of which we shall have to speak further on. For the rest, the ecclesiastical writers were not the first to find in Virgil's works whatever they chose to look for in them. The heathen commentators, too, were led by the prevailing taste for allegorical interpretations to apply the same method to his poems, and all the more because they failed to conceive how such a mighty sage as Virgil was supposed to be should have omitted to conceal something much deeper and more profound under the apparently simple narrative of the *Æneid*. He was not indeed used by the apologists of Paganism against the Christians, but his works were allegorized by philosophers as well as by grammarians, by Pagans as well as Christians, and the hidden mysteries discovered by both were held to refer only to points of ethics and philosophy, especially to the vicissitudes of human life in its struggles after perfection.

The loss of so many monuments of antiquity is the reason that few specimens of this mode of interpretation as we find it in Donatus, Servius, and Macrobius, have survived till our time. The most important of these is the work of Fulgentius, a Christian writer of uncertain date, who cannot, however, have lived later than the sixth century. His work, *De Continentia Virgiliana* (i.e., what is contained, or

rather hidden, in Virgil), is one of the most strange and curious productions of the Latin middle ages, and at the same time the most characteristic monument of the fame of the poet in the midst of Christian barbarism. In the pre-ambles the author declares that he shall limit his labours to the *Æneid* alone, because the *Bucolics* and the *Georgics* contain a mystic sense so profound that scarcely any human skill would be able to penetrate them entirely. But neither in this work nor in its continuation, the *Mythologicon* of the same author, is there a single word bearing upon the struggle between the two faiths. The fundamental principle of the latter, as of the *Continentia*, is purely philosophical, and aims at reconciling the ancient myths, not with Christianity, but with philosophy. It was thus brought about in the most natural way, and without interruption of the classical tradition, that the Virgil of Fulgentius, that is to say the Virgil of Christian barbarism, appealed to sympathies which were well calculated to smooth away the incompatibility between the great heathen poet and the followers of Christianity. And this type—in which we trace the mediæval conception of human reason approaching as nearly as its fallible nature, without the succour of miracles or revelation, would allow, to principles akin to those of Christianity,—this type is only a rough foreshadowing of that which we find purified and sublimated in the poetry of Dante.

The result at which we have arrived thus far is that there were many different sides to Virgil's mediæval celebrity: a philosophic-religious side, an historical side—for the splendour of the Augustan reign, the beginning of the empire, and the near approaching birth of Christ offered, taken together, the most favourable conditions under which a great literary name could be historically presented—and, lastly, a grammatical-rhetorical side. The latter is certainly the lowest and most trivial, the coarsest and most barbarous; for what is one to think of a commentator on Virgil who explains *efficiens* by *effigiem*, *imaginem*? or who reads for "*Quo te, Moeri, pedes?*" "*Quot, Emori, pedes,*" and sees in it an allusion to the four legs of a breed of very swift Saracen steeds called *Emoris*?\* Or what is to be said of another commentator who begins his explanation of the *Bucolics*: "In those days, when Julius Cæsar was at the head of the empire, Brutus Cassius ruled over the twelve communities of the Tusci; and there began a war between Cæsar and Brutus Cassius, who had with him Virgil, and Brutus was defeated by Cæsar; but not long afterwards Julius was beaten to death with stools"? Nevertheless, as has been already observed, the grammatical side of Virgil's celebrity in the middle ages was really the most important, and the one upon which the others essentially depended: as for the purely æsthetic side, it was simply not recognized at all; though if its existence had been recognized, however imperfectly, all the other substitutes for it might have been dispensed with, or would have been very differently conceived.

At the end of the first volume or part of his work, Compagetti begins to discuss the Virgil of Dante, and points out at starting that Dante's strong Italian feeling was the principal motive for the sympathy and preference which he displays for Virgil; he treats him as peculiarly a national poet, and calls him "*la nostra maggior musa,*" and "*il nostro maggior poeta.*" His Italian soul was enraptured with the *Æneid*, in which he seemed to be reading the ancient history of Italy; for Italy, as he thought,

\* This is crazy enough: yet I cannot help referring to the reading *δὴ στήλην* for *διαστήλην* (Il. i, 6), which has not failed to find an interpretation and advocates.

"Mori la vergine Camilla  
Eurialo e Turno e Niso di ferute."

His admiration for Virgil was independent of the tradition which asserted his greatness; he felt Virgil's power himself, he recognized the dependence upon him of so many other poets, which made Virgil the *onore*, the *lume* of all; he knew that to him all "*fanno onore*," and that "*di ciò fanno bene*." As a true poet he was sensible of all the perfections of Virgil's poetry; as an Italian he was proud of such a miracle of art, for both Latin and Italian were the national language of Italy, and Virgil is the *gloria dei Latini*. Still Dante's Virgil is not the real Augustan poet, but that ideal Virgil we have already described; though it was not altogether in virtue of the mediæval halo that he had selected Virgil as his guide through the nether regions. Virgil was the favourite writer, whose works supplied food for more than one of his most intimately cherished visions, but at the same time Virgil, like Beatrice, was liable to be drawn into the currents of that majestic mind, and following its course, was idealized as the disciple's nature demanded. For Dante Virgil was not merely the representative of Italian nationality and patriotism, of Italian glory and empire, but he found in the *Æneid*, interpreted after the allegorical fashion of the day, the same journey along the path of contemplation which he had taken for the subject of his own poem, according to his conception of the relations between reason and faith, and of the power of the human intellect to attain certain primary truths without the aid of revelation. Virgil shone forth from amongst the hosts of illustrious ancients, and especially from amongst the poets, as, according to mediæval ideas, the purest and most enlightened of all, while in point of time he was also the nearest to Christ, and had even prophesied of him unknowingly. Finally, from Virgil he borrowed the first idea and many details of his journey through the lower world, and throughout his great work he makes use of him more frequently than of any other author.

It is evident that with Dante's high ideas of Virgil, he must have been revolted by the legends of his magical power which abounded amongst the lower classes of Naples, and were only too readily accepted by contemporary writers. Besides this, the way in which sorcerers and astrologers are treated in his poem shows that he did not, like the populace, look upon these arts as constituting the deepest wisdom, but that, on the contrary, the wisdom of Virgil, as he conceived it, was quite incompatible with their exercise. We see thus that the Virgil of Dante, even when the latter adopts some of the ideas of his time, still belongs to him alone; and may serve, as an original conception, for contrast with another personification of the mediæval Virgil, belonging to the same century, the Virgil of *Dolopathos*. This is a romantic work, from the cycle of the *Seven Wise Masters*, proceeding from the commonplace, uncultivated mind of a monk, in which the literary idea of Virgil appears at its lowest point of approach to the vulgar popular conception; just as the Virgil of Dante belongs to the highest intellectual sphere, in which we see the decaying literary mediæval traditionalism at the point of passing into the living classical feeling of the renaissance. In *Dolopathos* Virgil is represented as he must necessarily appear to the common scholastic conception when viewed in the light of fantastic romance, though we need not ascribe to that work a popular origin independent of the schools. He appears as the great master of all secular wisdom; his only fault is that he is a heathen, but he is as little of one as it was possible to be before Christ; nothing is wanting to him but a knowledge of the unity of God; he is of pure morals, and a great philosopher, no one is more famous than he, or more honoured by

Augustus; kings and emperors bowed before his words; he was the "*clerc*" *par excellence*, the greatest poet, and the most learned of men. In this travestied personage it is easy to recognize the Virgil of the mediæval schools and grammarians, of the text-books of the seven liberal arts. The first part of the work before us ends with the Virgil of the *Divina Commedia*, and of the *Dolopathos*, in which we see the summary of all that goes before. They represent the two extremes of Virgil's mediæval celebrity: the noble idea of a rare and powerful mind, and the trivial idea of a vulgar mind combined with romantic elements; they belong to different tendencies, and are both distinct from the scholastic conception which was their common source, though one exceeded it as much in loftiness and dignity as the other fell short in poverty and coarseness. After Dante we come to the revival of letters and the beginning of modern thought, both of which lie beyond the limits of the present inquiry; while the Virgil of *Dolopathos*, by the introduction of a romantic element, leads the way to a study of the poet's fame in a different region from that already handled, and so brings us to the second part of the work.

The subject of the second part of Professor Comparetti's work is Virgil as a *magician*—a character which was seldom ascribed to those ancient sages, amongst whom, as we have seen, Virgil was reckoned, and then only momentarily or in consequence of a confusion of names; for though every magician, according to the notions of the middle ages, was a wise man, not every wise man was a magician. No other ancient sage has been made the subject of a legend so circumstantial and complete as that of the sorcerer Virgil. Such a legend could only arise if a special popular idea of Virgil existed quite independently of literature, and, in fact, a closer investigation shows clearly that the conception of Virgil as sorcerer and thaumaturge was originally derived from the people, though it was subsequently absorbed in the literary tradition, with which it had some points of kindred. The "people" in this case was the Italian people. And here it may be observed that there is often a foundation of ancient historic or mythological facts for the legends which took their rise in Italy; still more commonly they are suggested by ancient monuments, though sometimes nothing but the names preserved in them are ancient, for many of the great Roman names lingered in the memory after they had been dissociated from the facts with which history connected them, though they might still be associated with some characteristic trait; but whatever historical circumstances might survive, could only do so in a form adapted to the comprehension of men and women of the populace, like her of whom Dante says:—

" . . . Traendo alla rocca la chioma  
Favoleggiava colla sua famiglia  
De' Trojani, e di Fiesole e di Roma."

A most striking proof of what has just been asserted is afforded by the legend of Virgil which took its rise in Naples, and thence spread over the whole of European literature, but most rapidly and vigorously out of Italy. In that country the legend was essentially a popular product, free from all poetical or literary admixture, a popular belief, superstitious in character, and founded partly upon local reminiscences of Virgil's long residence at Naples, and partly on the presence and celebrity of his tomb in that city. The superstitions related to places, images, and monuments in Naples, to which it was supposed that Virgil had imparted a talismanic potency. These legends remained peculiar to the people of Naples without finding any poetical or artistic expression; in the other parts of Italy they were little

known or considered, but foreign visitors to Naples collected them, and, thus transferred from their native plebeian to cultivated and literary spheres, they made their appearance simultaneously in popular romance and in learned Latin works. In both spheres the idea of Virgil as a typical sage was already of such a character as to secure an easy acceptance for the legends. And so it came to pass that, after the twelfth century, that is to say, after the rise of the so-called romantic fiction, in prose and verse, we encounter a new, and, what is more, a popular phase of Virgilian renown, with various springs and accretions, and a history peculiar to itself. We do not call this phase popular because it continued strange to learning and the learned, for our knowledge of its history is in great part derived from works by the latter class; but because, as has been said, it arose amongst the people, and was nourished upon popular ideas. Amongst the earlier works bearing on the investigation, three are of importance from the fulness of their details, all written in Latin, and intended for the higher classes of society; that by Konrad of Querfurt, Chancellor of the Emperor Henry VI., and his viceregent in Naples and Sicily, afterwards Bishop of Hildesheim; another by Gervasius of Tilbury, an Englishman by birth, Professor of Law at the University of Bologna, and a Marshal of the Empire at Arles under Otho IV.; and lastly that of Alexander Neckam, foster-brother of Richard Cœur-de-Lion, Professor at the University of Paris, and Abbot of the Augustinian monastery at Cirencester. The two first not only give us the earliest account of the Virgilian legends, which they gathered in Naples itself from popular tradition, but they point to a Neapolitan origin for the tradition, which is confirmed from other independent sources. Konrad mentions the legends in a letter from Sicily addressed to his friend, the prior of a monastery at Hildesheim, in 1194, in which he describes his impressions of Italian travel. This letter is a very remarkable monument of the spirit in which even educated foreigners at that time visited Italy. Their imagination was heated, and they had formed at a distance such a phantastic conception of the country whose name was so glorious, that even a near vision of the reality failed to shake their beliefs. A thousand strange tales which they had heard before, a thousand classical reminiscences of half-forgotten school lore, crowded on the visitor's brain, who seemed, as in an enchanted land, to see very different and much greater things than he really did see. In no other way can one explain the gross absurdities which the worthy Chancellor writes down with quite distracting gravity and good faith. What had he not seen in Southern Italy! Olympus, Parnassus, the Hippokrene, and he is delighted to find that all these wonders are contained within the German dominion. After passing with profound awe between Scylla and Charybdis he finds—Heaven knows where!—the island of Scyrus, where Thetis kept Achilles concealed, and he was made happy in Taormina by the sight of the Minotaur's labyrinth, and by introduction to the Saracens, a people possessing the same enviable faculty as St. Paul, of killing snakes with their spittle. He fulfilled punctually his master's commands to raze the walls of Naples, and yet did not hesitate about accepting the belief then prevailing amongst the inhabitants of the city, that these very walls had been erected by Virgil, who had provided a palladium for their defence, to wit, a small model (*imago*) of the town, contained in a narrow-necked flask. Konrad ought certainly to have been the first to doubt the efficacy of the palladium; but there is no shaking the faith of those determined to believe, and accordingly Konrad says that the failure of the talisman was accounted for by the presence of a slight rift in the flask, which the Germans also succeeded in discovering on close

inspection. This might be taken for a jest but for the whole tone of the letter, and the numerous other absurdities recorded with equal seriousness. We now come to Gervasius of Tilbury, who, in his *Otia Imperialia*, written for the amusement of the Emperor Otho IV., has given us as it were an encyclopædia of fables and usages of all kinds, forming a most valuable authority for the history of popular superstitions. Many of his Virgilian legends are substantially identical with those related by Konrad, though there is the degree of variation in points of detail usually met with in oral traditions such as they both relied upon. Others again are peculiar to himself, and transport us at once to Naples at the end of the twelfth century, when the legends still throve in their original home amongst the people. As for Alexander Neckam, but little is known of his life (1157-1217), and it cannot be positively decided whether he ever visited Naples or not. The date of his work, *De naturis rerum*, is doubtful, but certain indications allow us to infer that it must have been written between 1180-1190, whence it follows that, at that time, the Virgilian legends were known in Europe independently of the writings of Konrad and Gervasius, and must have been disseminated by earlier visitors to the city. For what concerns the substance of these legends, we have already seen that in their earliest form Virgil appears as the protector of Naples, while the wonders ascribed to him consist chiefly of talismans; since, apart from the traditions of antiquity and the importation into Europe of ideas pertaining to the Semitic races, the belief in talismans had gathered strength in the south of Italy during the Byzantine rule. In fact, we find in Constantinople itself objects of the same kind ascribed to Apollonius of Tyana as in Naples to Virgil, and connected in the same way with particular monuments of the city; and the same was the case in Paris at the time of Gregory of Tours. If one connects with the above legends another given by John of Salisbury, who, according to his own statement in 1160, had crossed the Alps ten times, and travelled through the south of Italy, and consequently knew Naples well, one may form an idea of the original form of the Virgil legend as it existed amongst the Neapolitan populace. The leading idea seems to have been that Virgil not only resided in that city, but that he was either its actual ruler, or at least had, by means of his relations with the court, a considerable share in its government; and that in either case he never failed to display an earnest zeal for the public welfare. There were, moreover, various ancient and mediæval monuments to which the vulgar, there as elsewhere, ascribed marvellous and mystical properties, and we have already seen what a halo of profound wisdom seemed to the learned of the middle ages to encircle the name of Virgil, so that the people of Naples were naturally led by the same idea to ascribe all such talismans to him. But as this idea was universal, the question arises how the legend relating to him came to have an exclusively Neapolitan origin; and this is the last and simplest expression to which the problem of the legend can be reduced. To begin with, the existence of Virgil's tomb at Naples is one of the principal facts which explain the survival of his name amongst the traditions of the Neapolitan people. Whatever we may think of the authenticity of the site pointed out now or in the middle ages as the resting-place of the poet, there can be no doubt that Virgil both wished to be and actually was interred at Naples, "via Puteolana intra lapidem secundum," as his biography in Donatus says. This notice is apparently derived from Suetonius' (A.D. 98-138) Life of Virgil, and is confirmed by other statements, which show that Virgil's tomb became one of the chief glories of Naples, and attracted visitors almost in the same way as a favourite

temple of some god, as we have already seen with Silius Italicus and Statius. In the fifth century Sidonius Apollinaris still regards the grave of Virgil as the glory of Naples. It is evident that the people of the city, witnessing the veneration in which the poet was held, could not fail to keep at least his name in memory. For the earlier part of the middle ages, it is true, we have no direct information on the subject; but one may fairly conclude from the great and increasing reputation of the poet that the Neapolitans must have been accustomed for centuries to hear the name of Virgil repeated and his grave asked for by every visitor of any degree of cultivation. We see from the same biography how familiar the people of Naples were with his mild, modest expression of countenance, so that they were accustomed from it to call him *Parthenias*. Comparetti also thinks that his name was kept in remembrance partly by plots of ground in the neighbourhood of Naples which had belonged to him, like the *Garden of Virgil* on the present Monte Vergine, of which Gervasius tells that all manner of medicinal herbs grew there. The name of this hill has undergone several transformations, for it was called in the middle ages *Mons Virginis*, *Mons Virginum*, and *Mons Virgilianus*. The latter designation, like the *Garden of Virgil*, is most easily explained by the supposition that the poet had really owned a piece of ground there; and it is certainly clear from Aulus Gellius (ii. 213, cf. Serv. *Æn.* vii., 740) that scarcely 150 years after Virgil's death people spoke of his possessions in that neighbourhood. The circumstances we have mentioned prove sufficiently that Virgil's fame survived in Neapolitan folk-lore even during the ages in which history and written records have nothing to tell us of the mode of its preservation. By way of final result we ascertain that there were two distinct elements in the oldest form of the Neapolitan Virgil legend: first, the name of Virgil connected with the belief in his especial affection for the city of Naples; and secondly, the belief in certain talismans attributed to him. The first element is exclusively Neapolitan, and goes back, perhaps, to the time when he lived at Naples and chose to be buried there; the second is not originally peculiar to Naples, and is undoubtedly of later date than the first. The two became amalgamated together because the mediæval idea of Virgil's infinite wisdom, combined with the old recollection of his preference for Naples, caused him to be credited with works of wonder that were supposed to be of public utility as well as creations of secret and profound knowledge. In this oldest form of the legend Virgil never appears in a ludicrous light, and all thought of magic or diabolical arts is rigorously excluded. Gervasius of Tilbury attributes Virgil's talismans to the *ars mathematica*, i.e. astrology; and Boccaccio, who lived later, when the Virgil legend had already begun to change its character, did not think he was injuring the fame of the poet he honoured so highly by making him accomplish his wonders by the help of "*strologia*," as he had been a "*solenissimo strologo*," an idea which we find expressed before by Servius and others. But here arises the further question, when the belief in these talismans arose in Naples, and when it became associated with the name of Virgil. And to this our written authorities can give no reply, for it would be folly to suppose that ideas of the kind were no older than the earliest mention of them which we chance to find in John of Salisbury. Everyone who has studied legendary lore knows how slowly and secretly the mythology of different nations forms itself, and then all at once rises to the surface amongst writers of books—a process which leaves it probable that part, and probably the greater part, never reaches us at all, but falls a prey to oblivion. We need not therefore be surprised at not meeting with the Virgil legends before the

twelfth century, for it was exactly in that century that light began to break upon the inner life of the Italian towns, and therefore of Naples as well, which then began to issue from its state of isolation, and formed a part of the new kingdom founded by Roger, while it increased so much in importance and consideration as to become ere long the capital of an influential state.

We turn now to the later legends respecting Virgil, in which he appears as a *magician*, and here it must be observed that the first and most radical change in the structure of legends always begins when they leave the soil from which they sprang, especially when they owe their existence to some local, historical, or traditional motive. In strange countries they cannot of course be understood as easily as in their native home, and so they are exposed to be misunderstood and metamorphosed. Thus while the primitive Virgil legend could not tell of diabolical arts because the feeling of the Neapolitans forbade the belief that their town owed its supposed advantages to such arts, or that Virgil, its protector, could have practised them, these objections lost their weight when the legend spread from Naples all over Europe. Besides this, it was only a step from the *ars mathematica* or *astrologica* to the Black Art or necromancy, and if for the above reasons the Neapolitans declined to take that step, there was nothing to prevent Virgil, who was a heathen to begin with, from being made in other countries to share the fate of Gerbert and other famous students of mathematics and astrology, who were transformed into magicians and necromancers. We need not be surprised at finding the Virgil legend, as soon as it became known beyond Naples, promptly utilized by those *jongleurs*, those *cantores Francigenarum*, who were at once poets, ballad singers, and mountebanks, and had no higher object than to amuse the people in public places by their arts as well as by their *Contes* and *Fabliaux*, and so to charm the money from their pockets; accordingly, so early as the beginning of the thirteenth century we find in the *fabliaux* versions of the Virgil legend which are not to be met with in Naples. Nor did it fare differently amongst men of letters. As with Neckam, who, as we have seen, was probably never at Naples, so with Helinand, the author of a Latin chronicle, who also wrote a little before Gervasius, but cannot either have visited Naples; while from the French poets, popular and courtly, their German imitators of the thirteenth century—Wolfram of Eschenbach, Frauenlob, Enenkel, the author of the *Wartburgkrieg*, &c.—learnt to know Virgil as a magician and necromancer, and thus helped to spread his fame amongst the people as well as amongst the learned. And here it is noticeable that the relations between Virgil and Naples, characteristic of the oldest Virgil legends, always occupied a very subordinate place in the learned tradition; for Virgil was one of the most conspicuous figures in the ancient literary world, and his name therefore could not be separated from the natural centre of the latter; the legendary Virgil could not exist apart from the legendary Rome. How could it be believed that he whose magic arts had done such wonders for the benefit of Naples, should have done nothing for Rome, *Roma aurea*, *Roma caput mundi*, Rome whose origin he had made immortal in immortal verse? This omission in the Neapolitan legends had to be supplied, and was supplied as soon as they began to spread over Europe. We find accordingly in Neckam and Helinand a Roman Virgil legend, that of the *Salvatio Romæ*, which refers to the capitol, and it must be admitted that the invention of such legends did not call for any great exercise of the imagination. For as in Naples the belief in certain miraculous objects existed independently of Virgil's name, which was arbitrarily associated with them by the people, things of

the same kind had long existed in Rome, and it was easy to give them a godfather in the mode already practised by the Neapolitans. The only difference was that the Neapolitan legends acquired a Virgilian cast in Naples and at the hand of the Neapolitan people, while the Virgil legends of Rome were invented outside the city, in more literary fashion, and certainly in imitation of those of Naples. The above-named legend of the *Salvatio Romæ* is the earliest instance connecting Virgil with Rome; for though we know that Virgil possessed a house on the Esquilinum, he does not seem usually to have resided in Rome, and even had he done so, the fact would have left less vivid recollections than at Naples; for the inhabitants of the capital of the greatest empire in the world were too much accustomed to striking personalities and remarkable things of all kinds to retain so deep and lasting an impression of Virgil's personality, though they might be able to recognize and acknowledge his value. Accordingly when we find in Rome this or that monument connected with the name of Virgil we are not to see in this the result of a living tradition respecting him preserved by the Roman people, but only a reflection of the Neapolitan legend transplanted to Rome. When the latter had, in the thirteenth century, made its way into all parts of Europe, it became more and more developed, in all sorts of versified works, especially some French ones which were much read; such as the *Image du Monde*, the *Roman des Sept Sages*, the *Clémades*, as also in the German rhyming chronicle of Enenkel (1250); and in the fourteenth century *Renart Contrefait*, the *Viglier des Histoires romaines*, a translation of the *Gesta Romanorum*, &c., &c. In all these works Rome was naturally the chief scene of Virgil's exploits; for even when the Neapolitan legends were retained, they were sometimes so far altered as to be transferred to Rome, while the number of those peculiar to Rome increased. And at this point it was natural to transfer to Virgil, whose transformation into a magician was already complete, the stories told of eminent personages whose destinies resembled his own, so, for instance, the Gerbert legend which tended the more to be confounded with the Virgilian, as many well-known authors had related the one as well as the other. The Sibyl legend must also be noticed here on account of its relation to Virgil. At the time to which the magical part of the Virgil legend belongs, there was a widely-spread belief that the Sibyl had prophesied the coming of Christ; it originated amongst the Apologists, and had then, after the twelfth century, been introduced by ecclesiastical writers to the religious world, and took firm root even amongst the laity. Now as the prophecy in the fourth eclogue of Virgil, which was applied to Christ, was familiar to the whole religious world in the middle ages, the popularity of the Sibyl was transferred to his account, and this the more easily, as he was already popular in other ways. Sermons, especially about Christmas time, gave frequent occasion to couple his name with that of the Sibyl; and in Christian art the two were often placed side by side, or else the passage of the eclogue was added to paintings of the Sibyl, and lastly, in more than one religious mystery-play amongst other characters Virgil and the Sibyl appeared together. Hence and through many other circumstances it came to pass that the original conception of Virgil as a prophet of Christ passed through several phases, and finally connected itself with one of the legends respecting him, which related how Virgil became a magician, or procured the book from which he learnt magic art; though the same legend is to be found in other versions without any reference to this prophecy. The legend of Virgil's skill in magic elaborated itself more and more, and penetrated further and further into all Latin and German countries; it was familiar to every writer, and it was the more certain to grow that the

proverb "On ne prête qu'aux riches" holds good also of romantic legends.

A more abstract expression of the idea formed of the magician Virgil may be found in a curious Latin book, which does not, indeed, contain any Virgil legends, but is connected with him by the name which the author assumes, and by the nature of the things contained in the work. It bears the title *Virgilii Cordubensis philosophia*, and this Cordovan Virgil is ostensibly an Arabian philosopher whose work was translated into Latin at Toledo in 1290. The author, however, was certainly no Arab, and knew very little of Arabian matters, or he would never have believed that an Arabian philosopher could be called Virgil, much less have mentioned Seneca, Averroes, Avicenna, and Algazel as his contemporaries at Cordova. He is a charlatan who wished to attract consideration by taking the name of Virgil and the character of an Arab sage. With rare impudence he relates at the beginning of his book how the most learned men from all quarters of the globe, who met together at Toledo to discuss the most difficult problems, used to appeal to him because they knew how vast was the knowledge of all secret and abstruse subjects which he had attained to by means of the science, called by others *necromantia*, but by him *refulgentia*. The Latinity of the book swarms with the grossest blunders; the philosophical idea is a gigantic hodge-podge of rabbinical and Christian doctrines, amongst others that of a triune God. Of Virgil there is nothing but the name, and yet one sees from the whole nature of the work that the author's reason for assuming it lay in the ideal conception of Virgil the magician; just as a similar conception of Virgil's relation to the study of grammar led the no less mad grammarian Maro Virgilius of Toulouse (perhaps sixth century) to assume the same name. This correspondence between the results produced in two totally different phases of the Virgilian name, is one of the most remarkable facts in the history of that name, which has not only, in the course of its varying fortunes, undergone the influence of many changes in the world of thought, but also resumes them so vividly in itself that it has become their symbol and representative. The legend, however, did not spare Virgil a single trait belonging to the popular conception of a magician and adept in the Black Art, for when once he had been accepted in this character, and the legendary nucleus of which it was the development had become familiar to all, everything else followed as a matter of course, so that, at last, his legend, instead of being a simple register of miraculous works associated with his name, came to contain a series of incidents portraying his personality and presenting the elements of a biography. To these elements must be added another part that may be called sporadic, and consists of narratives to which the name of Virgil is seldom attached, and which are not included in collections bearing on his magical exploits; his name seems rather to have been added arbitrarily by some editor or compiler from association of ideas, without the incident being of any importance or recurring anywhere else. This is especially the case in the *Gesta Romanorum*. There is one more side wanting to complete the legendary form of Virgil, for it was impossible that such a familiar favourite in the world of romance should always, in spite of the fame of his actions, have avoided coming in contact with the fair sex. And the legend is far from being deficient in this particular, where the omission would certainly have been abnormal. The spirit in which the subject is treated may be guessed by anyone who considers that notwithstanding a few pure pictures presented by hagiography and Christian legend, notwithstanding the incense liberally offered to women in romances, tournaments, and courts of love, the female sex has never been more

shamefully abused, ridiculed, and degraded than was the case during the middle ages in the works of grave theologians, as well as in poetry and on the stage. An incredible number of trivial and obscene stories and anecdotes dragged it through the mire, and, what is scarcely credible at the present day, figured not only in the repertory of the ballad singer who aimed at raising a laugh in open market-places, but in that of the preacher as well, who would relate them from the pulpit, under the pretext, it is true, of some moral to be drawn from them, but really often only with the same motive as the other mountebanks. Anyone who is acquainted with these storehouses of illustration will understand Dante's wrath as he exclaims :—

"Ora si va con motti e con iscede  
A predicare, e pur che ben si rida  
Gonfia il cappuccio, e più non si richiede."

All the earlier part of the Virgil legend, so far as it relates to women, is in a spirit harmonizing with this degraded view of the female sex. Of the many well-known versions of this class of incident it will be sufficient to allude briefly to three : one in which Virgil makes an assignation with a lady by night, and was to be drawn up to her window in a basket, instead of which she leaves him suspended half way till the morning, so that he saw himself exposed to the ridicule of all Rome, and in consequence executed frightful vengeance on her (a farcical incident of which Bulwer has made use in *Pelham*, of course with omission of the latter part); the story of the *Bocca della Verità*, in which a faithless wife artfully clears herself from guilt without direct falsehood; and lastly, the incident only given in the early English book on Virgil, in which he makes some women believe by glamour that they are passing through water, which causes them to hold up their clothes rather higher than was needful—a practical jest which is mentioned here chiefly because it seems to me, like other Virgil legends, to be derived from India (cf. Polier, *Mythologie des Indous*, ii. 40-42). If we return to the general character of these legends we see that, with the exception of those taken down by Konrad and Gervasius at Naples, they were nearly all first applied to Virgil out of Italy, and found little acceptance amongst Italian writers. The most important Neapolitan record bearing on the Virgil legend is the *Cronica di Partenope* by Bartolomeo Caraccalo dicto Carafa, cavaliere di Napoli, which goes down to the year 1382, and, as the author himself says, is a compilation from different chronicles, a character which it preserves even in what relates to Virgil, for though himself a Neapolitan, the author does not restrict himself to the traditions still current in his native place, but incorporates everything bearing on his subject in Gervasius and a certain Alexander, both of whom he quotes. If by the latter he means Alexander Neckam, he can only have read his work *De naturis rerum* in a mutilated and interpolated MS., or in extracts by some other author, or in some imperfect and incorrect version. Besides a few additions conceived in the same spirit as the rest, we find the legend substantially the same in the fourteenth as in the twelfth century. Nothing diabolical is ever attributed to Virgil; on the contrary, the author always speaks of him with the greatest reverence, and is never tired of calling him "esimio poeta," while there is not the slightest allusion to his gallant adventures. In lower Italy the Neapolitan legends seem to have been nearly as well known as in Naples; but in the rest of the country they spread slowly, at least until the fourteenth century, when the national and the foreign element became likewise fused, partly as a consequence of the relations which are well known to have existed at that time between the literature of Italy and the rest of Europe.

At Rome too, as has been said, the name of Virgil was in the first instance only connected with separate spots or monuments, such as the *Casa di Virgilio* (the Temple of Jupiter Pluvius), the *Torre di Virgilio* (the Meta sudans), the *Scuola di Virgilio* (the Septizonium), and if we connect these names with the report of the annoyances to which Petrarch was exposed at the Roman court on account of his Virgilian studies, we may reasonably conjecture that at that time the charge of magic in its worst sense was held to blot the fair fame of the poet in Rome. But this idea did not arise there earlier than elsewhere, for while the MSS. of the *Mirabilia Urbis Romæ* (the guide-book of the mediæval traveller or tourist at Rome) belonging to the twelfth century contain no notice of Virgil's name, in the thirteenth century the Viminal hill is mentioned as the place "from whence Virgil, having made himself invisible, departed to Naples from his prison." The same circumstance is mentioned in the Mantuan rhymed chronicle of Bonaventura Aliprando, composed in 1414. We must take this occasion of pointing out that, of the three towns associated with Virgil's life, Naples was the one in which he left the most lively impressions, while Mantua, where he was born, but seems seldom to have resided, never produced any fanciful reminiscences of his person. Of course, Mantua did not forget, in the middle ages, that it was the poet's birth-place, and some localities in the neighbourhood bore his name, or otherwise commemorated his existence; but these were, rightly or wrongly, connected with real events or circumstances in Virgil's life, and excluded any notion of miraculous powers. Aliprando's chronicle, moreover, shows, by its primitive style and the absurdities heaped together in it, that if Mantua had had any peculiar Virgil legends, the author was the very man to have retailed them conscientiously, if they had come to his knowledge; but we find nothing of the sort. Speaking generally, the Virgil legend never took the same proportions in Italy as in other countries; we hear only, as it were, a faint echo of the ample narratives which, beyond the Alps, trace out his character as a sorcerer and a dealer in all the devil's arts. It is the more intelligible that these legends failed to thrive in Italy if we consider that there, just at this time, classical studies were beginning to revive; and in proportion as the ancient authors began to be studied with methodical earnestness and their real character ascertained, the traditional admiration, with its artificial or legendary adjuncts, of which they had been the objects during the middle ages, naturally tended to disappear. In Italy, where the torch of such studies was first relighted, the Virgil legend burnt its wings and had to keep aloof so that it could only flutter timidly about, protected with great pains by superstition and burlesque. We come now to the last phase through which the Virgil legend passed outside Italy. This consisted naturally in a kind of synthesis of all its predecessors, of which it, at the same time, gave the final result. The legends in point are collected together into a circumstantial biography in the Liège Chronicle of Jean d'Outremeuse, called *Myreur des Histors*, a compilation from writers of various dates down to the end of the fourth century. The life of Virgil is mixed up with other narratives which from time to time interrupt the chronological order, yet it is easy to consider it as a separate work which the author afterwards divided and introduced at different points in his chronicle; it is in several respects a curious composition. The author has amplified or developed the old materials before him, but he has kept the historical Virgil as much at a distance as possible; and this although Aliprando and others had made use of the notices of Virgil given by Donatus, and even Jean d'Outremeuse had some knowledge of the poet's

own works and the earlier accounts of his life. The scene of Virgil's exploits is still, according to him, Rome and Naples; but he was not of Italian origin, but the son of Gorgilius, King of Bugia, in Lybia. Setting forth in search of adventures, he comes to the country of the Latins, whose king, the uncle of Julius Cæsar, tells him so much about Rome that he wished to go there, and finally did so. This sample may suffice, as we have no space here to enter further upon this farrago of fantastic absurdities, though to do so might not have been entirely without interest, and only observe that Jean d'Outremeuse cannot have had any influence on the life of the legend, because, though he brought all the scattered anecdotes of Virgil together and worked them up into a coherent whole, the result was concealed from public notice in an obscure and voluminous chronicle. In fact the book on Virgil which was most popular and most widely known in Europe after the sixteenth century, has few stories in common with the version of Jean d'Outremeuse, and possesses quite a different character. It is easy to see that, it had its origin in France, and that after the invention of printing. Its title is *Les faits merveilleux de Virgille*. In consequence of its popularity it was translated into English, Dutch, and Icelandic, the translations containing few departures from the original. The idea of Virgil as a Christian prophet, which is so elaborately developed in the Liège chronicle, is entirely wanting in the popular version, and so are many of the other wonders which the chronicler had gathered together from every direction. On the other hand, some parts of the legend are much more freely handled.

Here closes the long list of the strange and various vicissitudes of Virgil's fame, down to the end of the middle ages. After the sixteenth century the Virgilian legend disappears, and the memory of it is only kept alive by students; for the power of credulity tottered and fell before the rising light, the irresistible advance of reason and criticism, before the philosophy of experience which prescribed the only true road to a knowledge of truth. After the middle ages the Virgil legend was only kept alive by oral tradition in its native home in Naples and Sicily, and there, too, it is now extinct. A young Neapolitan scholar, a diligent student of folk-lore, has assured Comparetti that he has never met with any traces of it, though the latter believes himself to have discovered something of the kind amongst the people in the vicinity of the Grotto of Pozzuoli and in other places in the south of Italy; while the following love song was heard not long since by a friend of Comparetti, sung by a peasant girl near Lecce:—

"Diu! ci tanissi l'arte da Vargiliu!  
'Nnati le porte to'nducia lu mare,  
Ca da li pisci me facia pupillu,  
'Mmienzu le riti to' enia 'ncappare;  
Ca di l'acelli mę facia cardillu,  
'Mmienzu lu piettu to' lu nitu a fare;  
E suttu l'ombra de li to' capilli  
Enia de menzugurnu a rrepusare."

(Dio! ch'avessi l'arte di Virgilio! Innanzi le porte tue condurrei il mare. Perché tra i pesci mi farei un pesciolino.—In mezzo alle reti tue andrei incappare.—Tra gli uccelli mi farei un cardellino.—In mezzo al tuo petto il nido a fare.—E sotto l'ombra dei tuoi capelli—Andrei di mezzo giorno a riposare.)

Here ends the second section and volume of the work before us, which examines with exhaustive learning every side of the subject to which it is devoted. It has only been possible here to indicate shortly its principal results, without dwelling on details, such as the particular actions and prodigies ascribed to Virgil as a magician, the origin of which is in each case carefully investigated by the author. But enough must have been said to prove the scientific

value and the interesting character of the whole. We must not omit to mention that the author has reprinted at the end of his second part all the original passages in Latin, Italian, French, and German writers which refer to Virgil as a magician, and are either of importance for the subject or not easily accessible (as for instance the whole of the popular French book, *Les faits merveilleux de Virgille*), and for this, too, we must be grateful. If the treatment is sometimes more diffuse than might have been wished, and the author has not always avoided digressions and repetitions, these are but slight blemishes in comparison with the solid merits of the work.

FELIX LIEBRECHT.

### Intelligence.

Dr. O. Donner has published, at Helsingfors, a very modest but complete history of Finnish philology, with a bibliographical summary. An account of it is given by M. Sayous in our excellent contemporary, the *Revue Critique*, for January 18th.

### Contents of the Journals.

*Zeitschrift der deutsch. morg. Gesellschaft.* Vol. xxvi. Nos. 3 and 4.—Himyaritic inscriptions explained by F. Praetorius; with fac-similes—Indian medicine; Caraka; by R. Roth. [Translated extracts.] Contributions to the explanation of the Avesta, by Hübschmann. From Dschâm's love songs, by F. Rückert. Decipherment and explanation of the Armenian cuneiform inscriptions of Van and the neighbourhood, by A. D. Mordtmann. [Ingenious and exhaustive, but unsatisfactory. It is clear that the explanation of the inscriptions cannot be sought for in Armenian or any other Aryan dialect. But the paper is an indispensable foundation for future researches. The mutilated inscription I. is written in Assyrian, not Armenian as Dr. M. assumes.] Towards the explanation of the Avesta, by F. Spiegel. [Answer to Roth.] On the latest Moabitish discoveries; account of journey by L. Weser, of Jerusalem. On the Saptacatakam of Hâla, by A. Weber. Himyaritic contributions by F. Praetorius. Hebrew etymologies; by G. M. Redslob. On the verb *קָרַח*, by Dr. Zunz.

Linguistic matters from Muhammedan mystic literature, by I. Goldziher. New Moabitish discoveries and riddles; third report, by K. Schlottmann. Linguistic remarks on Wright's Apocryphal Acts, by Dr. Geiger. Notices and correspondence. Notes of the Oriental MSS. of the Mediceo-Laurentian library at Florence, by Fausto Lasinio. [Corrections of Assemani and Biscioni.] The poet Niculo, by Siegf. Goldschmidt. More about alphabetic and acrostich hymns of Ephrem, by G. Bickell. Reply to Dr. Schrader, by J. Oppert. [On the question whether the list of Assyrian eponyms is complete or not, and whether the chronology of the Books of Kings can be maintained.] Extracts from letters of Drs. Schlottmann, Magnus, and Harkavy. [Rödiger agrees with Schlottmann as to the genuineness of the Moabite inscriptions explained by the latter.] Jäschke's *Handwörterbuch der tibet. Sprache*, rev. by Schlagintweit. Thorbecke's edition of Hariri's *Durrat-al-Gawwâs*, rev. by Socin. Martin's *Œuvres grammaticales de Bar-Hebraeus*, rev. by Nöldeke.

*Philologischer Anzeiger.*—Vol. iv. Parts IX. and X. The most important works noticed are:—Corpus Inscriptionum Latinarum. Vol. v. p. 1., ed. Th. Mommsen.—*Skerlo*, Bemerkungen über den Gebrauch von *δῆν* in Homer. [Attempts to distinguish the Act and Mid. senses.]—*H. Duntzer*, Kirchhoff, Köchly, und die Odyssee.—*H. Thiele*, Prolegomena ad hymnum in Venerem homericum iv. [Gives a very probable view of the date and local associations of the poem.]—*H. Berger*, Die geographischen Fragmente des Hipparch. [Lays the foundation of a correct estimate of the relation of Hipparchus to Eratosthenes and Strabo.]—*T. Mommsen*, Bemerkungen zum 1. Buch der Satyren des Horaz.—*Cornelius Tacitus*, a *C. Nipperdeio* recognitus. P. 1.—*C. Bücher*, Quaestionum Amphictyoniarum specimen.—Lucianus Samosatensis. *Fr. Fritzsche* recensuit.—*Jul. Sommerbrodt*, Lucianea.—*Procksch*, Gebrauch der Nebensätze bei Cæsar.—*Ad. Franz*, M. Aurelius Cassiodorus.—*Gerb. von Rath*, Ein Ausflug nach Calabrien. [Many illustrations or traces of classical antiquity.]

*Curtius' Studien zur Griechischen und Lateinischen Grammatik* (Hirzel) v. 2. opens with a lengthy article "De titulorum ionicorum dialecto." Brugman's discussion of the physiology of the letter *r* in the Indo-European languages is highly instructive as far as it goes. The article "De sonorum affectionibus quæ percipiuntur in dialecto Neo-Locria," by a young Locrian of the name Chalkiopoulos, is a valuable contribution to our knowledge of modern Greek, though his notions of comparative philology are rather crude. The writer on Roman proper names in *a* is wrong in thinking that the old Irish *corpimagas* goes with Latin names in *a* and not with the masculines in

us. Prof. Hadley's paper on Greek accentuation, though published before, still deserves to be pointed out as containing the newest and most rational account of the subject ever given; possibly in a generation or two his views may find their way even into the most conservative of our public schools. The editor republishes a paper of his own on aoristic forms discovered in Latin: among others the following are pointed out in early Latin:—tago, tagam, tagit, attigas fuat, attulat.

### Chief Assistant in the Observatory, Cape of

GOOD HOPE. An open Competition for one situation will be held in London on the 18th March next, and following days. A Preliminary Examination will be held in London, Edinburgh, and Dublin, on Tuesday, 11th March. Candidates must be between 18 and 25 years of age. Application for the necessary form should be made at once to the Secretary, Civil Service Commission, Cannon Row, London, S.W.

Just Published, crown 8vo., boards, 6s.

### The Churches: a History and an Argument.

By HENRY DUNN.

"Mr. HENRY DUNN in this, his last work, has carried the idea of Protestantism, as purely individual Christianity, nearer to complete logical development than any previous writer. He maintains that the Christian Societies we find in the New Testament, though divinely organized, were provisional, and lost their *raison d'être* when inspired men had disappeared, and the inspired writings had been collected. Since then all associations between Christians exist only *jure humano*, and are most useful when we recognize that they are optional. . . . The writer has a refinement and distinction of mind which are often the fruit of sustained and solitary earnestness, and these make what he says not unworthy of attentive consideration."—*The Academy*, Sept. 1st.

### General Literature and Art.

*Madame Récamier et les Amis de sa Jeunesse.* Par l'auteur des *Souvenirs de Mme. Récamier.* Michel Lévy. 1872.

THIRTEEN years ago, when Mme. Lenormant, the niece and adopted daughter of Mme. Récamier, published two volumes of *Souvenirs et Correspondances tirés des Papiers de Mme. Récamier*, there were still amongst the living some who had felt the power of her strange fascination, and many with whom the tradition of her sway was fresh. M. Guizot, who then tried (in the *Revue des deux Mondes*) de faire comprendre cette personne si belle et si rare, plus rare encore que belle, and who now is almost the only survivor of those whose names meet us in the present volume, might not unnaturally doubt whether a generation which knew not Juliette would have any interest to spare for these last gleanings from her *Correspondance intime*. This volume, however, shows us a side of Madame Récamier's character which, though not exactly new, gives a new explanation of her unparalleled social power. In 1812 she spoke of being forgotten by her friends, and the Comtesse de Boigne, one of the earliest and most constant amongst them, writes in answer: "Je crois votre crainte mal fondée. Vous êtes la personne la moins oubliée, et ce n'est pas parce que vous êtes bonne, douce, facile.....ce qui vous rend si séduisante, c'est votre bonté. Peut-être suis-je la seule qui ait osé vous le dire; il paraît si bizarre de louer la bonté de la plus jolie femme de l'Europe!.....c'est parce que vous êtes bonne que vous avez fait tourner tant de têtes et désespéré tant de malheureux; ils ne s'en doutent pas, mais c'est pourtant vrai." The letters which Mme. Lenormant has at length made up her mind to publish fully confirm this view. Mme. Récamier was "bonne"—fundamentally kind—to old and young, rich and poor, ministers and exiles, to men, women, and children, to the septuagenarian Châteaubriand, to the boy Ampère, to the little niece whose happiness was to be her consolation; and all repaid her disinterested friendship with a devoted attachment almost too absorbing and passionate to bear the same name. If she started on a journey alone her friend's uneasiness was calmed by imagining her at once "l'idole des postillons, et la meilleure amie des maitresses d'auberge;" and it would not have

occurred to any of the privileged circle of l'Abbaye-au-Bois to smile, except sympathetically, when J. J. Ampère, newly admitted to the society, and nineteen, falls on his knees exclaiming, "Ah! ce n'est pas pour elle!" when Madame Récamier (at forty-three) gave him a gentle hint not to fall in love with her niece: they had all *passé par là*. No coquette ever carried the art of pleasing to a higher point of perfection; but except perhaps in her very earliest social triumphs, Madame Récamier aimed at pleasing, not from vanity, not to satisfy her own affections, but out of pure charity and philanthropy; and for this reason it seems ungracious, and even in questionable taste, to speculate, as her countrymen are fond of doing, whether she ever actually experienced "ce sentiment passionné, exclusif, incomparable, qui s'appelle l'amour, et qu'elle a inspiré à tant de gens." A professional philanthropist learns to know human nature too well to have illusions or disenchantments, except about the species; and from these, with their attendant melancholy, Mme. Récamier was not exempt.

The present volume is divided into three parts, of which only the last appears too long. In the first, we have the letters to and from Mme. Récamier and her most intimate friends, written in the first twenty years of the century. The editress thinks it necessary to apologize for the use of Christian names throughout the correspondence. All her life Mme. Récamier was *Juliette* to her intimates, and at this time Camille (Jordan), Mathieu (de Montmorency), Adèle (de Boigne), Benjamin (Constant), Prosper (de Barante), with a few others of the same coterie, agree in dropping all formalities of style, titles, &c. Men afterwards famous were the better for the habit (if would have done Châteaubriand good to be plain François for a space), and it was protected from abuse by the instinctive exclusiveness of a picked society: it may have been merely a reminiscence of the fashions of the revolution, and a protest against the revival of courtly forms by the Consul-General, but the effect was undoubtedly pleasant. Mme. Récamier's letters, for instance, to "cher Camille" are generally short, not eloquent, not brilliant, containing no news, no scandal, not so much as a *bon mot*; if they had been numerous it would have been rash to publish them; but as simple statements of friendly affection or sympathy, varying with the circumstances of the writer and the person so unaffectedly addressed, and

always marked by the most perfect tact, they do more than M. Guizot's analysis to explain the nature of her almost unique talent, if indeed genius would not be a more fitting word for it. We have no exact equivalent for the idiom *facile à vivre*, as Dr. Johnson's "clubbable" would lose its force wherever the *salon* was an institution; but Mme. Récamier had undoubtedly the genius of living: social life, viewed absolutely, apart from the opinions, the employments, the minor affections (Mme. Récamier never lost a friend through marriage) of its members; the exchange of entirely personal sentiments, of what may be called secondary convictions, the elaboration of a running commentary on the less grateful realities of existence, an enchanted shadow or reflection, like the Lady of Shalott's, of the outer world—this was Madame Récamier's kingdom, and her grateful subjects wondered that she was not satisfied with ruling it. The expressions of discouragement which fell from her occasionally in society, which it was against her principles to sadden even when least cheerful herself, are the rule rather than the exception in her confidential letters to the "*chère enfant de mon cœur*," for whom she tries to plan a happier if a less brilliant destiny than her own. If ambition had been her ruling passion it would be easy to account for her discontent as the satiety of conquest, the craving for new worlds of admirers. M. Guizot (in 1857) thought that she might have been happy if Châteaubriand had been some one else, and she had known him earlier in life; other critics meet the difficulty by insinuating that her heart was cold, and that women are made for love, not friendship. But it must have been a warm, and indeed an insatiable, heart that could not be satisfied with Ballanche's life-long devotion, Mathieu de Montmorency's grave affection, Ampère's faithful worship, and such adoration as the hero of *Memoires d'outre Tombe* had to spare for any heroine at all; to say nothing of the crowds of lesser admirers whose passion might wear out in a quarter of a century or less. Madame Récamier was a very clever, as well as a very pretty and a very charming woman, and it is possible that the void, the something wanting of which she was dimly conscious, whenever not pre-occupied with an exacting friendship, was intellectual rather than moral. Though banished on political grounds by Napoleon, she can scarcely be said to have had any political principles, except personal dignity and fidelity to friends whatever their way of thinking. Though perfectly intelligent and ready to sympathize with whatever study was occupying her courtiers, she was so far from any natural literary bent that Lemontey could write to her, when banished from Paris: "*J'en veux à tous ces imbéciles de profession qui font des livres, de n'avoir pas mis au jour un seul ouvrage que jé puisse vous envoyer avec la certitude qu'il vous intéresserait.*" Even in friendship she was not a fanatic, and her judgment was never clouded by her affections. All these were so many conditions of her social success. As a political enthusiast, an *esprit fort*, or a *cœur sensible*, her empire would have been limited to a fraction of society, instead of including all its most brilliant elements. But social distinction does not seem to have been a passion with her, and though she spent her life in commanding it, it did not supply her with the absorbing interest which she might have found in pursuits more or less unfavourable to its attainment. In fact, she was probably the victim of her genius; it was her destiny to *tenir salon*, and wherever she was, in an hotel at Paris, in her "cell" at l'Abbaye au Bois, in the meanest country *auberge*, a few magic touches, and the mere fact of her presence, turned those present into a perfect *société*, which, having met once, was sure to wish to meet again. But while Madame Récamier charmed all the world, who was to charm Madame Récamier?

Like other and greater geniuses, she did not always find the consciousness, nor even the exercise, of her powers sufficient for happiness.

The second part of the book is taken up with Mme. Lenormant's recollections of her aunt, and the letters exchanged during their short absences or after the former's marriage. It was an education of a thousand, for the child was allowed in the famous *salon* from the first, while her studies were looked after by all the *amis de la maison*. She tells an amusing story of the weekly themes she used to write for Mme. de Genlis, and how one day having lost her way in a sentence, Lemontey came to her aid and finished it; when the theme came back corrected, a marginal note, "*cette phrase manque de jeunesse*," testified to the acuteness of the *ne plus ultra* of governesses. The third part, relating to Madame Récamier's intercourse with J. J. Ampère, appears disproportionately long, because Ampère is already sufficiently well known from other sources, and few of his friend's letters seem to have been preserved. The absence of letters to or from Ballanche is explained by their being reserved for publication in a new and complete edition of the works of that writer, who is much admired by the very few who read him. EDITH SIMCOX

(H. Lawrenny).

Ewald's Scottish Woman at Tjele. [*Den Skotske Kvinde paa Tjele. Livsbilled fra Reformationstiden af H. F. Ewald.*] Copenhagen: Høgel.

A GENUINE picture of the customs and household life of a country is always a hundredfold more valuable than the cursory notes of a mere tourist. Consequently when a foreign novelist who is really national succeeds in attracting attention away from the fatherland, when, that is, the individuality of the writer is strong enough to enforce respect, he is sure of appreciation in all communities where there is largeness of sympathy and breadth of vision. The works of Frederika Bremer and Tourgenieff have taught us here in England more about life in Sweden and Russia than many sensational books of travel could do, and it is just when these authors are most national that they are most delightful. Without claiming for Ewald a place beside the distinguished names just quoted, we may safely say that he is the most individual and characteristic romancist that Denmark has produced. It is noticeable that in Denmark, where they do so many things well, they do not tell a story very forcibly. The novelists *in posse* find a readier field for their talents on the boards of the very well sustained and enterprising theatres. Ewald's name is not quite unknown over here; his first important book, *Valdemar Krones Ungdomshistorie*, had some success in England when it appeared in translation, in 1867, as *Waldemar Krone's Youth*.

Between *Valdemar Krone* and the book before us lies a goodly series of romances, all scenes from Jutland and Zealand, and all lingering lovingly over the features of sober middle-class life in Denmark, all picturesque, quiet, and tender. To enter fully into the charm of such a book as the *Scottish Woman at Tjele* one must have been in Denmark and among the Danes, and know their country a little. One is transported to the desolate lakes in Jutland, where the water reflects all the silent beauty of the great beech woods, broken only by the wild duck leading her troop of ducklings, or the sudden whirr of the white egret from the reeds upon the shore; and again, one is treading the vast flat sands of the western islands, watching the foam and curl of the long white waves, and picking shells and amber from the shore; and yet again one is assisting at some queer ceremony of bygone times at an old baronial hall,

deep in the blowing woods. And the characters are like the landscapes that surround them, they are fresh and pure and vigorous, lads blue-eyed and yellow-bearded, and lassies flaxen-haired and rosy, even as one may see to-day in any Zealand village.

The *Scottish Woman at Tjele* is a story of more than 300 years ago. It deals with the time of struggle between the new Reformed faith and the old effete Popery. Denmark was in a condition of anarchy. Frederick I. was just dead, and his son and successor, Christian, was not only not crowned king, but not even in possession of the country; the Hanse Cities were raising the banner of the imprisoned king, Christian II., and the clouds that afterwards fell in rain of blood were closing over the land. Meanwhile the Protestant religion was fighting a bloodless war against the old faith, and popular feeling was already half upon its side. The story turns upon the condition of Mistress Mogens, a Scotch woman, of the family of the Grahames, who had married a Danish nobleman, Mogens, in Scotland, and come out to live with him at Tjele, his estate in Jutland, near Viborg. In the process of years her husband becomes weary and jealous of her, and slights her publicly, and an old scandal, which whispers that they have never been married at all, is carefully cultivated by all the relatives to whose interest it would be to oust her and her two children. The peasants, who consider that she has the power of witchcraft, and look upon her with suspicion, call her always the Scotch Woman, and hence the name of the book. It is impossible to give a sketch of the plot in our narrow limits; it is exceedingly well conceived and sustained, and depicts the sorrows and shames of the poor alien woman, scorned and dishonoured in her own house, and the injuries which the suspicion works for her two children, a boy and girl of proud and noble natures, and more brilliant impulses than most of their companions. A very fine sketch is that of a young Reformed noble, who is betrothed to Margaret, the Scotch Woman's daughter. At last the honour of the family is cleared, and the various love-threads are disentangled and drawn duly together at the end. But to most non-Danish readers the great value of the book will consist more in its antiquarian and historical details than in the mere story. The time was perhaps the most important, though not the most showy, in the history of the people. The independence of Denmark, the very coherence of its component parts, hung in the balance; a touch might have decided against prosperity. All the great political, social, and religious struggles of Danish thought of the time are lucidly and powerfully sketched in this book; and, on the other hand, the detail of life and custom, the *minutiae* of architecture, and ornament, and dress, are given with gusto and manifest fidelity. Ewald has the picturesque manner of a painter in describing; his scenes remind one of the works of that excellent Danish artist, Exner, whose pictures, unfortunately, are little known out of Scandinavia; there is the same warm colour, soberness of sentiment, and untiring accuracy of detail.

Herman Frederik Ewald was born at Copenhagen in 1821, but it was not till 1859 that his first great work appeared. Thackeray was hardly so old when *Vanity Fair* was published. From a quiet and happy home in the south of Jutland the unknown novelist sent *Valdemar Krones Ungdom*, and its success was as sudden and lasting in the little reading world of Denmark as that of *Vanity Fair* was in our wider arena at home. The warm reception of the first book encouraged Ewald to continue, and as he has been too wise to damage his reputation by hasty writing, but has gained every year in polish and force, he has met with the reward that is due, and reigns now quite undisputed

as the first of Danish novelists. *Valdemar Krone*, the least mature of his works, found favour amongst us in a translation; it is greatly to be wished that some one with the time to spare would give us a translation of *Den Skotske Kvinde paa Tjele*. It is sadly wanting in bigamy and murder, but it contains fresh and healthy elements that some of us may consider quite as precious as these.

EDMUND W. GOSSE.

## LORD LITTMASS AND LORD LYTTON.

To the Editor of the ACADEMY.

SIR,—The writer of your notice of Lord Lytton (February 1) is not alone, I find, in supposing that the character of "Lord Littmass" in *Higher Law* was intended as a sketch of the great novelist. Will you allow me, as author of the book referred to, to say that, while I agree most heartily in reprobating personalities, and abhor the ruffianly excesses in that direction of a certain portion of the press, I had no intention whatever of being personal in the sketch in question. If there be any coincidence such as that alleged, I am truly sorry for it, and not least for the sake of a writer whom I have ever held in high esteem, and whom I should be sorry to have to rank so low in the moral scale as my "Lord Littmass." But I assure you positively that any coincidence is purely accidental. The name was based solely upon the chemical test-paper called *litmus*; and the character, which was designed to represent one whose actual life would not stand being judged by the test of his own written principles, was built up step by step with reference to nothing but the requirements of the situation and consistency with itself. Such coincidences may, if you please, constitute a "curiosity of literature;" but even so, there is a yet further coincidence and curiosity in the fact that both the real and the imaginary characters died suddenly, and pen in hand. I trust that the impossibility of there being any design in this latter coincidence will help to acquit me of a like design in the former.—I am, yours obediently,

THE AUTHOR OF "HIGHER LAW."

Perhaps Lord Lytton's paper on Literary Clairvoyance, in *Caxtoniana*, may suggest a solution of such a problem as these "coincidences" seem to involve.

## NOTES ON LITERATURE AND ART.

Mr. Gerald Massey writes to us to complain that Mr. Symonds in reviewing Herr Krauss' translation of Shakespeare's Sonnets, leads readers to suppose that Mr. Massey has identified H. W. in the dedication with W. H., whereas the latter has written 700 pages to prove the difference of Henry Wriothlesley and William Herbert. We regret that we cannot print Mr. Massey's letter in full—but we are glad to receive a reply from Mr. Symonds, apologizing for his unintentional inaccuracy on this point, which arose from his having read Mr. Massey's book a long time ago, and not at present possessing a copy of it.

The French Government has resolved not to take any share in the London International Exhibition of the present year, wishing to reserve all its resources for the "grand solennité autriehienne."

The first concert of the Wagner Society took place, on the 19th February, at Hanover Square Rooms, before a large and enthusiastic audience, amongst whom were many of the musical celebrities. The aim of these concerts is to familiarize the English public with the works of Wagner preparatory to the performance next year of the Nibelungen Tetralogy at Bayreuth, and so to encourage the English to lend their support to that extensive enterprise. The orchestra was conducted by Mr. Dannreuther, to whose credit it should be said that he succeeded in satisfying, after but a single general rehearsal, the intellectual and technical requirements of compositions in great measure new, and at the same time enormously difficult. The rendering

was all but perfect, and in spite of the smallness and unfavourable conditions of a concert room, compared favourably with the stage representation of the "Flying Dutchman" at Drury Lane in 1870. At every moment one felt the want of scenery and dramatic action to bring out the full effect, although there was of course some compensating advantage in engaging the attention of an English public by purely musical means. The single point which we would recommend to the attention of the distinguished conductor is whether there was sufficient repose in the opening bars of the introduction to "Lohengrin," and in the first appearance of the Graal motive. The only vocalist Herr Franz Diener, who has been selected by Wagner to take the part of Siegfried next year, met with a most favourable reception, and his rendering of the "Liebeslied" from the "Walküre" was encored. He has a beautiful tenor voice and an essentially dramatic style of declamation, though we occasionally missed the smoothness and freedom from guttural intonation which is so rare even amongst the best representatives of the German school of singing.

The programme, which was intended to indicate the gradual development of Wagner's peculiar genius, will be repeated at the next concert. This is an exceedingly sensible arrangement for those who desire to study Wagner. Upon the whole we may say that the new music seems at last thoroughly to have taken hold of an English audience; and we have no doubt that the success that we wish the movement will be realized. The tickets of the succeeding concerts will be reduced to the ordinary price.

The Hungarians who claim Albert Dürer as a countryman appeal in evidence to the arms used by the painter, and known through his portraits, which are the same (a gate, *ajtó*, with steep roof and open doors) as those borne by the noble family "Ajtósi-Ajtós." Dürer's father, it is argued, must have prided himself on his extraction to continue the use of arms after sinking to the condition of a workman.

The papers mention the discovery at Athens, near the Temple of Jupiter, of two fine but headless statues of Æsculapius and Hygeia, ascribed to the age of Hadrian.

The new number of the *Archæologische Zeitung* (N. S. V., pt. 3, p. 72) contains a short article by Professor E. Curtius on the sculptured drum of a column from the Temple of Diana at Ephesus, and now in the British Museum. From so high a quarter we would naturally expect some new light on two points which have caused much perplexity among those to whom it is the custom to turn in the first instance for explanations in matters of this kind. These points are, the meaning of the subject represented on the drum and the exact merits of the sculpture. As regards the subject, however, the learned Professor neither attempts to explain it as a whole nor recognizes with any degree of confidence the individual figures, always excepting the Hermes, about whom it is impossible to disagree. The winged youth on the left, who has had so many names since his arrival here, and none more plausible, as we think, than that of *Thanatos*, as proposed by a writer in the *Saturday Review*, may represent, according to Curtius, *Agon*, a kindred figure to Eros. But Agon has not hitherto been found wearing a sword, and that is precisely where the difficulty occurs in all the interpretations that have been suggested except that of *Thanatos*. On the merits of the sculpture we are told little beyond this, that the figure of Hermes resembles in style the work of Lysippos, and that the sculpture generally is not unworthy of the school of Scopas. On this point, however, we are less impatient, as some further discoveries have lately been made by Mr. Wood, which, it is said, will contribute very valuable assistance in determining the position of these Ephesian sculptures relative to the other surviving monuments of Greek art. The principal interest of the article lies in the historical sketch which it gives of how the learned have blundered over the interpretation of the words *columnæ coelatae una a Scopæ*.

Dr. O. Eisenmann, in an article in the *Beiblatt zur Zeitschrift für bildende Kunst*, calls the attention of his readers to certain little red marks about the size and shape of wafers

that they may have noticed on many of the pictures in the old Pinakothek at Munich. He had the curiosity to ask what these marks meant, and found to his surprise that they pointed out those pictures that were to be rescued first in case of a fire, those, in fact, which were considered most valuable. This seems a useful precaution that might well be adopted in other galleries, but Dr. Eisenmann expresses great indignation at the way in which the protecting providence that watches over the Munich pictures has directed its operations. Many of the elect he considers are scarcely worthy of being saved, whilst some that are consigned to the flames deserve a better fate. Of course such an exercise of predestinating power demands the utmost knowledge and judgment, and the fiat should only be issued by a body of well qualified judges; but it does not seem a foolish notion that some recognized order of salvation should be followed in the event of a fire at a large picture gallery.

We hear that an international exhibition of the works of the old art of the Netherlands is projected, to be held at Brussels in 1874. Special exhibitions of this kind are most valuable to the art student as bringing together all the more important works of a master or a period. This one, no doubt, will have especial interest from the fact that recent researches have thrown much new light on the history and work of the old masters of the Netherlands, whose painting will form the chief portion of the exhibition. Several English picture owners, the Queen among the number, have promised to contribute.

The *Zeitschrift für bildende Kunst* of February 14, opens with a long article on the Bethnal Green Museum, by G. Gutenberg. Only the paintings of the Italian school are noticed in it, for the article is not finished, but will be continued in other numbers. The critic points out that the charming Madonna and Child ascribed to Leonardo da Vinci, but whose history the catalogue is "too discreet" to give, is probably a painting that was formerly in the collection of the Earl of Northwick, and then assigned to Domenico Ghirlandajo. His reason for thinking this is that Dr. Waagen does not speak of this work in his account of the Hertford Collection in the "Treasures;" but in another place he warmly claims for Leonardo the before-named Ghirlandajo of the Northwick Collection. This collection was sold in 1859, and very possibly the picture might then have passed into the hands of the Marquis of Hertford. If so, it is one of the great title-giver Dr. Waagen's advancements to honour. Prof. Gutenberg considers that the advancement was merited.

In a manuscript codex preserved in the library at Wolfenbüttel some remarkable sketches have been discovered, apparently the work of an Italian master of the thirteenth or beginning of the fourteenth century. These sketches, three of which are reproduced in the *Zeitschrift für bildende Kunst*, are not the work of an illuminator, but point to a master who was accustomed to large and dramatic compositions, and who appears to have had some knowledge of antique art. There is certainly more nature and motion in his figures than is usual with the masters of the Byzantine Italian school. The sketches, pen drawings with the shadows somewhat darkened with Indian ink, were apparently made before the manuscript was written. It is supposed that some learned writer made use of the blank leaves of an artist's sketch-book as writing material.

MM. Leighton, Mateijko, and Dauban have been named corresponding members of the Académie des Beaux Arts in place of the late MM. Schwin d'Aligny and Bodiner.

Three new rooms in the Louvre have recently been opened to the public. These rooms are devoted to the large works of Reubens, Van Dyck, Sneyders, Gaspard de Crayer, and other masters of the same school which, in consequence of the late alterations, have been displaced from the great gallery.

The *Chronique des Arts* tells us that the "event of the season for the artistic world of Vienna" has been the sale of the ancient and modern paintings in the collection of M. Sedel-

meyer. Among the modern paintings, the highest price was realized by a Meissonier, "Gentleman of the time of Louis XIII.," 20,000 fr.; while of the old masters, Ruysdael's "Forest of Oaks" was sold for 44,000 fr., and "A Flemish Interior," by Teniers, for 36,000 fr. There were no important Italian works in the collection.

A new magazine for children, with the title of *Deutsche Jugend*, has appeared in Germany. The illustrations are chiefly by Oscar Pletsch, the most charming delineator of child's life.

### Theology.

**The Pentateuch and Book of Joshua Critically Examined.** By the Right Rev. John William Colenso, D.D., Bishop of Natal. Part VI. London: Longmans, Green, & Co. 1871.

IT must be an inveterate prejudice indeed which can withstand the accumulated evidence of the mature character of Bishop Colenso's criticism presented in this and the preceding part of his work. The slightly naive realism of the first volume, the obviousness of much that was advanced in the succeeding parts, are now exchanged for a comprehensiveness of treatment and an assured grasp of the subject, which the unfavourable circumstances of a bishop in a distant colony scarcely entitled us to expect. This is the least acknowledgment which liberal and liberal-conservative critics both in England and Germany owe to the author. Some, however, and among them the present writer, will not be satisfied with such a slender recognition. Those who have received their first introduction to the historical criticism of the Scriptures from a German source, and have followed the development of the Pentateuch controversy principally in German monographs, may be excused if they are surprised into a warmer expression of gratitude to the English author of the (in some respects) greatest work as yet produced on the subject. It may be hoped that our German friends, to whom we are indebted for so much stimulus and sympathy, will more and more abandon their attitude of comparative isolation, and recognize the international character of biblical criticism. In a subject which has suffered so much from the disturbing influences of imagination or tradition, a constant interchange of thought between students of various schools is more than usually necessary. At any rate, a writer who is so scrupulously just to others as the Bishop of Natal, deserved a less disparaging treatment than

he has lately received from two well-known German scholars, Dr. Delitzsch, of Leipzig, and Dr. Merx, of Tübingen.

A work which pre-supposes such a multitude of special researches cannot be criticized in detail within the limits of a comprehensive journal like the *Academy*. There can, I think, be little doubt that the most important results of the Bishop and his allies (Graf, Kuenen, and Kalisch) will be confirmed by an increasing number of critics, though theological prejudices in England, combined in Germany with prepossessions induced by a long critical tradition, may for some time retard the conclusion. (Cf. notice of Kalisch's *Leviticus*, *Academy*, vol. iii., p. 248.) The main lines of the argument are all that I can attempt to give here. The first point established by the Bishop is that Lev. xviii.—xxvii. were written during or after the Babylonian exile. The proofs of this have been given sufficiently by Graf (*Die gesch. Bücher des A. T.*, p. 75, &c.), whose view as to the partial authorship of Ezekiel has, I think, been victoriously asserted by the Bishop in Appendix §124 and 125 against Kuenen and Nöldeke. Dr. Kalisch's somewhat dogmatic remarks on Lev. xviii. do not affect the Bishop's arguments. This result at once suggests the inquiry whether other portions of the middle books of the Pentateuch may not have been written during the same period. It is important that we have a fixed point to start from in the well ascertained date of Deuteronomy (*i.e.*, the seventh century, B.C.), the main part of which (chaps. v.—xxvi., xxviii.) contains a number of references to the facts related in Exodus and Numbers, proving that the writer was acquainted with something closely resembling the present narrative. On the other hand, he offers a direct contradiction to the account of the making of the ark in Exodus, which would have been impossible if he had had that record before him. This involves the late origin not only of Ex. xxv.—xxx. 17, xxxv.—xl., but of all those passages of Leviticus and Numbers which refer explicitly or by implication to the contents of those chapters. The author next points out the passages of later legislative origin in Num. xi.—xxxvi., Deut. xxxi.—xxxiv., Joshua, and Exodus, noting also those parts which belong to the older narrative and the Deuteronomist-editor respectively. The "original story" in Exodus, Numbers, Deuteronomy, and Joshua is given at full length, and a series of notes, in which Keil's counter-arguments are examined. (See especially chap. xx., on the origin of the Passover.) The date assigned to the later legislative passages is confirmed historically by a great variety of details, which would no doubt have gained much had the second part of Dr. Kalisch's *Leviticus* been accessible to the author, with copious references to Keil on the conservative and Graf on the liberal side. Ezra, "the scribe," is indicated as the collector, and probably to a large extent the writer, of most of these later passages, though the process of revision, and even to some extent of composition, was not finished till afterwards. (Cf. Dr. Kalisch's conclusion, *Leviticus*, Part ii., pp. 637-639.) This is the thread of Bishop Colenso's argument, and though the paragraph form in which it is displayed is wanting in elegance, it will probably be found extremely convenient to those who are beginning the subject, or are unwilling to be burdened with many books of reference. The conscientiousness of the author in excerpting the best standard works, such as those of Graf, Popper, Kuenen, and Keil, instead of serving up their contents as his own, cannot be too much respected.

The concluding chapters contain (1.) an inquiry how far the date assigned to the Jehovist in Part v. (which still seems to me too ancient) is borne out by the data contained in Exodus, Numbers, and Joshua; (2.) a statement of the author's views with regard to those Elohist narratives in Genesis

and Exodus which are unconnected with the Levitical legislation, in opposition to the earlier hypothesis of Graf on the one hand, and above all to that of Kuenen on the other; (3.) a sketch of the development of the story of the Exodus, chiefly after Kuenen; and (4.) a summary of the religious reforms in which criticisms like the foregoing may be expected to issue—a summary which one would have been sorry to miss, though it is here scarcely in its right place.

There still remains the Appendix, which has a value distinct in kind from the rest of the work. The tone of the latter has often an appearance of dogmatism, or rather of over-confidence in the power of criticism, which will be repellent to many readers. "Zwar weiss ich viel," it seems to say, "doch möchte ich Alles wissen." The fault, so far as it exists, is amply redeemed by the thoroughness and circumspection of the phraseological analysis, with which no similar continental work can, so far as my experience goes, pretend to compare. It is difficult to single out examples where there is so much to commend, but I would especially call attention to the analysis on which the Bishop mainly founds his opinion that the Decalogue in Ex. xx. 1-17 is entirely due to the author of Deuteronomy (Appendix, p. 99, cf. in the body of the work, pp. 147, 168 top., and 608 foot.) That it is in no sense Mosaic had been already argued by Dr. Land (*Theol. Tijdsch.* iii., 359, &c.), who is answered, but not satisfactorily, by Mr. C. P. Tiele in his *History of the Egyptian and Mesopotamian Religions*, p. 564, note.

Hardly less important for the moment, though it would have found a fitter place in an international organ of criticism, is the Bishop's detailed examination of the rival hypotheses of Kuenen and Nöldeke. The arguments of the former scholar, to which the criticisms of the Bishop refer, are to be found in his *Religion of Israel* and the *Theological Journal*, now published at Leyden. I cannot refrain in passing from offering a tribute of admiration to the rare union of excellences in the former work, which compares not unfavourably in several respects with Ewald's more ambitious and brilliant *History of the People of Israel*, for even if it displays less psychological insight, and fewer of the intuitions of genius, it also presents far more of that careful scientific method which is too often conspicuous by its absence in the critic of Göttingen. The second volume, to which Bishop Colenso refers, seems to have as yet escaped the attention of any but Dutch reviewers. A cognate form of hypothesis, maintained in his last dissertation by the late K. H. Graf, was examined in an instructive essay in the *Studien und Kritiken* by Prof. Riehm, of Halle, but the objections urged by that very able critic only affect the position of Dr. Kuenen to a very slight extent. That position is, that the principal Elohim-record, generally called the *Grundschrift*, is continuous and self-subsistent (against Graf in his later stage), and that the whole of it, and not only, as Colenso thinks, the Levitical legislative passages, was composed during or after the Babylonian exile. If this view is tenable, one of our main sources of Israelitish tradition is cut off, for it is scarcely probable that Dr. Kuenen will undertake the task which his reviewer in the *Academy* (vol. iii., p. 12) suggested, "of analyzing these records, with the view of detecting still more ancient ones." The importance of this result justifies entering into somewhat more detail.

Bishop Colenso, then, begins by re-stating the grounds on which he holds the antiquity of the Elohist narrative in Genesis. His first point is that this narrative differs essentially from the Later Legislation in the last five books of the Hexateuch by its continuity. 1. The Jehovistic passages are not continuous, but were written to supplement the primary Elohist story. The proof of this is assumed from the previous volume. Appearances are in favour of its

correctness, but it should be sifted anew after the determination of the fresh questions which have arisen. III. The stress laid upon Hebron, in the Elohist narratives, which points to a time when it "filled a conspicuous place in the history of Israel." (Kosters, *Theol. Tijds.*, vol. vii., p. 48, replies that the author was referred to Hebron by tradition, that it was the principal of the priests' cities, and that no city but Hebron had a claim to be so honoured, Shechem being obnoxious to a writer who lived after the exile, and Jerusalem being a comparatively modern name.) IV. The suppression of the name Yahweh, previously to the revelation in Ex. vi. 2-5, is inexplicable in a later writer, who had before him the narratives of the Jehovist; and equally so is the insertion of Ex. vi. 2-5 by a writer who had before him the account in Ex. iii. 1-15. (But the Elohist may easily have had some method of harmonizing the discrepancy. And as for Ex. vi. 2-5, it was essential to the completeness of a record which *ex hyp.* was self-subsistent.) V. The form in which the notice of Hadar appears in *Gen.* xxxvi. 39, implies the hand of a contemporary of Samuel. (Cf. Ewald, *Gesch.* i. 113. The Bishop's view implies that the list of kings is defective.) VI. There appear to be references to these narratives in præ-exile books of the Old Testament. (True, but they are not always convincing.) VII. If *Gen.* ix. 4, belonged to the Later Legislation we should expect the formula, "He shall be cut off from his people," as in *Lev.* vii. 27, &c. VIII. There is no sign of priestly interest in the Elohist narratives; above all, no mention of sacrifice. (But, according to Kuenen, the latter circumstance arises out of the Elohist's favourite theory of the successive stages of divine revelation.)

The Bishop next passes to the arguments of Kuenen for a later post-exile origin of the debatable passages. The minuteness of the discussion is in proportion to the importance of the question. 1. "There is the unquestionable fact of a very remarkable resemblance in phraseology between these passages and the Later Legislation," from which the Leyden professor infers an identity of authorship. Bishop Colenso accounts for this fact by the veneration which late writers would naturally feel for the oldest monuments of their religious literature. And against it, as appears from an earlier passage (p. 583), he would set the facts—(1.) That almost all the expressions peculiar to the non-Elohist portions of Genesis appear in the Later Legislation or in the kindred prophecy of Ezekiel, and (2.) That the Later Legislation contains numerous formulæ which are entirely unknown to the Elohist in Genesis. II. Another argument is drawn from the supposed priestly interest and artificial calculations of those narratives. For proofs of the former Kuenen refers to the institution of the Sabbath, *Gen.* ii. 1-3, the law of abstention from blood, *Gen.* ix. 4, and the law of circumcision, *Gen.* xvii. The Bishop remarks in reply that special prominence is given to each of these points either in the laws of the Original Story or the prophetic narratives written about the time of Samuel. The idea of the Sabbath in *Gen.* ii. is free from the sternness with which it was invested in the Later Legislation. (Cf. R. Martineau's paper, noticed in *Academy*, vol. iv., pp. 30, 48.) As for circumcision, it is rather assumed in the Later Legislation than anxiously enforced, as in *Gen.* xvii. The passages quoted as bearing a statistical character, so far as they are really Elohist, have nothing in them sufficiently artificial to preclude the possibility of a very early date. The view adopted by Kuenen, from Nöldeke, that the Elohist, by a familiar artifice, arranged his figures so that 2,666 years should elapse between the Creation and the Exodus, *i.e.*, exactly two-thirds of 4,000 years,—“depends entirely upon the datum in *Ex.* xii. 40,

which makes up the number 2,236 to 2,666. But this datum is due to the Later Legislation; whereas the number of years in the Elohist narrative to the Flood (1656) and to the Descent into Egypt (2236) are quite unsymmetrical, and indicate no system whatever."

Passing over the more special arguments for a later date, I may be allowed to refer to the most plausible one of all, drawn from the prosaic simplicity and high religious standing-point of the Elohist, which contrasted with the dramatic fulness of detail, the imperfect morality, and the anthropomorphisms of the Jehovist. It may perhaps be doubted by Kuenen and his friends whether Bishop Colenso has given enough space to the consideration of this argument, which has been developed anew with much force by W. H. Kusters in the January number of the *Theological Journal* of Leyden. The Bishop is of opinion that the difference between the Elohist and the Jehovist in descriptions of the same events can be accounted for more easily on the supposition that they were almost contemporaneous than that they were divided by a long interval. And he remarks that a "priestly writer" would have had no interest in "contradicting" the Jehovist on such a minute point as the cause of the separation between Abram and Lot. It is obvious, however, to reply that though the work of the Jehovist was ancient, it was certainly not "canonical" in the time of the Elohist, and that from the standing-point of the latter it was more pious towards the patriarchs to represent them as separating amicably than as the result of a dispute. Still I do not myself see that the difference in standing-point between the two writers is conclusive as to their dates. It is easy to suppose that the Elohist belonged to a different circle from the Jehovist, and we know too little of the characteristics of the different ages and communities of Israel to deny this.

The justification of the slightness of the Bishop's mode of treatment in this case lies in the fact that such a line of argument as that adopted, for instance, by Dr. Kusters is unfruitful at the present stage of the discussion. Many, if not all of the passages quoted by him, obviously admit of two interpretations. When, for instance, in the Elohist account of the Deluge the months are referred to as the first, second, and so on, instead of by their proper names, it may be, as in Deuteronomy and Jeremiah, and in the books of Kings, because the names had gone out of fashion; but it may also be because the writer considered that the use of them would involve an anachronism, as in the case of Yahweh. The second alternative is left out of sight by Dr. Kusters (*Th. Ti.*, 1873, pp. 34, 35). His next instance is equally doubtful. It is not clear that the genealogy of the Cainites in Gen. iv. is the original of that of the Sethites in Gen. v., because the former has (or appears to Dr. Kusters to have) fewer names. It is a pure assumption of Schrader (in his first stage) and Kusters that v. 29 originally stood after iv. 22 (or 24); it is more obvious to explain it as a Jehovistic supplement to v. 28. If so we have exactly ten patriarchs in both genealogies, that is, if we reckon in the three sons of Lamech, two of whose names were evidently formed by the narrator on the model of the third, simply, it seems to me, to make up the round number ten.

But one instance more. Dr. Kusters (*ibid.* p. 38) rejects Bishop Colenso's view that Gen. xvii. is alluded to in xxiv. 7, on the ground that a covenant is not the same as an oath. But: "I swore that the waters of Noah should no more go over the earth" (Isa. liv. 9)—"I establish my covenant with you, neither shall all flesh be cut off any more by the waters of the flood" (Gen. ix. 11). The identity is complete.

Such are the points which seem to at least one reader of this work among the most important of its multifarious con-

tents. It must suffice merely to mention the able though incomplete reply to Prof. de Goeje's attempt to prove the late origin of Gen. x. (see *Th. Ti.*, 1870, pp. 233-268). It is unwise, perhaps, to pronounce decidedly against that acute critic's hypothesis till we have more complete information as to the geographical names current among the neighbours of the Jews in the præ-exile period. I think however that the extension given to the *Grundschrift* by Professor Nöldeke has been satisfactorily disproved by the Bishop in section 125 of the Appendix. His depreciation of the Elohist, or however else we please to call the author of that document, seems to me, in common with the Bishop, to be largely exaggerated, and based unconsciously, no doubt, on a preconceived opinion. It is of course no wonder that both Nöldeke and Kuenen were fascinated by the brilliant suggestion of Gutschmid (so agreeable to analogy) that the Elohist had a symmetrical chronological system, and must therefore have written late, but most readers will, I think, agree with the Bishop (Appendix, p. 133) in consigning it to the limbo of imperfect inductions.

It must also suffice to allude to a few minor points which seem to deserve reconsideration. Page 165, Is Joel as a whole really so ancient? P. 424, This derivation of Pesakh is questionable. P. 582, Do Gen. vii. 16b, viii. 20, refer to the foregoing portion of the Elohist narrative? P. 584, Is the rendering of Gen. i. 3 adopted by Ewald and his able English editor sufficiently natural? (I venture to prefer Graf's grammatical interpretation of the passage.) P. 585, Has the Bishop given the right explanation of the archaisms? (Cf. Geiger *Ürschrift*, p. 235, &c.) P. 609, May not Yahweh have been imported into Phœnicia from Judea as Asshur was imported from Assyria?

Of course the questions re-opened in this volume by Bishop Colenso must not be taken for settled. His main point is in all probability, as I have remarked already, certain of ultimate acceptance; but it is presented to us in connexion with a group of hypotheses, the arguments for which demand the most careful scrutiny. The most remarkable of these hypotheses are (1.) the large share given to the Deuteronomist and Later Legislator in editing and interpolating the first four books of the Pentateuch, and (2.) the separation of the Elohist narratives from the Levitical legislation. It is much to be desired that several independent scholars should investigate the first four books with reference to these positions. As to the first, a distant approximation to the procedure of these ancient editors, who were by no means so mechanical as their modern successors, is all that can fairly be expected. And as to the second a valuable hint is offered by the Bishop himself in section 549, where he points out that the Levitical legislation contains most of the distinctive phrases not only of the Elohist but also of the non-Elohist elements of Genesis, in addition to numerous formulæ, of which there is no trace in the earlier portions of the Pentateuch. The comparison must, however, be extended to the ideas as well as to the phraseology of the disputed portions, and here no doubt is the chief difficulty. Our only chance of overcoming it is the persistent development of an international conception of biblical criticism.

T. K. CHEYNE.

**Dr. Pusey's University Sermons.** [Sermons preached before the University of Oxford, between A.D. 1859 and 1872. By the Rev. E. B. Pusey, D.D., Regius Professor of Hebrew, and Canon of Christchurch. Second Thousand.] Parker and Rivington. 1872.

THE sermons in this volume are for the most part given without dates, and not in the order of their delivery: an arrangement which one may the more venture to regret on

account of the statement of the preface, that they were preached "mostly at distant intervals," and "suggested mainly by the circumstances of the times or the occasions on which they were preached." The historical interest, so to call it, of the volume is thus considerably impaired. It would of course be possible for anyone who had convenient access to University records to identify and tabulate the dates, but to an ordinary reader the republication of some passages produces the effect of raking the ashes of controversies now either extinct or shifted to different ground.

In truth, this disappointing effect would not be altogether effaced by an index of dates added to the next edition. It is not owing to occasional blemishes, such as it would be easy to lay a finger on: words like "engraced," "enwise," "engodded," "instrengthen," sentences like "let, he who will, let them go" (p. 432), are not English; and where, as at pp. 143-4, this inaccurate language is imported into translation, and the changes rung on "he who" and "him whom," as though they were identical in construction and meaning, the defect is one of matter as well as form. But let anyone read the book through, and he will feel that such criticisms as these are captious; that he is in the presence of a man who has "a genius for godliness,"—whose spiritual power is amply sufficient to do the work of philosophical accuracy or literary grace. It is not possible to be as good a man as the preacher without being something very like a great one: agree or not with his opinions, no reader or hearer can deny that, in things of the spirit, he has made good his right to hold them and recommend them. In one place he has subjected our deference to a very strict test—there is probably not another man in England who could have made the personal confession which we read towards the close of the ninth sermon without offending either the taste or the judgment.

Yet the book is disappointing. The reason is stated in the preface in terms that seem to imply that the author is disappointed himself. "A few of the last" (and best) "in the volume were delivered at a time when the necessity for Roman controversy had subsided; and the writer hoped to be able for the rest of his time to preach to the younger part of his audience on practical subjects. This hope was destroyed by the publication of the *Essays and Reviews*. . . ." And thus the sermons are devoted quite as much to controversy as to edification: and one often feels that the strength of the writer's mind is wasted on an ungenial and uncongenial task—perhaps frittered away on matters of small and temporary interest. Possibly it was unavoidable: if a proposition be denied, those who mean to build on it will be charged with ignorance if they assume it as certain, and so may be forced to re-assert and defend it; and a man in Dr. Pusey's position should be trusted to know when, from his own point of view, controversy thus becomes a necessity or a duty. Else, as a matter even of polemical strategy, one might question whether a different course might not have been more effective; and as a matter of literary interest, there can be no question at all. The *Essays and Reviews* were in a way a representative book: there was a good deal of their spirit in the air, which their publication served to precipitate. But their authors, with one exception, were in no sense leaders of thought; and Dr. Pusey, who to some extent is one, seems to lower himself by attempting detailed replies to them, instead of quietly seeking to counteract the spirit he thinks unhealthy by concentrating and diffusing his own.

Granting that the sermons are to be argumentative, their arguments fall into different classes of different degrees of value. Three were delivered on the annual stated subject of the Jewish Interpretation of Prophecy, for which Dr.

Pusey has been selected by each of the three Vice-Chancellors who have held office within these dozen years. It is, in fact, a subject that seems especially designed for him; for, among the few men that have the special knowledge of Rabbinical literature required for it, there are few orthodox English clergymen, and fewer great preachers. The reasoning of these, and of the three others which are also occupied more or less with the evidential argument from prophecy, scarcely calls for detailed examination: their main purpose is to support the received Messianic interpretation by common-sense Hebrew scholarship and appeal to Old Testament usage, often attested by Rabbinical tradition. As a statement of the case they may be a fair one, but as an argument to carry conviction to the unconvinced they are necessarily inadequate: the conditions of a sermon do not admit of the subtlety, hardly of the accuracy, required for that purpose. It would be unfair to demand that anyone preaching on a text from the Second Epistle of St. Peter should enter on the question of its authenticity; even on Isaiah xlix. 5, we do not complain that we are not told that the words rendered in the A. V., "Though Israel be not gathered," and by Dr. Pusey, "And Israel, which will not be gathered," may very plausibly be taken to mean the exact reverse. It is indeed a little too much when on p. 86 we read, as a translation of Isaiah liii. 10, "His soul shall make an offering for sin," while on p. 92 in the same sermon the rendering of the A. V. is restored and an argument founded on it. But as a rule it is enough to say of such things that a preacher has the privileges, as well as the responsibilities, that come from his audience having no reply.

The objection to *a priori* arguments, such as that of the first in the volume, "Grounds of Faith difficult to analyze because Divine," is deeper. The writer seems to have no common canons of argument with those whom he seeks to convince. We meet with the same confusion, or what looks like confusion, as in Dr. Newman's *Grammar of Assent*: it seems to be assumed that complexity of causes, reaching beyond our powers of analysis, is the same thing with essential unity that admits of no analysis, or with uncaused self-origination. Dr. Pusey may hold that the parental, or at least the conjugal, relation is itself a "mystery," with a supernatural element that makes it a fit illustration for other things supernatural; but the love of country, however nearly, when developed, it may amount to an instinct, clearly admits being traced to known principles of human nature. And what weight has a passage like this? "Analyze eloquence! Analyze the whirlwind or the lightning! Yes! these you may analyze, for they are material; eloquence you can no more analyze than the soul itself, whose voice it is, in the simplicity of its immateriality." Are not men at the mercy of oratory nearly in proportion as their reasoning powers are feeble, or their judgments uneducated? If from the intensity of such influence any inference at all can be drawn, it will be, not that faith is supernatural, but that natural and even vulgar causes can produce effects as completely *sui generis* as faith itself. Dr. Pusey in the preface renews his old protest against the use at Oxford of "ill-chosen textbooks." Certainly an undergraduate who has read Mill's Logic could not be convinced by an argument like the above even if he already accepted its conclusion. Not only is it mere rhetoric: it is the rhetoric of a past generation, that now fails as completely to persuade as to convince.

Dr. Pusey's life, even his public life, has already been a long one; but on the alarm of his recent illness many must have felt that they could ill afford to lose him, and that not only on personal and still less on party grounds. Both in its strength and its weakness this volume suggests the hope that he may at length have rest from the wars which

were about him on every side, and be left free for what he is much fitter for, to sing a *Diligam te Domine*.

Alexander von Humboldt: eine wissenschaftliche Biographie im Verein mit R. Avé-Lallemant, J. V. Carus, A. Dove, H. W. Dove, J. W. Ewald, A. H. R. Grisebach, J. Löwenberg, O. Peschel, G. H. Wiedemann, W. Wundt; bearbeitet und herausgegeben von Karl Bruhns, Professor und Director der Sternwarte in Leipzig. In drei Bänden. Leipzig: F. A. Brockhaus. 1872.

As the fourteenth of September, 1869, the hundredth anniversary of the birth of Alexander von Humboldt, drew near, it was remarked that there did not exist any comprehensive description of the life and labours of the philosopher whose name was about to be celebrated in all quarters of the globe. This arose mainly from the fact that no single biographer was in a position to grasp the many sides of Humboldt's nature. Then it occurred to Professor Bruhns to invite a number of learned men to join him in composing a biography which should depict Humboldt from every view-point of his activity. The general scheme of the work embraced two greater divisions—first, Humboldt's outer life; second, his doings in the various domains of science. In its preparation the editor was enabled to make use of a much more extensive and rich original material than ever was anticipated. The Berlin Observatory lent Humboldt's manuscripts; the Ministerin von Bülow, a niece of Humboldt, permitted the use of the diaries of his travels; many hundreds of letters to personages in high station, to learned men at home and abroad, to friends and relations, have been collected and examined; some larger collections—specially that of Herr Seifert, Humboldt's faithful chamberlain—were bought, so that the descriptions contained in these volumes lay claim to completeness and truth. The first volume, which tells the story of Humboldt's youth and middle age, as well as of his journeys in America and Asia, is written by Julius Löwenberg, who was possessor of many original documents relating to these periods. In the second volume Dr. Robert Avé-Lallemant, who has himself personally moved in the scientific circles of the French capital, depicts the period of Humboldt's years of study and labour in Paris; and Dr. Alfred Dove, aided by a rich store of existing material, and with great experience of Berlin life, has described Humboldt's later years most fully. A bibliographic list of works, treatises, and scattered papers by Humboldt, compiled by Julius Löwenberg, and numbering upwards of six hundred, concludes the second volume.

The third treats of Humboldt's researches in the various branches of science, and is composed of eight essays by masters in each of the scientific domains into which Hum-

boldt's genius led him to explore. Professor Bruhns takes up Humboldt's mathematics, astronomy, and mathematical geography; Hofrath Gustav Wiedemann his separate physical and chemical experiments; Professor H. W. Dove the meteorology; Professor Julius Ewald the geology; Professor Oskar Peschel the *Erdkunde*, ethnology, and political economy; Hofrath August Grisebach the botany; Professor Victor Carus the zoology and comparative anatomy; and Professor Wilhelm Wundt the physiology, of Humboldt's works, notably of his travels and of the *Kosmos*.

Three portraits of Humboldt, at the ages of twenty-seven, forty-five, and eighty-one years respectively, accompany the work; the first is from a painting in the possession of the Ministerin von Bülow, which was taken in 1796, and has never hitherto been copied; the second has a special interest, since its original was drawn by Humboldt himself from a mirror in Paris in 1814; the original of the third is one of the few portraits painted by Edward Hildebrandt, who was an intimate friend of Humboldt in his later years.

It is impossible in the limits of this notice to deal specially with each portion of this many-authored work, and it may be of greater interest and utility to trace from its pages the rough outline of Humboldt's life and working, somewhat in chronological order.

Alexander von Humboldt sprang from an ancient noble family of the house of Zemmenz, in further Pomerania. His father, Major von Humboldt, married, in 1766, the widow of Captain Ernst von Hollwede, a daughter of the Director of the East Frisian Chamber, Johann Heinrich von Colomb.\* From this marriage were born a daughter, who died early, and the two sons, Friedrich Wilhelm Christian Carl Ferdinand, born in Potsdam on the 22nd of June, 1767, and Friedrich Wilhelm Heinrich Alexander, born at 22, Jäger Strasse, in Berlin, on the 14th September, 1769.

"In the year of Alexander's birth Napoleon, Cuvier, Châteaubriand, Canning, Wellington, and Walter Scott were born. The hour of his birth was the culminating one of the victorious career of Prussia's greatest monarch. Lessing already illuminated the horizon of German spiritual life, Kant ruled the laws of thought, and in Goethe, only twenty years of age, the storm and power of the period of our German classical literature already sounded. Such were the brilliant stars of his horoscope." The Prince of Prussia, afterwards King Friedrich Wilhelm II., was sponsor at his baptism.

The early years of the brothers Humboldt were spent together, the summers in the little château of Tegel on the Havel, their paternal residence, the winters in Berlin. Kunth, the son of a Protestant clergyman in Baruth, became tutor to the brothers in 1777, and of all their earlier instructors appears to have exercised the strongest influence in developing their powers and in guiding their bent. Alexander began early to show a preference for the objects of natural history; plants and flowers, sparrows and beetles, mussels and stones were his favourite playthings, and he arranged and classified his collections with such zeal as to earn for himself the by-name of the "Young Apothecary."

The desire of his parents being that he should devote himself to finance, he entered the University of Frankfurt on the Oder in 1787 as a student of political economy; but this branch of education was of such a low standing at Frankfurt, that "er studirt cameralia" had become a name for one who learned nothing. Returning to Berlin in the following year, a friendship sprung up between Humboldt

\* Thus by a remarkable freak of destiny, the mother of "the scientific discoverer of America" bore the same name as its geographical discoverer of the 15th century.

and the botanist Willdenow; from this date Humboldt's botanical studies commenced, and the first-fruit of his published work was a botanical paper, "Sur le Bohon-Upas," in the *Gazette litt. de Berlin* of the 5th and 12th January, 1789. In this year Humboldt went to Göttingen, whither his brother had preceded him. The University was at that time in the flower of its scientific repute, and its faculties boasted men whose learning was famed throughout Germany.

In the house of Professor Heyne, Humboldt became the intimate friend of George Forster, who sympathized thoroughly with his aspirations, and had great influence in moulding his plan of life. Forster had already accompanied Cook in his second voyage round the world, and was a master of almost every branch of natural history, physics, and chemistry. With Forster, Humboldt made his first tour abroad to Holland, Belgium, England, and France. Following out his studies of finance and political economy, Humboldt attended the Academy of Trade in Hamburg during 1790-91. His next movement was to the School of Mines at Freiberg, in Saxony, where, among others whose names were afterwards to become famous, he met Leopold von Buch as a fellow student. "In Freiberg, Humboldt concluded his years of academic study. It was, however, neither mineralogy nor mining, botany, physics, or chemistry that had exclusively occupied his attention; it was rather the general conditions of organic life that he sought to decipher even in the deepest and darkest corners of the mines." In 1792, in his twenty-second year, Humboldt took public service as *Berg Assessor*, and favoured by his social position and great acquirements found the gates which led to honours from the State thrown wide open to him. Appointed soon after to the office of *Oberbergmeister*, he was sent, at his own suggestion, to examine and report on the mines in Upper Bavaria, Salzburg, Galicia, and Upper Silesia in a series of tours. In 1794 he was politically engaged in the suite of the Minister von Hardenberg, in the negotiations which terminated the war with France in the peace of Basle, in September of that year. In May, 1795, Humboldt decided to leave the Government service, and to devote himself to scientific exploration; and this resolve he followed up by a tour throughout the Alps, to examine the bearing and connection of the different parts of the chain, and collect material for a work "On the Formation of the Earth in Central Europe," which however did not appear in this form.

During the war of 1796 we find Humboldt again employed as a diplomat in preserving the neutrality of the provinces of Franconia and Hohenlohe; later in the same year, however, he had returned to more congenial labours, and was engaged in meteorological investigations at Berlin. The death of Humboldt's mother at the end of this year, after a lingering illness, formed a turning-point in his career; it freed him from the bonds which had tied him to home, and gave him the fullest means of carrying out the long treasured plans of travel, of gratifying his ardent desire to visit the tropics. In November, 1797, a wealthy Englishman made a proposal to Humboldt that he should accompany him to Upper Egypt. "This was Lord Bristol, Bishop of Derby, decidedly a free spirit in spite of his high function in the Church, and with an income of £60,000 a year, one of the most fashionable men of the world, an enthusiastic patron of the fine arts." But shortly after Humboldt's arrival in Paris on his way to join him, the news arrived that Lord Bristol had been arrested in Milan on suspicion of being about to agitate in Egypt for England against France. Thus the projected journey to Egypt had to be abandoned; but a more extensive plan took the place of this one. Writing to Willdenow at this time, Humboldt

says:—"I was received in Paris in a manner such as I never could have anticipated. . . . Old Bougainville has projected a new voyage round the world, to be directed specially towards the South Pole. He asks me to follow him, and since I am just at present engaged in magnetic investigations, a voyage to the South Pole has greater attractions for me than even a journey to Egypt. I was full of hope and expectation, when suddenly the directors arrived at the heroic resolve not to send Bougainville, who is seventy years old, but to allow Captain Baudin to make a voyage round the world. Scarcely had I heard this decision when I received an invitation from the Government to accompany the 'Vulcan,' one of the corvettes of the expedition. All the national collections are thrown open to me that I may choose from them whatever instruments I may wish. I am to be consulted in the choice of naturalists, and in every part of the preparations. . . . The first year is to be passed in Paraguay and Patagonia; the second in Peru, Chile, Mexico, and California; the third in the South Seas; the fourth in Madagascar; and the fifth in Guinea." Later he writes: "What an inexpressible grief is it to me that in fourteen days each and all of these hopes have been shattered. The causes assigned for relinquishing the project are the cost, and the fear of an approaching outbreak of war."

Humboldt now conceived the plan of following Buonaparte's Egyptian army by the land route from Tripoli, through the desert to Kairo, and with this intent left Paris for Marseilles in company with the young botanist Bonpland. Here a fresh delay occurred in procuring a sea passage. Meanwhile came the news that the Dey of Algiers had prevented the caravans from starting for Mecca, that they might not pass through Egypt defiled by the presence of Christians. Turning now to Spain, Humboldt and his companion travelled through the peninsula, engaged in collecting botanical specimens, in determining the positions of places, measuring elevations, and making meteorological, geological, and magnetic observations. In Madrid, Humboldt experienced the fulfilment of his long cherished wish, by obtaining from the King permission to travel in the Spanish colonies of South America.

Now follows Humboldt's great journey of five years in America—from the 5th of June, 1799, when the "Pizarro" weighed anchor in the harbour of Coruña, till his return to Bordeaux in August, 1804. At the end of last century the American colonies of Spain stretched without a break from the north-west point of California to beyond the most southerly part of Chile, embracing the whole of the present Southern States of the Union, and all the South American continent except the Brazils, Patagonia, and Tierra del Fuego. Up to this time this vast territory had not been explored by any scientific traveller, and Humboldt's journey lay through an almost unknown region. Whilst former travellers had gone to satisfy simple curiosity, and had set down every experience as of equal moment, taking care to relate their own personal adventures with epic fulness, Humboldt, carefully avoiding personal details, made nature in the manifold relations and connections of her phenomena the object of his study, referring every object to its place in the one great system. As far back as 1796 he had written, "Je concue l'idée d'une physique du monde:" the comparison of observed facts was to him of greater value than the search after scattered novelties. But such a journey could not but yield immense additions to every branch of knowledge. Among his many remarkable discoveries was that of the hydrographical union of the basins of the Amazons and Rio Negro in the natural canal of the Casiquiare; his ascent of the giant Chimborazo, then believed to be the highest mountain of the world, to an elevation of 18,069 Paris feet, an

elevation above the earth's surface never previously reached by man; the exploration of the volcanic plateau of Jorullo in Mexico which had suddenly arisen in one night of 1759; and the measurement of the height of the colossal M<sup>t</sup> Popocatepetl, the summit of North America, are among the well remembered points of interest in his journey.

On setting out for America, Humboldt had left France a Republic; he returned to find an usurper on its throne, and its people, still delirious in the glory of victories, were celebrating the "Napoleon's Day" as he entered Paris in August, 1804. But science had been progressing with rapid strides, and Paris had undoubtedly become the world's school of the exact and especially of the natural sciences. Humboldt renewed old friendships, and many men now sought his acquaintance, among whom were the famous chemist Gay-Lussac, and Franz Arago, the astronomer. Wherever he appeared in private assemblies or in meetings of learned bodies Humboldt was a hero. One man only there was who met him with rudeness and lasting dislike—Napoleon—whose almost contemptuous words on receiving Humboldt are recorded, "You busy yourself with botany; my wife occupies herself with that." The arrangement of the treasures of his collections and the preparation of an account of his journey now busily occupied him. In March, 1805, however, he visited his brother Wilhelm in Rome, and nature appears to have favoured his visit to Italy, for just then an outbreak of Vesuvius occurred, and was witnessed by Humboldt, Gay-Lussac, and Leopold von Buch together. Having returned to Berlin in November, 1805, Humboldt was nominated chamberlain to the king, and received a royal pension of 10,000 francs. At this time, besides actively progressing with the work of his travels, Humboldt's papers read before the Berlin Academy were very numerous: "On the Laws of the Reduction of Temperature in the Higher Regions of the Atmosphere," "On Steppes and Deserts," "On the Aborigines of America," "On the Species of Chincona," were among their varied subjects.

In the spring of 1808 the Prussian Government, in the hope of reducing the burdens imposed by the treaty of Tilsit, by means of negotiations with Napoleon, resolved to send the younger brother of the king, Prince William of Prussia, to Paris, and Humboldt, to his astonishment, was ordered to accompany the Prince in his difficult diplomatic mission. The residence of the Prince lasted till autumn of 1809, and Humboldt, finding it inconvenient to carry on the preparation of his work in Germany, received permission from the king to remain in France as one of the foreign members of the Paris Academy. Henceforward for a series of years Humboldt remained in this city, actively engaged in the publication of the many fruits of his great journey, the "*interminable voyage*," and in closest intercourse with a circle of men whose names will in all time be remembered. Long before this great work was completed Humboldt's mind was occupied with plans for the execution of what seemed to him the second mission of his life—to explore scientifically the continent of the Old World also. In this view he studied the Persian language, with the orientalist Silvestre de Sacy and André de Nerciat, as being the easiest among Asiatic tongues, and in 1810 he had decided to accompany a Russian expedition then preparing to visit Upper India, the Himalaya, and Tibet. But the Russian plans were suddenly overturned, and the expedition, for which Humboldt had made every preparation, was not carried out. In 1812 a new expedition was planned in Russia to pass from Siberia by Kashgar and Yarkand to the Thibetan highland; but Napoleon's campaign intervened, and this hopeful opportunity was also lost. Then came the year 1813 with its ever memorable events. When the Cossacks were in Paris,

Humboldt made use of his international position to save the collections of the *Fardin des Plantes* from spoliation, and without his intervention these would certainly have been destroyed. On the thirty-first of March, 1814, Friedrich Wilhelm III., King of Prussia, entered Paris at the head of his troops, and Humboldt was immediately summoned to personal attendance on the monarch. From this time till 1823 Humboldt was almost constantly with the Prussian king, during his visit to London, at the Congress of Aix la Chapelle in 1818, at the Congress of Verona in 1822, and afterwards at Rome and Naples. Three years of undisturbed labour in Paris then followed, and in 1826, at the renewed desire of King William, Humboldt again took up his abode in Berlin.

In 1827 the then Russian Minister of Finance had occasion to request Humboldt's opinion regarding the utilization of platinum, of which a great store had just been discovered in the Ural mountains, as a metal for coinage, and Count Cancrin remarked in his letter that "the Ural would be well worth a visit from a naturalist." This suggestion so fully met Humboldt's long-cherished views as to lead to a correspondence on the subject of Asiatic exploration, and this terminated in a request from the Emperor Nicholas that Humboldt should make a scientific tour in Eastern Russia, the necessary funds being placed at his disposal. At his request Professors Ehrenberg and Rose were permitted to accompany him. On the twentieth of May, 1829, after a splendid reception at Petersburg, the expedition set out. The journey extended beyond the Ural, and across the Kirghiz steppes to the mines of the Altai and the borders of Chinese Zungaria. On the return route the Caspian Sea was visited, in order to ascertain the chemical composition of its waters and its level below that of the sea, and to form a collection of its fishes to enrich the great work of Cuvier and Valenciennes. The fame of Humboldt had spread beyond the Ural, and everywhere he was received with almost regal honours.

In December, 1829, Humboldt, then in his sixty-first year, was again in Berlin; the full desire of his earliest youth to journey in distant lands had been satisfied, and the years of his travelling life were past. Then began the calm years of untiring labour in his home study in Berlin, during which he collected the sum and results of all his travels, studies, and observations in the *Kosmos*, the work of his life, "a monument of the restless advance of modern science." From 1830 till 1848, indeed, he was sent on various diplomatic missions to Paris; but these visits were not of long duration. The later years of his life were spent in Berlin, where his renown attracted men of science and travel from all parts of the world. Humboldt died on the 6th of May, 1859. The *Kosmos* remained incomplete; "slowly as it had dawned, at last, in the late evening of this much experienced life, the night had broken in—the 'night when no man can work.'"

We have seen that the childhood and early youth of Humboldt were surrounded by every possible advantage which could be given by social position and aristocratic birth. His talents had not to strive upwards through opposing poverty and obscurity. But the strength of his character is shown in resisting the attractions and temptations to a life of luxury and ease, such as his interests commanded, and in devoting himself from earliest youth with increasing eagerness and most untiring industry to the cause of knowledge, even in spite of bodily weakness. At the universities, and up to the close of his academical career, the warmth and openness of his character everywhere won for him the true and lasting friendship of his fellows. The only fault of his earlier life is that of "conceit and desire of reputation," recorded in a letter written by his brother William. Eckermann relates how, meeting with Goethe, the

poet said to him, "Alexander von Humboldt has been with me for some hours this morning. What a man he is! I have known him so long, and yet I am ever newly astonished at him. One may truly say that in learning he has not his equal, and such many-sidedness I have never seen before. On whatever subject one may touch he is at home, and overflows with mental treasures." Of Humboldt in his twenty-seventh year Schiller wrote the somewhat harsh opinion, afterwards fully withdrawn: "About Alexander I can give no definite opinion; but I fear, in spite of all his talents and restless activity, that he will never reach any very high position in science; a narrow, inquiet conceitedness seems to pervade everything that he does."

It is very remarkable that Humboldt, whose leading idea throughout life was that of the harmony of all created things, should have been perfectly averse to music of any description: to Wilhelm von Humboldt music was unbearable; Alexander held it to be a "calamité sociale."

In Paris, after his return from South America, Humboldt's comprehensive and varied occupations were only possible with the most rigid allotment and utilization of time; and throughout his later life the same daily rule and punctuality were maintained. He rose early, at eight o'clock went into Paris to an "impenetrable inner chamber of my friend Arago in the basement of the Institute," to write or study there; at twelve he breakfasted; then continued his labours till seven o'clock, dined, visited the salons of his friends till midnight, always a centre of attraction and entertaining and lively conversation; and afterwards again wrote or studied till two o'clock in the morning. Most frequently he chose out of the way houses, in order to be as little disturbed as possible. Towards young aspirants in science Humboldt was especially gracious, and very many stories of his practical goodwill are related.

A vivid picture of Humboldt in his later life in Berlin is given by Bayard Taylor, an American traveller, who visited him in November, 1856. Of Humboldt's personal appearance, which is scarcely touched upon in other parts of the biography, he says:—"The first impression which Humboldt's features makes is that of a great and warm humanity. His massive brow, laden with the accumulated knowledge of almost a century, inclines forward and shades his breast like a ripe ear of corn; yet when one looks beneath it one meets a pair of clear blue eyes, of the innocence and mirth of a child's; out of these eyes speak the truth-loving nature of the man, the undying youth of the heart. . . . The first look begets confidence, and one feels that he will confide in us if we are worthy of his trust. I had approached with a naturally distant feeling of reverence, but in five minutes I felt that I loved him, and that I could speak as freely as with a friend of my own age. . . He thought as he spoke—without trouble. I might compare his nature to the fountain of Vaucluse, or to a calm lake outflowing in a deep river."

In several of the essays of the concluding volume, which treat of the branches of science that Humboldt's labours tended to illustrate and extend, a half apology is made at their outset that Humboldt's knowledge of a special subject was not such as would compare with that of one or other of his contemporaries whose life had been devoted to one particular science. This is very readily understood, for the "system of the world" which Humboldt conceived embraced in its grasp every branch of learning and every science—a scheme far beyond the powers of any human mind to work out; but at the same time it may be affirmed with confidence that no man has surpassed Humboldt in the reach and variety of acquirements which he brought to bear on his vast study of the harmony of the universe.

KEITH JOHNSTON.

## Notes on Scientific Work.

### Geology.

**Footprints in Carboniferous Rocks.**—Principal Dawson has described (*Amer. Jour. of Science*, January, 1873, 16) some footprints which occur in great abundance in dark coloured flagstones of the millstone grit at McKay's Head, Nova Scotia. These he refers to the genera *Protichnites*, Owen, *Rusichnites*, *Diplichnites*, and *Rabdichnites*, Dawson, and *Arenicolites*, Salter. Of *Protichnites* two species are described, *P. Carbonarius* and *Acadicus*. The former appear to have been produced by a small animal allied to the *Limulus*. Like its ancestors in the Silurian, it has left no trace of the edges of the carapace, but some very distinct impressions of a sharp pointed tail, and of several pairs of sharp pointed walking feet, the posterior feet having three or four toes. On the same slabs occur series of impressions with no tail-marks, and tail-marks with but traces of those of the toes. The imprints *P. Acadicus* from the Lower Carboniferous at Horton Bluff were apparently produced by a pair of flat organs, crenated at the edges. No remains of the animals themselves have yet been found. Many of the cylindrical markings which have been described as plants under the names *Palæochorda*, *Buthotrephis*, *Palæophycus*, *Anthrophycus*, &c., are believed by the author to be worm-burrows, and referred to *Arenicolites*, specimens from the Primordial and Carboniferous rocks having suggested to him an explanation of their branching or radiate characters. They present a central burrow from which the creature probably extended and withdrew its body in several directions. To *Diplichnites* and *Rabdichnites* are attributed markings probably produced by the pectoral or ventral fins of fishes armed with spines. To the latter he refers the *Eophyton*, Torell, from the Primordial, and considers that, as fish remains are unknown in these beds, they may have been caused by the feet or spinous tails of swimming crustaceans.

**The Oolites of Northamptonshire.**—In a paper communicated to the Geological Society on February 5th, Mr. Sharp shows that the "Lincolnshire Limestone" of Mr. Judd, which occurs between Kettering and Stamford, and traverses Rutland and Lincolnshire to Yorkshire, and which, being sometimes oolitic in structure, has hitherto been confounded with the Great Oolite Limestone, is really distinct from it, and belongs to the Inferior Oolite. Between Northampton and Kettering the Great Oolite Limestone in the surface rock and sections between these points exhibit the following order of beds:—

Great Oolite	Limestone	
" "	Upper Estuarine Clays	
Inferior Oolite	Lower Estuarine Beds	} Northampton Sands
" "	Ferruginous Beds	
Upper Lias	Clay	

On the eastern escarpment of the Ise valley, one mile east of Kettering, the Lincolnshire Limestone makes its appearance as a thin bed in the following section:—

Great Oolite	Limestone	
" "	Upper Estuarine Clays	
Inferior Oolite	Lincolnshire Limestone	
" "	Lower Estuarine Beds	} Northampton Sands
" "	Ferruginous Beds	
Upper Lias	Clay	

This is repeated on the western escarpment and in numerous other instances, with the occasional addition of the Great Oolite Clay, in other escarpments in Northampton and the above-mentioned counties. At Weldon the limestone has a thickness of about 30 feet, but thins out very rapidly to the eastward, and is not met with in the Nene escarpment at Oundle. Palæontological, as well as stratigraphical evidence goes to prove that the "Lincolnshire Limestone" belongs to the series of the Inferior Oolites.

**A New Sub-Class of Fossil Birds.**—Prof. Marsh points out (*Amer. Jour. of Science*, February, 1873, 161) some further remarkable characteristics in the fossil birds with biconcave vertebrae from the Kansas Cretaceous Shale. The *Ichthyornis dispar*, Marsh, possesses numerous small, well-developed teeth, implanted in sockets in both jaws, and inclined more or less backwards. There are twenty in each ramus, the maxillary appearing to have contained about the same number. The skull is of moderate size, and the lower jaws long and slender, and apparently not encased in a horny sheath. The bones of the wings and legs are of ornithic type, the bones of the posterior extremities resembling those of swimming birds. Mr. Marsh proposes to establish a new sub-class *Odontornithes*, or *Aves Dentate*, for the reception of these animals, the order receiving the name *Ichthyornidae*. He suggests that the *Archæopteryx* likewise had teeth and biconcave vertebrae; the elongated tail of that bird however serves to distinguish it from the *Ichthyornidae*.

**Mammals of the order Dinocerata.**—The Museum of Yale College possesses specimens of the remains of many individuals of animals of the order *Dinocerata* from the Eocene beds of Wyoming, and amongst them a very complete skull of the species *Dinoceras mirabilis*, Marsh. The remarkable cranial characters exhibited by this specimen, and the erroneous views which have been promulgated relative to the osseous

structure of this group of large mammals have induced Prof. Marsh to print a short description of their prominent peculiarities, preliminary to a fuller one which is in preparation. The skull is long and narrow, supporting three separate pairs of horns rising successively above each other, those of the posterior being supported on an enormous crest constituted by the great development of the supraoccipital, with the parietal and frontal bones. This crest descends rapidly in front of these horns, and concludes nearly over the centre of the orbit. The maxillaries, which are very massive, support the second pair. These cores are conical, their summits being obtuse and round, those of the posterior being transversely flattened towards the top as if the horns had been expanded and perhaps branched. Below are the huge canine teeth, resembling those of the walrus, the extremity of the fang being implanted in the base of the horn core. Moreover the maxillaries contain six small premolar and molar teeth, and near the end of the nasal bones there is a pair of low tubercles which support "dermal horns." The horn cores are all solid and smooth, giving no indications of a burr. Several parts of the skeleton resemble in a remarkable degree that of the Proboscidea, but exhibit the following distinctive characters: 1. The absence of upper incisors. 2. The presence of canines. 3. The presence of horns. 4. The absence of large air cavities in the skull. 5. The malar bone forms the anterior portion of the zygomatic arch. 6. The presence of large postglenoid processes. 7. A large perforated lachrymal, forming the anterior portion of the orbit. 8. A small and horizontal narial orifice. 9. Greatly elongated nasal bones. 10. The premaxillaries do not meet the frontals. 11. The lateral and posterior cranial crests. 12. The very small molar teeth, and their vertical replacement. 13. The small lower-jaw. 14. The articulation of the astragalus with both the navicular and cuboid bones. 15. The absence of a true proboscis. These extraordinary animals were equal in size to the elephant. (*Amer. Jour. of Science*, February, 1873 117.)

M. Munier-Chalmas announces (*Revue Scientifique*, 15th February), that he has discovered in the eocene travertine of Sézanne a species of *Vitis* similar to certain varieties of the cultivated vine, but more nearly resembling two exotic species, the Asiatic *Vitis persica* and the American *Vitis riparia*. It will be described in a work, now in preparation by M. Comu and himself, on the flora and fauna of Sézanne.

In the current number of the *Zeitschrift der deutschen geologischen Gesellschaft* (Band xxiv., heft 3) Prof. Gustav Rose corrects an important error which occurs in *Kosmos*. In Band iv., page 468, appears his classification of the trachytes, founded on the enclosed crystals observed in each variety, and drawn up in 1852 for Humboldt's use. He arranged these rocks in four classes, to which a fifth and sixth, including the dolerites and leucitic porphyry, were added by the author of *Kosmos*. These are to be struck out. At a meeting of the Society, the proceedings of which appear in the same part of the *Zeitschrift*, Prof. Virchow exhibited a human skull of the more rare brachycephalic form, found at Dömitz in a bed of brown coal and fish remains, at a depth of 28 feet, or 20 feet below low-water of the Elbe. He considers it the oldest prehistoric skull which has been found in North Germany.

At the anniversary meeting of the Geological Society the Wollaston Gold Medal was awarded to Sir Philip Egerton, and, on the first occasion of its being conferred, the Murchison bronze medal to Mr. W. Davies, of the Geological Department, British Museum.

### Physiology.

**Structure of the Nerve-Elements in Gasteropoda.**—Mr. Solbrig has just published an elaborate essay on the histology of the nervous system of the Gasteropoda, and gives the following as the conclusions at which he has arrived:—1. The ganglion-cells very rarely possess a proper membrane; that of the nucleus, on the other hand, is easily demonstrable. 2. The cell substance consists of an albuminous material, through which granules of various size are distributed, sometimes apparently irregularly, sometimes with a certain amount of regularity, so that after the application of certain re-agents, they present a tendency to concentric striation. 3. There are no apolar ganglion-cells in Gasteropoda. 4. Most of the cells possess a single process, or are unipolar; bipolar and multipolar cells are comparatively rare, the proportion of the latter to the former being as one to eight. Of the unipolar cells those predominate the diameters of which do not exceed one ten-thousandth of a millimeter. 5. The cell processes either run directly into a nerve fibre or undergo previous division. In the latter case they either give off several branches which do not further divide, or the division is continued again and again till they become immeasurably fine. Fibres are occasionally met with, which after a short course break up into a brush of fibres. From each of the above kinds of fibres delicate fibrils may be given off. 6. In no instance was the anastomosis, or junction of two adjoining cells by a direct branch, observed by the author. 7. The cell substance, in passing into a fibre, becomes gradually attenuated, or, in other words, the fibres arise from the cells by a conical process. In some of the bipolar cells fine striæ run to the nucleus and nucleoli. 8. The nerve fibres of gasteropods have no sheath of schwann. 9. No

differentiation of the fibre into nerve medulla and axis cylinder can be detected. 10. The nerve fibres are as a whole comparable to the axis cylinder of the nerve fibres of vertebrata having the appearance of a homogeneous band in which no fibrillation is in the fresh state visible. 11. The passage of the processes of the cells into nerve fibres takes place either directly, in which case the fibres arise both from the cell substance and the nucleus of the cell, or indirectly, and in this instance true primitive fibres spring from an intermediate granulo-fibrous tissue, in which the cell processes undergo extremely minute subdivision.

**The Mode of Termination of Sensory Nerves.**—In a paper contained in the *Rendiconti del R. Istituto Lombardo* (Vol. v.) M. E. Sertoli states that he has examined the tactile hairs of the dog and horse by the chloride of gold method, and found that in longitudinal sections of the tactile hairs very numerous dark violet-coloured nucleated bodies of irregular stellate or conical form occur between the columnar cells, which form the outer layer of the external root-sheath. These bodies give off fibrous and frequently varicose processes, which anastomose with each other, so as to form a kind of plexus, in each of the meshes of which from two to four of the columnar cells of the external root-sheath are enclosed. M. Sertoli compares these cells with those found by Langerhans in the stratum malpighii of the skin of man, though they differ from them not inconsiderably in number, position, form, and size. In the upper half of the hair follicle, however, smaller stellate corpuscles occur, which closely correspond with those described by Langerhans and Eberth. Sertoli has succeeded in tracing nerves directly into the larger bodies, situated in the external root-sheath; as yet he has only observed them in the tactile hairs of the horse. Sertoli has never been able to discover nerves in the papilla of the hair.

**Peptic Action of the Pyloric Glands.**—Considerable difference of opinion exists among physiologists in regard to the activity of the secretion formed by the glands of the pyloric region of the stomach. Fick and Friedinger on the one side consider that this secretion has no digestive properties, whilst Ebstein and Grützner maintain that it possesses in a very high degree the power of converting albumen into peptones. V. Wittich has just published, in the last part of Pflüger's *Archiv*, (1873, 1) the results of his investigations, which coincide with those of Fick. V. Wittich does not think the weight of albumen dissolved can be taken as a measure of the amount of pepsin in the fluid, since a disproportionately small quantity of pepsin will dissolve a large amount of albumen. He is rather disposed to seek in a comparison of the rapidity of action, a means of estimating the amount of pepsin present, the temperature and other conditions being the same in all cases. His experiments performed on pigs and rabbits have satisfied him that in these animals at least the pyloric glands furnish no pepsin.

**Amount of Nitrogen in Muscle.**—S. L. Schenk in his anatomico-physiological observations—has made some experiments on the proportion of nitrogen contained in flesh, a subject of considerable importance in experiments bearing upon the general nutrition of the body. He finds that the amount varies with the quantity of water, or the succulency of the tissue, the amount of fat which it contains, and the quantity of connective tissue that is mingled with the muscle. The first two factors can be readily removed by drying and maceration with ether, but the third is not easy to estimate or remove. When present in considerable quantity it largely increases the amount of nitrogen apparently contained in the flesh, for from experiments made on connective tissue taken from the fasciæ of muscles, from the periosteum of long bones, from the pericardium, and the external coat of the arteries, and from the mesentery, he finds that the amount of nitrogen is no less than 5 per cent, and in muscle rich in connective tissue 3.76 and 3.92 per cent. These numbers considerably exceed Voit's average of 3.4 per cent., and would lead to erroneous conclusions in regard to its value as an article of diet.

**The Effect of Suppressing the Excretion of the Skin.**—It is well known that if a rabbit or other small animal be shaved, and the skin be painted over with some material impervious to gases or vapours, death will soon ensue. The subject has recently been investigated by M. N. Socoloff, at Prof. Botkin's Laboratory, in St. Petersburg, and he gives the following of the results he has obtained in a provisional communication to the *Centralblatt für die medicinische Wissenschaften* (1872, No. 44):—1. A few hours before death the animals experimented on exhibited clonic or intermittent, and tetanic or persistent cramps and convulsions in various groups of muscles, whilst the temperature in the rectum fell to a considerable extent. 2. Even wrapping the animal in cotton wool failed to produce any material increase in the temperature of the intestine, or delay death. 3. Inhalation of oxygen was equally powerless in preserving life. 4. Ulcers arising from deep-seated extravasations were found in the stomach. 5. Albumen made its appearance in the urine shortly after the animal had been varnished. 6. Some of the animals were covered with inert substances, like gelatine and gum, while others were painted with a varnish of asphalt in oil of turpentine; in all cases diffuse parenchymatous inflammation of the kidneys was observed, sometimes accompanied by enlargement of the cell elements, and sometimes by fatty degeneration of them.

## Botany.

**The Fertilization of Grasses.**—Hildebrand has published an important paper on an exceedingly careful series of observations on this subject in the *Monatsbericht der Akad. der Wissenschaften zu Berlin* for September and October, 1872. The agent of fertilization in all grasses, except those few the flowers of which never open, is the wind; insects appear to play no part in it. With this object the pollen grains are very fine-grained and smooth, so that they are at once dispersed by a breath of air; the filaments are usually not stiff, but versatile, and the stigma is either feathery or otherwise presents a large surface with numerous indentations, in which the pollen is easily lodged. These contrivances render cross-fertilization inevitable; and while self-fertilization is in most cases not absolutely prevented, it is generally rendered very difficult. Previous observers had considered that self-fertilization must take place, because they had, in a large number of cases, never observed the flower open; this arose, however, from a want of close observation, the fact being that the flower does almost invariably open, but often remains so only for a very short time, and frequently only at a particular period of the day, which varies in different species. The weather also appears to exercise a very marked influence on the mode of fertilization in grasses; many species which are ordinarily self-fertilized never opening their flowers when the weather is cold and rainy, and being in such circumstances necessarily self-fertilized. Hildebrand then takes up in detail the various modifications of the sexual organs found in grasses. Dioecious grasses are very rare, the only certainly known kinds being two species of *Spinifex*, described by Engelm. in America. Monoecious grasses are more common, the relative positions of the male and female flowers presenting interesting differences; there are also a number of polygamous species. Of grasses with hermaphrodite flowers, a few are protogynous and hence necessarily cross-fertilized; and among these is the sweet vernal grass *Anthoxanthum odoratum*. In by far the larger number of grasses, however, the male and female organs are developed at the same time, and special contrivances are displayed for ensuring cross-fertilization. In the rye *Secale cereale*, the position of the organs is such that a part of the pollen from one flower must almost necessarily fall on the stigma of another flower. In the wheat each separate flower remains open only for an extremely short time, the glumes separate from one another suddenly, the anthers immediately protruding, and at once opening and discharging the whole of their pollen, only about one-third of their pollen falling on the stigma of its own flower, the remainder being dispersed through the air, and the whole of this process not occupying more than half a minute. In most of these cases the stigma remains receptive only for a very short period, and then dies, while in others the stigma remains in a receptive condition till long after the anthers have dropped off, and then must necessarily be open to the access of foreign pollen. In comparatively few cases the natural contrivances appear to favour self- rather than cross-fertilization; this is the case in *Avena sativa* and *Hordeum vulgare*; in both these cases the majority of the flowers never open, and are therefore necessarily self-fertilized; there appear, however, in almost all cases to be a small number of flowers, often arranged in one or two separate rows, which do open, and therefore may introduce occasional cross-fertilization. It is probable that the same species behaves differently in relation to its arrangements for fertilization under different circumstances of climate, while species very nearly related to one another exhibit phenomena which offer a marked contrast.

**Flora of Europe during the Upper Eocene.**—The Count de Saporta has given in the *Annales des Sciences Naturelles* for September, 1872, a critical view of the state of our knowledge of this period of fossil botany with more especial reference to the materials derived from the gypseous beds of Aix in Provence. He expresses with perfect justice a strong opinion as to the unsoundness of the methods pursued by many industrious workers in this subject. Their determinations seem to have been checked by no feeling of responsibility, and to have been guided merely by individual caprice. Fragmentary remains have been referred to genera on analogical grounds so slight that it is impossible to seize their bearing. He maintains as an essential condition for arriving at sound conclusions that the ancient flora must be studied in regard to its continuity with the flora of the present time. The relationship of the tertiary vegetation of Europe with that now existing in other countries is becoming intelligible. Its relations in different directions, while varying from period to period, lie within an area of which it will be possible in the future to assign the limits at any given epoch. Indeed in certain cases this can already be done.

Eocene Europe was a tropical country as much *sui generis* as Central Africa or the Indian Archipelago. To restore the elements of its vegetative physiognomy we must go to regions which have been less influenced than Europe has been by change of climate, and which consequently have preserved plants which it has lost. From what the frontiers retain it will be possible to reconstruct the flora of the central area. But De Saporta justly condemns the attempt to identify in Europe types of vegetation belonging to regions extremely distant from the centre. To introduce into it *Melastomaceæ*, the antarctic beeches,

and the Australian *Epacris*—as Unger has done on the strength of a single inconclusive leaf—is to wantonly risk the reputation of a branch of science with a great future before it. Fortunately the process has sometimes brought its own refutation; two plants described by Unger from Radoboj—one being referred to a tropical American genus—were proved by an Aix specimen to be parts of one and the same plant, having a quite different affinity. As to identifications with Australian plants, De Saporta believes that the vegetation of Australia has persisted from a remote antiquity with little change, and that the eocene European flora exhibited a certain parallelism without implying that it was derived. Mr. Benthams, from an examination of the whole question, believes that the possession by many eocene leaves of a general character which is now “more frequent in Australia than elsewhere,” proves, “not any genetic affinity with Australian races, but some similarity of causes producing similarity of adaptive characters. (Address, Linn. Soc., 1870, p. 17.) De Saporta accepts the *Proteacea*, from Aix, though none appear to be indubitable determinations.

A new source of error in fossil botany is confessed with laudable frankness. An ingenious person employed himself in imprinting leaves with a greasy ink upon pieces of stone which were afterwards etched with an acid. This brought out the nervation and outline of the leaf with a brown colour and in slight relief. De Saporta named ten such specimens, which he now of course withdraws. He declares that the forgeries are easily to be detected. It is to be hoped that this is so; the method certainly looks as if it would be dangerously successful. There is a perverse malignity in adding fresh pitfalls to a subject in which Nature has already done her best to baffle. These forgeries afford a curious test of the value of the interpretations, and it must be admitted that they show no very serious error except in the case—intelligible enough—where a species of maple was fronded on the impression of a small vine-leaf.

The fossil flora of Aix numbers 250 species—Monocotyledons and Dicotyledons bearing about the same proportion as at the present. The vegetation was principally arborescent, with few herbaceous species, and if one may judge from negative evidence like that of Borneo, it was poor in *Compositæ*. The principal families were such as characterize tropical vegetation, especially Indian—*Ebenaceæ*, *Anacardiaceæ*, *Sapindaceæ*, *Stenocaulaceæ*, *Leguminales*, &c. The affinities of the ancient gypseous vegetation in respect of generic types, general facies, and composition with that of India and the Indian Archipelago, China, the Philippines, and Japan at the present day are in perfect accordance with the theory that these regions formed the shores of an ancient nummulitic sea, extending from Morocco to Japan, and entirely comprised in the tropical zone of the eocene world, which extended to the 35th parallel. Besides its relation to South Eastern Asia, the Aix flora exhibits, according to De Saporta, a strong affinity with that of Africa, lying between Abyssinia and the Cape.

After the end of the eocene, European climate gradually became more severe. The flora of Eningen, belonging to the upper miocene, is only sub-tropical. Some sub-tropical forms still lingered on into the lower pliocene, as we know from the neighbourhood of Lyons.

As to the annual distribution of climate, De Saporta follows the example of Heer with regard to Eningen, and deduces with more ingenuity than certainty, an alternation of dry and rainy seasons, during the first of which trees cast their foliage as they do now during winter with us, but from a different cause, namely cold.

## History.

*Letters and Life of Francis Bacon*. By James Spedding. Vol. VI. London: Longmans. 1872.

"HONOUR," says Lord Bacon, in those Essays which so thoroughly give the outline and proportions of his own mind and character, "hath three things in it; the vantage ground to do good; the approach to kings and principal persons; the raising of a man's own fortunes." The great philosopher's climax will perhaps supply the key to the line of action taken by him in public affairs during that section of his life which, beginning in July, 1616, and closing with the year 1618, is the subject matter of Mr. Spedding's sixth volume. Opening with the rise of Villiers to the peerage, it follows the upward course of Bacon's own fortunes in sequence to those of the favourite. On March 7th, 1616-7, Bacon received the Great Seal with the title of Lord Keeper, a title exchanged for the higher rank of Chancellor in the following January at a great banquet given by Buckingham on the occasion of having himself received his patent of Marquis as a new year's gift from James. In July, 1618, Bacon was created Baron Verulam. This volume gives the history of the most prosperous and the busiest period of his career. Arrived at an eminence which afforded full scope for his unwearied industry and transcendent powers, he set himself to fulfil all the demands of his great place with the strong energy of a man to whom, as he himself justly says, "the duties of life are more than life." Not only this, but, small margin for other activity as the claims of that office, so strictly fulfilled, could have left him, one of the most valuable of his occasional works, his proposition for a digest of laws embracing the reform of the whole jurisprudence of England, belongs to the months between June, 1616, and March, 1616-7.

The leading events of English history, as well as those of Bacon's own biography, during this period are already so familiar that the points open to discussion in this volume mainly consist of the editor's own views of a series of well-known facts, with the light in which those facts are set under his comments. As examples of Mr. Spedding's treatment in this kind we may select the remarks upon the Spanish Match, those upon the execution of Raleigh, and the explanations offered touching Bacon's personal relations towards James and Buckingham during the time that he held the Great Seal. The first question, that of the Spanish Marriage, is handled with that consummate ability which we might expect from a writer who has given such ample proof that he possesses in a high degree the necessary qualifications for a task so difficult as a special monograph of Bacon. We may add that here, as elsewhere, in his justification of the Lord Keeper's conduct, not only has Mr. Spedding hit upon the very arguments with which the great lawyer might himself have defended both that piece of State policy, and his own

action in veering round to sanction it, but that his conclusions are drawn with a force and dexterity which may suggest Bacon's own powers of special pleading as reflecting themselves in his biographer. Only, were the conditions propounded by Mr. Spedding as favourable to the Spanish Marriage at all possible in that age, as they might be possible in our own? For what was the real situation? James had from the outset of his reign set himself up before the eyes of Europe as the mainstay and pillar of Protestantism. So far as words went, the King of England stood out as the champion of Lutheranism in Germany, giving proof of his sincerity by a tyrannical anti-Catholic policy in Ireland, by enforcing drastic penal laws against English Catholics in violation of his promises made before he came to the throne. Spain, on the other hand, was not only a great Catholic power, but informed with a spirit ardently militant and propagandist; her sovereign pledged equally by strong religious feeling and close family ties to help forward the Catholic reaction in Germany then organizing under Ferdinand of Austria and Maximilian of Bavaria. In view of these circumstances could a close alliance between the royal houses of England and Spain have been anything better than a monstrous paradox, at once revolting to common-sense and disparaging to the honour of this country? Although in the national resistance to the Spanish Marriage there was doubtless a strong infusion of unreasoning fanaticism, there was also at bottom a strong and wholesome sense of national honour. Even had the amount of religious toleration such an alliance involved been reciprocal, the English people could hardly have borne it. But, its rejection being certain, no demand for equal toleration was made to the Court of Madrid. Other grounds for dissatisfaction apart, this in itself would have involved the King, had he actually carried out his purpose, in endless and hopeless complications with his subjects. Fact-proof in his supreme wisdom, Bacon's master was entirely blind to signs of the times which would have been easily interpreted by any clear-sighted statesman. Bacon himself was not blind. At first he had openly condemned the project, and had honestly expressed his sentiments to the King. But afterwards, when James, anxious to secure the dowry, showed himself bent upon its accomplishment, and formally submitted the scheme to a chosen number of councillors of whom the Attorney-General was one, deliberately quashing his personal scruples, he became an active and useful instrument of the royal pleasure. As we have said, Mr. Spedding's defence of this inconsistency is most carefully elaborated. But unfortunately the effect of the editor's justification is considerably marred by a paragraph immediately following it, which reads like a revelation of the true cause for Bacon's change of tactics:—

"The part which he took in this deliberation (a conference of the Commissioners for the Marriage, March 7th, 1616-7) was probably his last service as Attorney-General. On the 5th of March, the Lord Chancellor, who had long been begging to be relieved from the cares of office, succeeded at last in inducing the King to accept his resignation. He was allowed to deliver up the Great Seal on the 6th, and on the 7th it was given, with the title of Lord Keeper, to Bacon." P. 151.

Here we see Bacon at last grasping the splendid prize, on which doubtless his heart had long been set. That prize was his by just right. Great learning, legal acuteness, and splendid genius—all these qualities constituted him the man in the whole kingdom best fitted for that office. And yet the question presents itself; Would a servant of James who had dared to cross any cherished plan of his master's have achieved that elevation solely in right of high qualifications; would the Great Seal at that particular juncture have passed into Bacon's hands had he not shown himself servilely willing

to sacrifice on a great political question both his personal honour and the honour of England?

Upon another point, that of the necessity for Raleigh's execution, Mr. Spedding's exhaustive and masterly summary of the facts should, we think, close all controversy. With our present knowledge of the circumstances it is clear that Raleigh was guilty of freebooting, and that, being guilty, his punishment was by the law of nations a righteous act. Mr. Spedding appears anxious to clear the King in this unfortunate business, and holds him blameworthy only in refusing, against the advice of his Council, to let proceedings against Raleigh be taken in a court thrown open, partially at least, to the public. Mr. Gardiner, on the other hand, strongly insists upon the King's culpability in countenancing an enterprise which might bring on hostilities with Spain without having procured trustworthy information respecting the course of Spanish colonization in Guiana. This charge Mr. Spedding passes over in silence, contenting himself with criticising a hyperbolic phrase employed by Mr. Gardiner. Again, too, can James be any way justified in the matter of granting a dangerous commission to a convicted traitor—a man in the eye of the law civilly dead? Had the King, acting with common-sense and common generosity, granted Raleigh a free pardon before despatching him in quest of a gold mine, the issue of the affair might have been less deplorable. He could then have been legally put upon his trial for the outrage committed at St. Thomé, and the people would have acquiesced in his execution as an act of justice. But, blunderingly as the matter was conducted, could Raleigh have seemed to them other than a great and brave Englishman brought to the block through a machinery of legal fence and quibble, and this solely in propitiation of a detested foreign power? Much of Mr. Spedding's ingenious and elaborate argument for James's Government leads up to a vindication of the famous despatch after Raleigh's execution, charging the English ambassador at Madrid to let the Spaniards know that, able man as Raleigh was "to have done his Majesty service, if he should have been pleased to employ him"; yet to give them content he hath not spared him, when by preserving him, he might have given great satisfaction to his subjects, and had at his command as useful a man as served any prince in Christendom." Words like these, we venture to think, stand out from editorial comments in open and honest distinctness. They offer their own "true and natural interpretation," and refuse to be read in any other light. That letter, which has stirred the indignation of all English historians of the transaction, surely goes far to justify the bitter popular feeling at the time. If mere justice were dealt to a criminal, what need for this abject protest; if complaisance to a foreign power did really help on the catastrophe, in Raleigh's death, however justifiable in itself, was not the honour and dignity of England actually prostrated to the vengeance of Spain? It is noteworthy that Bacon, who took the chief part in framing the Declaration put forth by Government to justify the execution, has in his correspondence during Raleigh's trial kept strict silence upon the matter.

Bacon's conception of the "approach to kings and principal persons" as an essential component of honour is illustrated in mournful wise by his own correspondence with James and the favourite—a set of letters which, taken as a whole, irresistibly bring to mind the verdict passed upon the political correspondence of a great ancient,—one who, like our great modern, so completely fascinates the imagination through the splendour of his intellect that we can hardly accept him as the adroit flatterer and slippery statesman which stands revealed in his political letters. What has been said of Cicero justly applies to Bacon: had

that part of his correspondence been reduced to tinder, the loss to posterity would have been so much gain to his reputation. Never surely was terse and compact English, with a native elevation of style, put to such servile use as by James's Lord Keeper. Flattery was perhaps inevitable; no man could have approached the King without paying tribute in that base but current coin of the age. But these letters betray a meanness of spirit which goes deeper than formal complaisance. They give the terms upon which Bacon was willing to keep Court favour; when, too, he had happened to take the wrong side in Coke's matrimonial quarrel and that favour was in consequence withdrawn, they exhibit him suing for its recovery with abject and slavish submission; they reveal him straining his legal dexterity to the utmost for the purpose of enriching the favourite and the favourite's creatures; they show him in so flagrant a matter as Mompesson's monopoly-patent making no stand whatever against an enormous abuse, but only anxious to secure himself against undivided blame by procuring that it should "pass other judgments than his own." But the dishonour culminates in that portion of the correspondence which throws light upon what Mr. Spedding mildly terms "Buckingham's bad habit" of tampering with Bacon's decisions in his own Court of Chancery. The Chancellor had surely enough worldly sagacity to know how pernicious must be the constant interference of an omnipotent minister of the Crown in causes actually under legal discussion; to know that in being subjected to such interference not only was his judicial position dangerously compromised, but that his judicial integrity might at any time give way under too strong a pressure. To enlighten him upon this article of professional ethics he surely stood in no need of a code either of official honour or of personal morality in advance of his age. To us it seems that he yielded on so vital a point as he yielded on others, simply because only at that price could he keep Court favour; because only through that favour, and not through his high personal merits, could he hold the "vantage ground to do good" in public service of his country which he sincerely loved, and other things which it is to be feared he loved as well, if not better—office with its train of show and glitter, its "much ado and a great deal of world," which he mentions so complacently to Buckingham; those riches of which he has elsewhere written in the fulness of his own sad experience that they are the *impedimenta* and hindrances to virtue. After all, with all his compliances, it is doubtful whether Bacon even in these years of his life, when outwardly he stands high in his master's goodwill, had in reality achieved more than a hollow and heartless show of royal favour. Signs are not wanting here, though we have not space to point them out, that James, while he availed himself of his Chancellor's genius, secretly recoiled from it in that mingled disturbance and irritation which, as Coleridge finely remarks, contact with genius excites in natures too mean and too self-centred to be capable of true homage before it. This, we think, will explain the King's frequent attitude of self-assertion; the barely concealed jealousy which prompts him to thwart Bacon at every turn with his own petty and peddling interference, and, whenever occasion offers, his eager willingness to humble his illustrious servant.

Bacon's conception of honour is, as we have seen, purely material. It may be justly defined as worldly prosperity at its highest pitch. Montesquieu's ideal of honour in a servant of the Crown is, on the other hand, strictly ethical. He considers loyal and strict obedience to the Prince as one of its main elements. This proposition the English philosopher would doubtless have been ready to accept. But we question whether he would have as readily followed

the Frenchman when he insists upon the statesman's honour in a finer sense; that quality which taking, as he says, the form of high and heroic courage, withstands the commands of the sovereign whenever those commands clash with the supreme law of conscience and of personal integrity. For, after all that could fairly have been said in Bacon's behalf has been said by so able an advocate as Mr. Spedding, we must still hold that at the essence of his character there was a fatal incapacity for this fine sense of honour. More than one man among Bacon's predecessors in office had given signal examples of the virtue. Within his own century the Chancellor of Henry VIII., obeying its inspiration, had stripped himself of power and place, and so doing, left his name a glory on a dark page of English history; lacking that inspiration, the Chancellor of James I. set at barter against power and place the nobility of his own soul, and so doing, left his great name a focus for the meanness and the baseness of one of its most shameful pages.

GEORGE WARING.

Historical Sketches by J. H. Newman, D.D. 2 vols. Pickering, London. 1872.

DR. NEWMAN told us in the preface to his *Occasional Verses* that he included everything he had written because he found himself unable to estimate the comparative value of different pieces. Perhaps he would justify the publication of the present collection upon a similar principle, and it is certainly curious that such a wide diversity of positive substantial worth in the matter should co-exist with such an uniform excellence of manner. One great charm of Dr. Newman's writings is that he looks at all things by the same light—a light which he carries with him and holds as he pleases; the light is always clear and always pleasant to the eyes, but there is less certainty about the importance of the objects it shows and of the side (or corner) of them which it happens to fall upon. The result of this uncertainty is a sort of unreality; the writer's view is coherent and plausible, it might almost be said to be reasonably well established, and yet, taking it as a whole, it is more or less out of relation to the principal facts; sometimes it is not even inconsistent with them, it simply leaves them out. Perhaps the extremest instance of this is the series of papers on "Convocation," reprinted from the *British Magazine*. The writer is much more in earnest about the indecorum of priests resisting bishops than about the turpitude of bishops playing into the hands of a latitudinarian ministry; and when he comes to discuss the burning question of the relation of Convocation to the Crown, he winds up with the decision that the purely apostolical power of the Church is still intact—that in matters merely ecclesiastical she still exercises a concurrent jurisdiction, e.g., in the so-called Spiritual Courts, though it is an anomaly that the power of excommunication should rest with them, and consequently the writer has "no wish to contend that the existing state of the law is in every part as consistent as the theory of it is just." The fact is that when Dr. Newman had compiled a trustworthy account of the history of the quarrel he did not care to help his readers to understand the actual state of the question—he preferred to give them something which was safe and edifying for them as Churchmen to think about it. Again, the paper on "Mediæval Oxford" is beautifully written, but it is written exclusively in the interest of the thesis that Oxford is a "survival" from the Middle Ages, and if she is to be true to herself must always remain old-fashioned and appear behind-hand. Here of course there is some excuse for a *parti pris*, though we believe, as a matter of fact, that Laud's energetic organization of the university has had more to do with its

conservatism than the number of colleges which can be proved to be transformed or resuscitated monasteries. It is difficult to form any conclusion about the beautiful fragment on the "Northmen and Normans in England and Ireland," except that its incompleteness is a reason for regretting that the writer suddenly ceased to be editor of the *Rambler*. The parallel between Ireland and England as the most civilized portions of Christendom until they were attacked by the Northmen is very suggestive; it is founded on unquestionable data, but it leaves one large class of facts altogether in the background. We can hardly doubt that society in Gaul and the Rhineland was still much more highly organized than it was in England under the Heptarchy, when Alcuin was less illiterate than any man Charlemagne could find in his own dominions to preside over the School of the Palace. And it is surely a hazardous inference that Ireland as a whole was more civilized than England as a whole in the eleventh century because slaves were exported to Bristol from Ireland. Apprentices, who did not practically differ from slaves, and even political prisoners, were exported to the plantations in the seventeenth and even in the eighteenth century: does this prove that America and the West Indies were more civilized than England? And it might be a further question whether it is the most important point we want to know about the Norman conquests of both islands, whether the Holy See was justified in sanctioning them, though of course it is a fair point that if there was justification for either there was justification for both, and that of the two the Norman conquest of England produced far more immediate suffering than the Norman conquest of Ireland. But it is a one-sided statement that it was the Tudor, not the Plantagenet, that began the Iron Age of Ireland. No doubt up to the Reformation the natives were able to assimilate the conquerors, and afterwards they were only able to brutalize them; no doubt till then the Irish retained at least one privilege—their conquerors only made them miserable in ways that they could understand; but for all that they were miserable. The Burkes and the Geraldines and the rest were content to administer Irish institutions; but they administered them badly—the people had to support all the burdens of government, and they received hardly any of its benefits. There was a constant appeal to the English crown from the suffering Commons both English and Irish; they entreated, and always in vain, that the Lord Paramount would give them the benefit of law and order. Though the later conquests did far more to break down Irish civilization than to set up English; though the material development of even the English colony was seriously hampered by the jealousy of the mother country, it can hardly be doubted, if we compare the eighteenth century with the fifteenth, that relatively as well as positively the land had become less poor in becoming less Irish.

The greater part of the first volume is taken up with a reprint of the series of letters on university matters which appeared in the *Gazette* of the University of which Dr. Newman was rector when he wrote them, and were published in 1856 under the title of "Office and Work of Universities." The title has been altered in the present edition to "Rise and Progress of Universities," which the writer regards as more accurate; and perhaps it is as accurate a title as could be given to what is really a series of considerations drawn from the experience of all previous universities for the encouragement and guidance of the Catholic University of Dublin. The book contains a great deal of clear and brilliant writing; the best bit in it is the report which the agent of a London company might make if sent out to prospect in Attica. One idea runs through all the book, that the essence of an university is teachers who can attract learners; that

everything else—degrees, endowments, discipline, the collegiate system—is in a sense secondary; they may be necessary to the integrity of the university, to its well-being, but not to its being. This suggests more than one observation. The writer does not give nearly weight enough to the fact that universities were once a necessity of knowledge, and now are only a luxury. Knowledge can exist and increase without them, though an enthusiast might maintain that it can reach a more exquisite perfection in them than elsewhere. He seems to suppose it possible for universities to maintain themselves without material inducements of any kind; it was possible once—experience shows that it is not possible now. Again, the ideal relation between colleges and universities, between tutors and professors, is attractively sketched; but the writer stops short of the question, Who is to attend the professors' lectures if all students are to be members of colleges, prepared for their arts' degree by college tutors? It would be unreasonable to compare his account of the transformation of mediæval education with M. Rénan's in *Averrhoes et l'Averrhoïsme*, or to insist too much on the indistinctness with which he slurs over the contrasts which existed between the Athens of Socrates and the Athens of Cicero, and even between the Athens of Eunapius and the Athens of Proclus.

As might be expected from his position, Dr. Newman lays great stress on the action of the Holy See in fostering university education. The point he selects for special eulogy is the readiness of popes, among the most pressing embarrassments of the present, to provide for a distant future. No doubt they have always been ready to give such plans a thoughtful sanction; sometimes the initiative has been their own; in either case when the plans have succeeded their successors have always been there, and probably they always will be, to claim the credit of the success, and this of itself gives them a great advantage over other founders and benefactors; and the plans have succeeded quite often enough to make the characteristic an useful one, but it is certainly not a proof, to outsiders it is hardly a presumption of any supernatural insight in its possessors.

There is another instance of the same subjective way of looking at things in the very striking lecture on the "Pope and the Turk:" the perpetual appeal to Christendom against the Turk and the Turk only, not against the Saracen, not against the Tartar, kept up without intermission from St. Gregory VII. to St. Pius V., undeniably makes a subject for a very telling and impressive picture, and it need not be said that Dr. Newman treats it like a master. If we could regard it as exclusively addressed to Roman Catholics there would be nothing more to be said. Other readers have a right to remember that the Turks were the first Mahometan power which seriously impeded pilgrimage to the Holy Places, that afterwards they were the only Mahometan power which menaced the establishments of Western Christendom in the Levant, that the Popes preached many other Crusades, and that the Western powers tried the experiment fairly before they gave it up as too hard for their resources and their virtue, and lastly, that the Popes themselves were very far from making the Holy War the sole or the chief object of their administration.

The whole series of the lectures upon the Turks is at bottom simply a marvellous *tour de force*. The Crimean war had just made the Turks a subject of general thought, so Dr. Newman read up all the French and English authorities upon their history and their relation to Europe, compressed the result into a readable and intelligible form with a mastery less ostentatious than Gibbon's and hardly less astonishing, and proceeded to distil from the whole the maximum of sufficient reasons for thinking ill of them and

hardly wishing well to them. The main thesis of the book is that the Turks are a Tartar tribe who have intruded themselves into Europe, where as might be expected they have done nothing but mischief, and whence they will be certainly and justly expelled as irreclaimable barbarians. It would be unreasonable to complain of the writer for not recognizing that there has always been a comparatively sedentary population in Turkestan, and that Central Asia has never been wholly abandoned to Nomads. Still even if we assume that this population was purely Aryan, the Turkish race must have been much affected by intermarriages before they crossed the Oxus, and granting the Turks to have been pure Mongols it is probable that the mixture of race had more to do with the disappearance of their ugliness than even the delightful climate of Sogdiana. But the Turks were to bear the whole blame of the devastation of Greece and Asia Minor (and of the Danubian Principalities, where no Turk has ever settled), and accordingly their Tartar origin is insisted upon again and again. It is hardly necessary to point out that Greece was ruined before the Turks set foot in it, that even in Asia Minor the population had been thinned by Byzantine fiscal oppression, and by the excessive estates of the nobility, to say nothing of the desolating slave-hunts of the Caliphs, long before the invasion of Alp Arslan, and that Mr. Finlay is not alone in attributing the rapid progress of the Osmanlis under the first sultans to the fact that the peaceable and industrious population found it easier to thrive under their rule than under the decrepit despotism of the Palæologi. Again, it was certainly relevant to the writer's thesis that 2,500 Turks thought it quite natural in the sixteenth century to be routed by 500 musqueteers; but he should have remembered that in the fifteenth Mahomet the Second had had the most formidable artillery in Europe. And as the order of Janissaries had become hereditary long before their extinction, it is hard that Mahmoud should be charged by implication with the guilt of the apostacy of the victims of his massacres.

The essay on Cicero, which was written in haste for the *Encyclopædia Metropolitana* nearly fifty years ago, presents with a good deal of delicacy and feeling what were then the accepted facts about his life and writings; the most remarkable points about it are the decision with which his admiring biographer sacrifices his reputation as a statesman, and a passage in which the Latin language is appreciated with a somewhat extreme severity. The other article contributed to the *Encyclopædia*, on Apollonius of Tyana, treats his personality just fully enough to show that it was not written exclusively in support of the easy thesis that the romance of Philostorgius does not affect the credibility of the canonical gospels. The remainder of the volume is taken up with the polemical chapters of the Church of the Fathers here printed separately under the title "Primitive Christianity." They are vigorously written, and it is a triumph for the writer that their substance already seems hackneyed. The section on Jovinian and other pseudo-Protestants of the fourth century is amusing still. G. A. SIMCOX.

#### Intelligence.

M. Nasilievsky has published in the Russian Journal of the Ministry of Instruction a historical article on the relations between Byzantium and the Petchenegs.

The Annual of the Polish Society of History and Literature in Paris re-appears after an interval of three years. It is at present published by the house Zupanski, of Posen. Among other interesting matter it contains the correspondence of Stanislaus Augustus, from 1784 to 1792; and the correspondence of Joachim Lelewel with Charles Sienkiewicz.

One of the most interesting of recent publications relating to Slavonic history is that of the *Fontes Rerum Bohemicarum*. Three numbers have already appeared, containing the lives of the saints in the original

text with a translation in Bohemian. Of a similar character are the *Reliquie tabularum terræ regni Bohemia*, of which five numbers have appeared in quarto, and the *Regesta diplomatica nec non epistolaria Bohemia et Moravia*. Both these collections are edited by M. Emler, conservator of the archives of the city of Prague.

### Philology.

Thirteen Satires of Juvenal. With a Commentary by John E. B. Mayor, M.A., Fellow of St. John's College, Cambridge. Second edition, enlarged. Part II. London: Macmillan and Co. 1872. THE second part of the new edition of Mr. Mayor's Juvenal will be a disappointment to those who had looked forward to a continuation of the commentary on the same scale on which it was commenced. With the exhaustive note on Recitations which was begun in the first part, this style of commentary for the present ends, and though we are promised that the tenth satire shall be treated as fully as the first, yet the remainder of the notes are more on the scale of the first edition; and the whole work sinks back to the level of a school book, however excellent of its kind, instead of being the comprehensive commentary on the literature of the silver age for which we had been led to look. The critical notes are also deferred to a future edition, and we are for the most part left to conjecture the grounds on which Mr. Mayor has been led to deviate in many places from the readings of Jahn, whom he followed almost implicitly in his previous edition.

But yet this new issue is something better than a mere reprint. Besides the improvement in the text, which was

dwelt upon in a former number of the *Academy*, the present part bears constant marks of twenty years' diligence, in the study of the silver age; and in several places Mr. Mayor has boldly, and for the most part advantageously, changed his views about disputed passages. There will probably, for instance, be few scholars who may not learn something new from his fresh notes about the assumption of divine honours by the Emperor (Sat. iv., 71); on the semestris tribunatus (Sat. vii., 88); or on Bellona (Sat. iv., 124). On Sat. iii., 218, he happily lays aside his usual reticence about readings, and gives his reasons, supported by the weight of Mr. Munro's authority, for adopting Roth's conjecture, "*Phacasiatorum vetera ornamenta deorum*," as the most probable solution of the various readings of the MSS. It could have been wished that he had shown the same readiness to explain his reason for abandoning Ritter's conjecture, "*Discipulamque senex*," in v. 117 of the same satire, which he formerly maintained to be a necessary emendation: but such inconsistencies follow naturally on the undecided plan on which the book is composed. In Sat. v., 153—155, it is satisfactory to find that he not only gives up the somewhat prosaic view that Juvenal is speaking of a recruit learning drill from one Serjeant Capella, but that he has overcome the difficulty of understanding *ab capella*, instead of *ex capella*, to be "from a goat's back," by adducing two unquestionable parallels from no less authorities than Ovid and Propertius. On Sat. vii., 165, he resigns the reading, "*accipe, quid do*," of which he formerly gave a very forced and artificial rendering—in favour of the simpler "*quod do*;" though at the same time he quotes a novel and at least ingenious explanation of the harder reading suggested by Mr. Munro. On Sat. iv., 122, he gives a new view of the meaning of "*velaria*," as meaning not the awning itself, but "the upper part of the theatre or amphitheatre over which the awnings were stretched." Other passages might be quoted where the present is an improvement on the old edition, but it is not what it promised to be, and, even though it prove to be the best edition of the Satirist, it must yet be always an ill-proportioned book, too large for the requirements of the ordinary student, yet inadequate to satisfy the expectations which it began by holding out. J. R. KING.

### Intelligence.

The *Journal of the Royal Asiatic Society*, vol. vii., part 2, contains a description by Professor Wright of a Syriac translation of the famous *Kalilah v' Dimnah*, hitherto wholly unknown, and found in a MS. of the library of Trinity College, Dublin. The translation is made from one of the first redactions of the later Arabic. From the specimen given by Dr. Wright in Syriac and English, containing the story of the lion and the ox, and accompanied by interesting notes, it is evident that an edition of the entire work, which, we believe, this eminent Semitic scholar intends to publish, would be of much importance for Syriac lexicography, and no doubt also for the history of the Arabic translation of *Kalilah v' Dimnah*.

*Lettres assyriologiques, seconde série, par François Lenormant.* Paris: Maisonneuve. The new series of M. Lenormant's *Lettres* consists of two volumes, to be followed by a third, bearing the second title *Études accadiennes*. They contain a systematic exposition of Accadian grammar, which is at once full, able, and clear. The work will be most useful to cuneiform students, and we hope will be printed in a more readable form: lithographed handwriting is not pleasant to peruse. We would note that the postposition which answered to the Assyrian *cima* "like" was *tum* or *dim* in Accadian, not *gim*; and that one form of the substantive verb was *gal*, not *ik*, affording an instance of the interchange between *l* and *n*. We believe that the views expressed throughout the work are just and accurate; and it is with especial satisfaction that we find the author (p. 20) brought by the evidence of the bilingual grammatical tablets to say: "I must remark by the way that they justify Hincks against M. Oppert on the two essential points of controversy between these eminent scholars, the existence in Assyrian of a Permanent formed like the Preterite of the other Semitic languages, and of a Kal Present with the second radical doubled, that is almost exactly like

the Pael and differing only in the Vocalisation." Another scholar who had devoted his attention to the lexical and grammatical side of the monuments, the late Mr. Norris, had come also to the same conclusions. In a letter written shortly before his death, he says, "I have always believed in Hincks's Permissive, but do not like the name. I believe in a Future or Present tense used for either tense, the added *u* and *uni* making both indirect."—A. H. S.

Another of the great lexicographical enterprises of the Oxford University Press is making satisfactory progress towards completion. This is the Hebrew-Arabic dictionary of Ibn Janāh, edited by Ad. Neubauer, the first fasciculus of which is announced below. The sale of the Oxford Sanskrit-English dictionary by Prof. M. Williams is reported to have been so considerable, that the author is already meditating a new edition.

The deaths are announced of M. Stanislas Julien, the veteran Sinologue, and Prof. Julius Fürst, the Hebraist.

## General Literature.

**Biographical and Critical Essays.** By A. Hayward. (Second Series.) Longman & Co.

"To the merit of novelty," says the author in his preface, 'whether of facts or arguments, he can prefer but a very trifling claim. To compress scattered and curious information, and, if possible, to amuse, have been the primary objects of the author. The result is an agreeable addition to popular literature, containing a good deal that will be new as well as interesting to the class of readers for whose amusement he is in the habit of catering.' The author is Mr. Jesse, who has written some Memoirs of Richard III., and we have quoted Mr. Hayward's appreciation of them because it serves exactly to characterize the most prominent merit of his own two handsome volumes. Mr. Hayward goes on to say, "If the life of Richard was to be rewritten at all, the task should have been undertaken in a more serious and meditative mood, with a full sense of its responsibilities, and a keener insight into the complex causes of the strange notions of right and wrong, legality and illegality, which marked the period in dispute."

Since Mr. Hayward has reprinted his essays he cannot object to be judged by his own standard; and certainly, whatever their other merits, insight is not one of them, and we think a stronger sense of responsibility would have made them as thorough as they are clear, sober, accurate, and readable. For instance, if Sainte Beuve, who was a layman, had written on the author of the penal code of Louisiana, he would have been more careful to form an estimate of his rank and characteristics as a jurist than to reproduce his sensational argument against capital punishment, and his equally sensational placards for the cells of murderers; perhaps, too, he would have refrained, even in 1864, from sneers at American institutions many of which are already obsolete. We doubt again whether Sainte Beuve would have been content to re-issue an essay on Marie Antoinette printed in 1859 without making use of her authentic correspondence, which has been edited by Von Arneth in reply to the apocryphal letters to which M. Feuillet de Conches stood godfather, or whether he would have ever been content, if he spoke at all of the charge that she desired and

invited the invasion of France, to have spoken so vaguely and evasively as Mr. Hayward. As it stands the essay deals mostly with the scandal about her married life before the Revolution. Lord Holland, who was in a position to check Madame de Campan's narrative, said that her loyalty had made her disingenuous, and that in conversation she was comparatively frank. Lord Holland may have been mistaken, but Mr. Hayward fails to set aside his evidence by proving that there were people who derived an opposite impression from Madame de Campan's conversation; she may have been more or less unreserved at different times and to different persons.

The essay on Richard III. gives no intelligible impression of his character as a whole, but proves that Shakspeare followed More pretty closely (which would be more important if we knew whom More had to follow), and gives some picturesque details about the fight at Bosworth from Nicholl's edition of Hutton. That on the Countess of Albany and Alfieri tells all that most people would care to know about the *amour* from Von Reumont's book and St. Rene Taillandier's articles in the *Revue des deux Mondes*; admirers of Alfieri might complain that the depth of his passion was underrated.

Perhaps the most substantial thing in the book is the elaborate reply to Parkes' and Merivale's memoirs of Sir Philip Francis. Mr. Hayward leans to the theory that Earl Temple wrote or inspired the Junius Letters, and he reproduces in an appendix the letter which appeared in the *Times* a few days ago, giving the Lord Aberdeen's authority for Pitt's contradiction of the Francis theory. The principal arguments against that theory are very effectively stated. It is shown that if Francis was Junius he must have been something like a psychological monstrosity, a combination of cowardly temerity, fatuous mendacity, and motiveless malignity, and yet with all this that he contrived to thrive by subservience in his own name while posing as a model of grandiose independence under his *nom de plume*. It is shown also that of the numerous coincidences, which the advocates of that theory rely upon, many are indecisive and not a few apocryphal; more stress than it will bear is laid upon the fact that Francis affected dissipated habits and had plenty to do in the War Office. Gentz was dissipated, and wrote quite as elaborately as Junius in the fragments of his time.

The essays on Gentz and George Canning as a man of letters give a good deal of information pleasantly. They both suggest the reflection what a shabby, stupid business most of the resistance to Napoleon really was, though the *Tugend Bund* made it respectable in Germany for a year or two, and Wellington in the Peninsula for four or five. The haughtiest nobility in Europe were delighted to pay and pamper a dissipated sentimental pamphleteer (who to be sure was a very agreeable confidant) into an European personage because there was no one else who could make their case look plausible on paper; even the British aristocracy "keeping the continent at bay with their backs against the wall," as Mr. Henry Kingsley has it, were glad to fee him to get up their budgets for them. Compared with Gentz, Canning was one of themselves; his useful squibs and his connection with Pitt gave him a right to cultivate and display to the utmost his admirable talent for the highest eloquence of the best debating clubs; but it was only the intellectual poverty which drove them to Gentz that made it possible for Canning to force his way to the premiership, and even gave his party reason to regret that they managed to keep him out so long. Mr. Hayward is too good a Tory to make these reflections himself, but it was surely a needless concession to virtue to insist that Gentz would have been happier if he had been frugal enough to decline presents; of course it was foolish of him to play high, but to mortify his taste for cooks and carriages would have cost him more in the way of self-denial than he would ever have gained in the way of self-respect.

The point best worth noticing in the paper on Marshal Saxe is the discussion of the Battle of Fontenoy. Mr. Hayward hardly succeeds in refuting the Duke of Richelieu's story, which owes its currency to Voltaire, and is repeated by Mr. Carlyle; but he shows clearly that Marshal Saxe's story was accepted at the time by the King and everybody else; in short, we have the alternative of believing that the Duke of Richelieu's memory leant itself to some pardonable exaggeration of the part that he had played, or that Saxe less pardonably distorted all the official accounts of the battle. It is difficult to decide whether the essay on Dumas or that on Maria Edgeworth is the greatest service to the public; the first contains the cream of twenty-four volumes, the second contains the cream of three; but Dumas' memoirs are published, and Miss Edgeworth's are not. Again, in criticizing Dumas Mr. Hayward had only to bring the average opinion of his own generation into focus; in dealing with Miss Edgeworth he had to perform the same function for a generation which has passed away. In the latter case it would have increased our obligations to him if he had compared Miss Edgeworth's talent with Miss Austen's and Mrs. Gore's, neither of whom, though their strength was widely different, ever weighted it with such an enormous mass of copy-book morality.

The essay on Whist we fear will be mischievous. It contains many interesting anecdotes of the game, and a clear exposition of the long suit system, and a proof that it must be the foundation of all first-rate play; but the writer does not consider the disturbance which its universal adoption would produce among many estimable players who have been used to conduct an intelligible and interesting game on the principle of making their own and their partner's court cards and spoiling those of their enemies, to say nothing of the ulterior danger that under the long suit system whist among inferior players would become monotonous and mechanical. But perhaps Mr. Hayward is of opinion that here to owe cannot help entering upon a period of decadence; it may be that there are no first-rate whist-players under forty, as there are no first-rate poets, painters, or politicians. This lamentable observation occurs in the

paper on Sir Henry Holland's recollections, which leaves the impression that the reviewer liked and respected his author too much to let slip any opportunity for a bit of deferential sparring.

The articles which will have most permanent value are the short notices of Van de Weyer, Lord Lansdowne, Lady Palmerston, and Lord Dalling. The last contains some truly charming letters to the Princess of Lichtenstein, then Marie Fox, and the Countess de Puliga, then Henriette Sanson, and known by her success in private theatricals. Here are some remarks on marriage from a letter to the former:—

"Love, in its passionate meaning, is not required. I will give you a simile which I gathered from a water establishment. Apply a cold, not icy, piece of wet linen to your chest, and cover it nicely over, it gets warmer and warmer, and at last produces perspiration. Put on a hot one, and it gets colder and colder, until it gives you the rheumatism. Passion decreases after passing too often through the madness of jealousy. Liking and affection increase—increase constantly, even in spite of bad temper, which is the greatest enemy to happy association."

We should never leave off if we were to begin quoting from the two sparkling papers on the Pearls and Mock Pearls of History, and the Varieties of Literature and Art, each of which is placed at the beginning of a volume; but we cordially recommend them and all the rest of the book, except perhaps the paper on Junius, to the large and increasing class of readers who, like a celebrated Athenian epicure, prefer to have their food chewed for them.

G. A. SIMCOX.

#### NOTES ON LITERATURE.

Fraülein Ludmilla Assing, well known through her share in preparing the Varnhagen correspondence for publication, is at present engaged in editing the correspondence and literary remains of a more extraordinary if a less eminent personage, the Prince Pückler-Muskau, author of the once famous *Briefe eines Verstorbenen*, and the original of Immermann's satire. The mere biography of such a hero would scarcely call for notice, as the social celebrity which he laboriously achieved was only a caricature of that of Byron or Alfieri, with a double portion of extravagance to make amends for the lack of genius. But he was in correspondence with a good many of the celebrities of his time, and it was thought that his correspondence would contain some details of interest for the literary history of the century. This is true to a certain extent, though they are smothered in a mass of trivial *Liebes-Briefchen* of no intrinsic value, and of which the publication shows, to say the least, a curious conception of decorum. Apart from his eccentricities, the prince was chiefly famous for the marvels of landscape gardening executed under his superintendence at Muskau; on these he spent two fortunes, his own and his wife's, and as they were still incomplete, procured her consent to a divorce, that he might marry another heiress, for which purpose he came to England. The *Briefe eines Verstorbenen* were addressed to her to whom he had died in this singular manner, but the main purpose of his journey was not fulfilled. The most amusing part of the correspondence is that between Pückler-Muskau and Bettina von Arnim; but the extravagancies of the lady seem to have had a sobering effect upon her friend, who was not accustomed to being outdone in his own line. Bettina's accounts of her relations with Schleiermacher in some of the letters are *abenteuerlich* to a degree.

The February number of the *Atlantic* reproduces the almost forgotten story of Bettina's English translation of the *Briefwechsel mit einem Kinde*, how in disgust with the prosaic language of an Oxford and a Cambridge student whom she successively employed to translate her favourite rhapsodies, she resolved to learn English and to do the work herself, and actually did so, in language that was sometimes pathetic in its grammatical unreason. A colossal edition of 10,000 copies of this remarkable production was shipped without warning to this country, addressed to Messrs. Longmans & Co., who, sad to say,

declined to receive it, and not being ransomed, the consignment was finally sold for waste paper, as unclaimed stock. This and the following number of the same magazine also contain some interesting recollections by Mr. R. D. Owen of his father, Robert Owen, and New Lanark.

In *Unsere Zeit* (February 15) R. Gottschall discusses the "Modern Historical Drama," with a view to account for the fact that though 90 per cent. of the plays annually published in Germany are historical in subject only one per cent. of those acted are so. He points out that an historical play is not *ipso facto* emancipated from all concern for dramatic exigencies, and his remarks tend to limit the choice of the dramatist to historical incidents which have a natural dramatic unity and completeness, or to the illustration of a striking historical character by the help of more or less imaginary circumstances, which must not, however, be flagrantly at violence with truth.

M. Montégut in the *Revue* (March 1) gives from tradition a characteristic anecdote told of Bonaparte during his stay at Auxonne between 1788 and 91: there was a slight tumult, and the crowd had been vainly summoned to disperse; he ordered the troops to load, and then stepping forward said: "Citoyens, que les honnêtes gens se retirent bien vite; je n'ai ordre de tirer que sur la canaille;" of course the street cleared instantaneously.

We learn from the *Nation* that Mr. Brownson, the representative of independent Roman Catholic thought in America, has begun a new and "last series" of his *Quarterly Review*, which will treat of religion, politics, philosophy, and general literature.

Professor Bernhard ten Brink, whose Chaucer studies have met with due acknowledgment from English scholars, will soon remove from Marburg to his new position in the University of Strassburg. We hear the first volume of his *History of English Literature, coming down to Gascoyne*, is nearly ready for publication.

Dr. C. Th. Heigel writes to the *Allgemeine Zeitung* (March 9, 10) to combat the prevailing impression, explicitly countenanced by Baron Hormayr, that the extracts from the will of Ferdinand I., published by the court of Vienna in 1740 in answer to the challenge of the Elector of Bavaria, were falsified or forged. On the extinction of the Hapsburg male line Charles Albert claimed to succeed, under this will, to all the States governed by the late Emperor, though, like the Elector of Saxony, on his marriage with a daughter of Joseph I. he had renounced all claim to the inheritance in right of his wife, and had subsequently recognized the Pragmatic Sanction on his own account. Authorities then and later were divided on the question whether, according to German usage, the claim of the male representative of an elder female line was better than that of the *Erbtochter* of the last direct male heir. But an examination of the original documents in the Vienna Archives—so liberally opened to students under the direction of H. von Arneth—has convinced Dr. Heigel that Ferdinand's will did really speak of *eheliche Leibeserben*, lawful, not male heirs, as the partizans of the Bavarian claim insinuated.

<sup>1</sup> The *Allgemeine Zeitung* (Feb. 16) publishes some personal recollections of Friedrich Rückert, together with additional extracts from the correspondence between Rückert and Stockmar made use of in Baron Stockmar's memoirs. The latter belong for the most part to 1812-13, the period of Rückert's earliest loves and love-poems, and are characteristic of the intellectual tone of what was then Young Germany. As he approached middle age, Rückert's Oriental studies, like Uhland's mediæval and historical ones, had somewhat the effect of withdrawing him from the leading place he might have claimed amongst contemporary German poets; though the author of *Geharnischte Sonetten* could not well escape the tribute of a little patriotic doggerel in 1863. It appears from these reminiscences that the Persian mysticism naturalized in his verses was a fair representation of his attitude towards graver subjects of speculation, but we are assured that he died a Theist.

In the *Revue des deux Mondes* (Feb. 15), M. Maxime Du Camp reviews the condition of primary, secondary, and higher

education in Paris. In the elementary schools, which have a strong family likeness all the world over, he thinks the substance and methods of teaching all that can be wished, but buildings and playgrounds are urgently wanted. He repeats the complaints so often made of the effect of the *concours général* on the lycæums and private schools, and points to the obvious remedy of making the examination for the *baccalauriat-ès-lettres* a reality. The University education has been ruined, he considers, by politics, the Government not daring to appoint the best professors, because they were probably its enemies, while the actual professors found it easier to draw audiences by a display of liberalism than by serious zeal for tuition. M. Cherbuliez concludes the history of Méta Holdenis, a sentimental pietist adventuress from German Switzerland, with strange blue eyes, who ends as a Protestant deaconess. It is natural to compare her to Becky Sharp; without being as powerfully conceived, she is much more realistically painted, the subtlest point being that it is an indulgence to her to deceive herself by fancying that she is giving way to feelings which all the while are perfectly under control. Even when unmasked she still continues to think herself what it suits her best to seem; she has none of the cynicism of Becky, who never for a moment in her own inmost heart forgets that she is every bit as bad as it pleases the author to call her. Méta's intrigues are very ingeniously invented, but the writer scarcely allows himself time to work them out; as soon as she has begun to do serious mischief, she is baffled by a *coup de théâtre*, which would be more in place upon the stage.

A new tragedy, entitled "*King Vukashin*," has appeared from the pen of the fertile Serb dramatist, M. Ban.

The *Journal officiel de la République française* has recently published a report of M. Dozon, the French consul at Philipopoli, with regard to the genuineness of the popular songs collected among the Bulgarians of Thrace and Macedonia. M. Dozon has himself made a collection, embracing all the varieties of popular Bulgarian poetry, which is now ready for publication.

M. Zubek, the biographer of Komensky (Comenius), is about shortly to publish a complete edition of the works of the celebrated pedagogue. The first volume will contain his didactic works; the second, his philological works; the third, his philosophical and metaphysical.

## Art and Archaeology.

*Studies in the History of the Renaissance.* By Walter H. Pater. Macmillan and Co. 1873.

THERE are two kinds of criticism. The one, which may be called dogmatic, attempts to fix a standard of taste, propriety, and beauty, and judges by rule; the other, which may be called æsthetic, refers its judgments to the sensation of the individual critic, and sets up no other standard. If the former leads to a hard and Pharisaical lack of sympathy, the latter has a tendency to pass into mere intellectual Sybaritism. The æsthetic critic too easily becomes a voluptuary, seeking to stimulate his sensibilities by subtle flavours, instead of discriminating what is valuable from what is worthless for the information of the world. Yet his method is really right, for criticism is not a science, neither is there any absolute definition of beauty. The dogmatic critic is palpably absurd in trying to impose upon the world his peculiar canons of taste. The æsthetic critic, if he has been resolutely careful to train his *αἰσθησις* by the study of great works, and if he possesses the faculty of explaining and giving a reason for his conclusions, is far more helpful to the cause of general culture. To expect an *objektive Gültigkeit* in matters of criticism is clearly false. It is enough that the critic should be accomplished, sincere, gifted with delicate perceptions, and rational. Mr. Pater professedly belongs to the second class of critics; his book is a masterpiece of the choicest and most delicate æsthetic

criticism. "What is the peculiar sensation, what is the peculiar quality of pleasure, which his work has the property of exciting in us, and which we cannot get elsewhere?" This question, which Mr. Pater asks (p. 40) of Botticelli, strikes the keynote to his critical method. He further explains his purpose in the preface; and each of his eight studies is a wonderfully patient and powerful attempt to do that which is most difficult in criticism, to apprehend for his own mind, and to make manifest to the minds of others, the peculiar *virtue* which gives distinction to the work he has to treat of. In this way the critic becomes himself an artist, a creator. He undertakes at once a higher and more difficult task than the Aristarchus of the schools, who is contented with applying his shallow foot-rule of preconceived opinion. As might be expected, the qualities of Mr. Pater's own temperament strongly modify his perceptions. We find in him (to use his own phrase) "a lover of strange souls." Nor is he wholly free from the intellectual Sybaritism to which the critics of his school, who feed themselves on beautiful things—"en exquis amateurs, en humanistes accomplis"—are liable. Comparatively isolated, indifferent to common tastes and sympathies, careless of maintaining at any cost a vital connection with the universal instincts of humanity, they select what gives them the acutest pleasure, and explain the nature of that pleasure to their readers.

The great distinction of this book is that its author has been completely conscious of what he wished to achieve, and has succeeded in the elaboration of a style perfectly suited to his matter and the temper of his mind. He has studied his prose as carefully as poets study their verses, and has treated criticism as though it were the art of music. Yet he is no mere rhetorician. The penetrative force and subtlety of his intellect are everywhere apparent. There is scarcely a superfluous word or a hasty phrase in the whole volume. Each paragraph, each sentence is saturated with thought; not with that kind of thought which Novalis described as a "dead feeling, a wan, weak life," but with the very substance of the feeling which only becomes thought in order that it may receive expression in words. To do justice to such a style either by quotation or by description is difficult. Yet the following sentences may be extracted as containing in brief something of the peculiar flavour which gives value to the book:—"A certain strangeness, something of the blossoming of the aloe; is, indeed, an element in all true works of art; that they shall excite or surprise us is indispensable" (p. 62). "No one ever expressed more truly than Michel Angelo the notion of inspired sleep, of faces charged with dreams" (p. 59). "The spiritualist is satisfied in seeing the sensuous elements escape from his conceptions; his interest grows, as the dyed garment bleaches in the keener air" (p. 195). "I suppose nothing brings the real air of a Tuscan town so vividly to mind as those pieces of pale blue and white porcelain, by which he is best known, like fragments of the milky sky itself fallen into the cool streets and breaking into the darkened churches" (p. 53). So consummate is Mr. Pater's style that we are surprised to find that he should ever have allowed himself to repeat the same phrase (pp. 64, 66, "but only blank ranges of rock and dim vegetable forms as blank as they"). In like manner he is so patient and perfect in his study of picturesque details that we are almost in spite of ourselves forced to challenge the veracity of his images. For the most part, he will be found as accurate as he is subtle. Yet when he speaks (p. 30) of "that map or system of the world held as a great target or shield in the hands of the grey-headed father of all things, in one of the earlier frescoes of the Campo Santo at Pisa," he has forgotten that the point of this old picture lies in the fact that it is *not* the creative Demeurgus, but Christ, in the prime of manhood, who supports

the disc of the universe, with its concentric rings of created beings. Such minute criticism, however, is mere cavilling.

The unity of the book, which is made up for the most part of essays collected from periodicals and polished by their author, consists in this, that each article treats of some phase of the Renaissance through a representative character or work of art. Two are devoted to French literature, and Mr. Pater is particularly happy in his exposition of the theory that the renaissance of modern Europe originated in France. The truth of this theory, which may easily be exaggerated, is that the renaissance was not a sudden and violent explosion of the fifteenth century, but that in all the countries of Europe which possessed the elements of culture—in southern Spain, in Provence, in Frederick the Second's Sicily, in the Paris of Abélard, in the Florence of Boccaccio, and in the Lombardy of the Paterini heretics—the qualities of renaissance striving after liberty were discernible within the middle age itself. Of Mr. Pater's two French studies, that on Du Bellay, in whom he sees "the subtle and delicate sweetness which belong to a refined and comely decadence," is perhaps the more interesting. Like Théophile Gautier and like Baudelaire, Mr. Pater has a sympathetic feeling for the beauty of autumn and decay. He is not even insensible to "what may be called the fascination of corruption." This, which is a very genuine note of his æsthetic temperament, leads him at times, I think, to make mistakes of criticism. A notable instance of this is to be found in his interpretation of Botticelli's Madonnas. They are all painted after one fixed type of beauty—Botticelli, like all true artists, having selected and assimilated for himself from the multitudes of forms just that which represented his peculiar ideal. Mr. Pater imagines that in that sad, languid, sleepy, pallid woman, Botticelli sought to depict one who, "though she holds in her hands the 'Desire of all nations,' is one of those who are neither for God nor for his enemies" . . . one to whom the visit of Gabriel brought an "intolerable honour." I cannot do justice to the eloquence and grace with which this theory is worked out in the essay on Sandro Botticelli. But I must suggest that it ascribes to the painter a far greater amount of sceptical self-consciousness than he was at all likely to have possessed. However we may explain Botticelli's preference for that melancholy type of beauty, we must remember that Lippo Lippi, his master, and Filippino Lippi, his fellow-student, present us with two other varieties of the same type, markedly different, it is true, in sentiment from Botticelli's, but yet like enough to justify the belief that the type itself was the note of a specific school, and not the deliberate invention of an antagonist of the most cherished Catholic tradition. It is far more consistent with Florentine feeling to suppose that in his Madonna's melancholy Botticelli tried to delineate her premonition of the coming sword, and not her weariness in being the mother of the sinless Saviour. A criticism of Michel Angelo, which is marked by the same subtlety and originality, may be questioned in like manner as somewhat over-refined. In the essay on Luca Della Robbia, Mr. Pater defines with much delicacy what are the different methods by which great sculptors have spiritualized their several kinds of work. Passing to Michel Angelo, and noticing the incompleteness of much that he has left, he says: "Well! that incompleteness is Michel Angelo's equivalent for colour in sculpture; it is his way of etherealizing pure form, relieving its hard realism, communicating to it breath, pulsation, the effect of life." This is extremely ingenious, and subjectively it is, perhaps, true: *we* gain by the suggestive ruggedness of much of Michel Angelo's work—in which it seems as if a soul were escaping from the stone. But did Michel Angelo really calculate

this effect? That is what is more than doubtful. When he had the time, the will, the opportunity, he finished with the utmost polish. His "Moses" and his "Night"—the latter of which he illustrated by one of his most splendid poems—are smoothed and rounded and completed in their slightest curves. And to this perfection of finish his work was always approximating. That it often fell short may be explained simply by the facts of his life and the strange qualities of his temperament.

In the essay on "The Poetry of Michel Angelo" Mr. Pater shows the truest sympathy for what has generally been overlooked in this stern master—his sweetness. The analysis of the nature of that sweetness is one of the triumphs of Mr. Pater's criticism. Leonardo da Vinci attracts him less as an artist merely than as a personality of deep and splendid fascination. Pico della Mirandola again receives a separate study, in which we are made to feel with an intensity peculiar to Mr. Pater's style, the charm, as of some melody, which clung about him. The longest essay in the book is on Winckelmann, which, besides containing a very interesting sketch of the man, is full of good criticism of the Greek in contrast with the modern spirit. What is said on p. 195 about the way in which Winckelmann was privileged to approach Greek art is perfect. As the book begins with a preface which sets forth the author's theory of criticism, so it ends with a conclusion in which he expresses his theory of life. Between the cradle and the grave we have but a short breathing space. How are we to use it best by "getting as many pulsations as possible into the given time?" Mr. Pater's answer is that Art is after all the most satisfactory pursuit: "Of this wisdom, the poetic passion, the desire of beauty, the love of art for art's sake has most; for art comes to you professing frankly to give nothing but the highest quality to your moments as they pass, and simply for those moments' sake." J. A. SYMONDS.

#### ART NOTES.

The death of Gustave Ricard has excited universal regret in France. At Marseilles, where he was born, his portrait (one of his latest works), crowned in gold and veiled in crape, has been placed in the centre of the grande salle of the Cercle Artistique. M. Joseph Autran, of the Académie Française, has published a sonnet to the "Noble artiste aimé, dont nous creusons la tombe," and M. Charles Yriarte in the present number of the *Gazette des Beaux-Arts* contributes an appreciative biographical and critical article. Gustave Ricard was born in 1824, at Marseilles, and went to Paris in 1844 to study in the atelier of Léon Coynet, and from thence in 1847 to Italy, where he passed some time at Rome, Florence, and Venice. It was the great Venetian masters who chiefly attracted him, and their influence was to the last apparent in his painting. In 1850 he exhibited in the Salon a little painting of "Une Bohémienne tenant un chat," which at once brought him into notice, and from that time he contributed regularly to the great French exhibition, sometimes sending as many as eight or nine portraits, until 1859; when for some unknown reason he withdrew entirely from public exhibition. He lived, we are told, a simple retired life in the midst of Paris, and never sought to attract popularity; his work indeed was more calculated to please the critical few than the undiscerning many. His portrait, of which there is a fine etching by M. Le Rat in the *Gazette des Beaux-Arts*, is more like that of a Venetian senator by Titian or Moroni than a modern French artist by himself.

The *Gazette des Beaux-Arts*, the publication of which was delayed from the 1st to the 6th of March on account of the extra number of plates, contains—1. An article by M. René Menard on the important collection of paintings of the French school in the possession of M. Laurent Richard. Several engravings from the pictures in this collection are given; among others a strong and somewhat coarse etching by M. Feyen

Perrin of Delacroix's Médée, of which M. Laurent Richard possesses a reduced copy, and a charming etching by M. Greux after Dupré called La Rivière. We understand that this collection is to be sold at Paris early in April. 2. A notice by Emile Galichon of J.-C. Robinson's *Critical account of the drawing by Michel-Angelo and Raffaello in the University Galleries, Oxford*. 3. An account of the writing and ornamentation of the charters and diplomas in the Musée des Archives Nationales, illustrated with several quaint examples of grotesque Gothic ornament. 4. The biographical account of Gustave Ricard, before mentioned. 5. An article entitled "Un collectionneur de l'an VI.," which makes known a most important collection of pictures that has been hoarded away in the Rue Castiglione, by M. Papin, without any one suspecting its existence. The collection includes paintings of the Italian, the German, the Flemish, and the French schools, but the later Dutch masters are the best represented. The *Gazette* furnishes us with etchings from pictures by Isaac van Ostade, Philip Wouwerman, Phil. Debucourt, and Ruysdael in this hitherto unknown collection. 6. M. Alfred Darcel concludes his article on "Le Mouvement Archéologique relatif au moyen âge." 7. In an article entitled, though for what reason does not appear, "From Hugo van der Goes to John Constable," M. Henri Perrier deigns to acknowledge the existence of an English school of painting, and to regret that it is unrepresented in the Louvre. M. Perrier gives a slight and somewhat inaccurate account of several of our English landscapists, and then passes on to some of the least noteworthy of the later Dutch masters. The article is illustrated by a portrait of Canova by Jackson, an etching of a Fishmonger's stall, after Abram van Beyerens, and "Les bords de la Meuse," after Van Goyen. It will be seen that this number of the *Gazette des Beaux-Arts* was well worth waiting for.

An exhibition of the works of the late Léon Vaudoyer, one of the most distinguished architects of the present day, is open for a few weeks at the École des Beaux-Arts. His greatest work, the Cathedral of Marseilles, begun in 1855, was unfortunately left unfinished at his death, but it is hoped that the drawings and plans he has made for it will be sufficient to enable his friend and pupil M. Esperandieu to continue the work in the spirit in which it was begun by the master. Léon Vaudoyer was one of those architects who aspire to create a modern style.

A sale was announced for March 1 of the studies and sketches of Aug. Anastasi, the French artist who, it may be remembered, was struck with blindness in 1870. In the preface to the catalogue there is a short account of Anastasi's life, distinguished alike by its talents and its misfortune. The finished works of the artist's studio were sold about a year ago, and met with successful competition, but at that time, when he was still hoping to regain his sight, Anastasi could not make up his mind to part with his cherished studies and sketches for future paintings. Now, however, all hope is over, and the poor blind painter sells everything. The catalogue, besides a few paintings, contains a list of 400 studies painted from nature, and 200 water-colour drawings.

At a recent sale by Messrs. Sotheby, Wilkinson, and Hodge of ancient and modern engravings, the property of a well-known print-collector, the following high prices were realized:—By Albrecht Dürer, "Adam and Eve," £73; "St. Hubertus," £36; "Melencolia," £31 10s. By Marc Antonio, "Adam and Eve," £59; "Paul Preaching at Athens," £84; "St. Cecilia," £50; "Judgment of Paris," £80; "A Woman Watering a Plant," £94. By Raphael Morghen, "Aurora," £53; and lastly the celebrated print of the "Three Trees," by Rembrandt, £123. At the sale of the Hippisley collection, from whence this impression was derived, it fetched £83.

The annual exhibition of the Cercle de l'Union Artistique in the Place Vendôme is, we are told, crowded every day. This exhibition of the great art club of Paris forms, as it were, the *anti-chambre* to the "Salon," for many French artists allow their pictures to be criticised here before sending them to the greater exhibition of the Champs-Élysées, which does not open

until May. The great attraction of the present collection is a full-length life-size portrait of Madame Rattazzi, by Charles Jalabert, which stands forth from a brilliant scarlet background. It is said to be an excellent likeness as well as a most striking painting. Other works of great merit are—"Sur la Plage," a fine effect of sea and sky, by G. Jundt; "Le Rosario, Souvenir d'Espagne," by Gustave Doré; "Le Passage du Gué," by Broun; and "Laveuses à Medinet en Egypte," by Bonnat.

The March number of the *Portfolio* contains the beginning of a narrative called "The Sylvan Year," by Raoul Dubois. The author tells us in the preface that "whatever Nature may be from the strictly scientific point of view, it is interesting to the artist (whether literary or pictorial) mainly as it is related in ways more or less mysterious to the world of feeling which lies within our own breasts." He has therefore deemed it advisable to "introduce one or two fictitious personages and an element of human interest" into what promises to be a descriptive history of the forests on the banks of the Loire. "The Sylvan Year" is enriched by two splendid etchings, one, a flight of wild geese over a barren moor, by Karl Bodmer, and the other, some trunks of forest trees in weird sunlight, by P. G. Hamerton.

Among Professor Brunn's *Archæologische Miscellen* which appear in the Transactions of the Academy of Science at Munich for November last, we find notice of two monuments which have a special interest for students of ancient art in this country: (1) the so-called Harpy monument discovered by Sir Charles Fellows in 1838 on the acropolis of Xanthus, and now in the Lycian Room of the British Museum, and (2) an archaic figure of Apollo acquired for the national collection about ten years ago from Lord Strangford, and now in the Phigaleian Room. The peculiarly archaic style of its sculpture, in which the elements of an Attic and a provincial school seem to be blended, has obtained for the Harpy monument a place of considerable importance among the remains of ancient art, while the obscurity of the subject which it represents has given rise to a conflicting variety of opinions. As regards the peculiarities of style, Brunn had previously (1870, ii., p. 205) communicated his opinion. His purpose is now with the interpretation of the subject. Curtius, the most recent authority on the matter, had discovered in the egg-shaped bodies of the Harpies, from which the monument derives its name, a profound symbolical manifestation of belief in the immortality of the soul. What suggested this idea was the fact that the Harpies are undoubtedly represented as in the act of carrying off the souls of deceased persons, whether the daughters of Pandareos, as is supposed, or not. And what further lent colour to the theory was the presence of such attributes as the apple and pomegranate, which were associated in the Greek mind with thoughts of a life in the lower world. On the other hand, Brunn points out that the primary signification both of the pomegranate and apple was that of a symbol of marriage, and that it was only through their occurrence as symbols of the marriage of Hades and Persephone that they came to have some indirect reference to after life. Of the other attributes which occur on the monument, the cow with its sucking calf, the egg, and the dove of Aphrodite are obvious emblems of family life. The same must be said of the three stages of life represented by the figures of a boy, a youth, and a man. Starting, therefore, with the idea that the artist's design was simply to indicate the ties of family life which had been broken by the death of the person or persons whom he was employed to commemorate, the subject admits of easy explanation. It is unusual, no doubt, to find in the sepulchral art of Greece such an obvious representation of death as that of Harpies carrying off souls, the mere existence of a *stèle* or a tomb being sufficient evidence of that event. It should, however, be borne in mind that we have here to do with the work of a people not purely Greek, and distinguished above all, as far as we know, for the veneration of their dead. That people accustomed to the contemplation of death, as the Lycians appear to have been, may have regarded such representations of it without horror, is not unlikely. That they had arrived at a belief in the immortality of the soul at the early period to which this monument is assigned, is highly improbable.

With regard to the Strangford Apollo, Brunn has found from a detailed comparison of it with the Aeginetan statues in Munich

that it belongs to the same school, the differences being only such as would be expected among the individual artists attached to one school, and, indeed, not much greater than those which have been observed between the sculptures of the western and those of the eastern pediments of the temple at Aegina. The expression of face in the Strangford Apollo and the position of the eyes and mouth are more pleasant than in the Aeginetan figures, which never fails to produce a feeling of disappointment when we turn from the finely rendered anatomy of the body to the petrified smile of the face.

An exhibition of the works of the late Edward Magnus has recently been opened at Berlin. There is a notice of it in a recent number of *Im Neuen Reich*. The critic considers that Magnus's chief significance for the present generation lies in the peculiar conception of womanhood in his paintings.

Now that the Cesnola collection of antiquities from Cyprus has left this country for good, and the air has again become clear of the thunders of our watchful monitors in the press, it is consoling to find that the opportunity was not also lost of securing photographs of such of the objects as in our present state of knowledge might be deemed the most important for purposes of historical study. A series of photographs from objects selected for this purpose has been published under the title of *The Antiquities discovered in Cyprus by General di Cesnola, with an Introduction by Sidney Colvin, M.A.* (London: Mansell and Co. 1873.) In the introduction Mr. Colvin has succeeded admirably in placing in a vivid light the very scant knowledge which we as yet possess in reference to that very obscure problem, the relationship of early Greek sculpture to the contemporary art of Assyria and Egypt, a problem upon which the time appears not to have arrived yet for an influx of new light. At all events the hopes recently raised to a high pitch by discoveries in Cyprus seem to have little promise of being speedily realized. Further research may do a great deal, especially if attended with the discovery of sculptures in the more precious materials in which those artists loved to work, by whom the craft in Cyprus is assumed to have been influenced. Again, before we can be satisfied of a genuine Greek influence having been exercised on the art of that island, it will be necessary to produce, instead of a multitude of heads, at least a few bodies in which a sincere effort has been made to reproduce the human form with some degree of truth to nature. For Greek sculpture, it would seem, had not itself shaken off Asiatic influence, and certainly had not risen to the rank of a fine art, until it took to statuary and the close study of the human form. That which is most striking in the remains of Greek sculpture, the scarcity of heads as compared with torsos, is exactly inverted in the case of Cyprian remains. Meantime we must be thankful, even though these photographs are not the best that could be produced, for the service which has been rendered by preserving the typical objects of the Cesnola collection in a manner with which serious students of ancient art can have no reason to complain.

In a letter to the *Athenæum*, of March 8th, Mr. Wood communicates an account of his excavations at Ephesus, together with a ground plan of the Temple of Diana, the accuracy of which appears for the most part to be vouched for by remains found *in situ*. Short as it is, the letter conveys a striking picture of the difficulties and hardships which beset enterprise of this kind in a country where the population is enervated by marsh fever and degraded by superstition. The marvel is that even the ambition of finding one of the lost wonders of the ancient world should have sustained Mr. Wood through these years of incessant toil and vexation. As an architect he would also of course have derived a powerful impulse from the fact that the site of the Temple of Diana, if anywhere, was the spot on which some of the most important questions of Ionic architecture might be finally determined. The temple is now found to have been octastyle, that is, with a row of eight columns in front, not decastyle, as had sometimes been supposed, for the sake of working in Pliny's measurement of the width (220 feet) without requiring what was obviously much too large an intercolumniation. And yet Pliny's measurement seems to be correct, the fact being that it applies very well to the lowermost step of the raised platform on which the temple stood, and not to the uppermost step. This lowermost step measures 238 feet

3½ inches English. Mr. Wood is not yet prepared to verify the dimension of length given by Pliny. With regard to the number of external columns, Pliny is again found to have been accurate in reckoning them at one hundred. Of these thirty-six were sculptured (*columnae coelatae*). Having found important remains of sculptured columns in front, Mr. Wood proposes to account for the thirty-six by placing two rows of eight each at either end, though as yet no trace of sculptured drums has been found in the rear, and one at each of the four *antae*. It still remains a puzzle, however, whether we are to interpret Pliny's expression as meaning that the columns were sculptured all the way up, or whether only a portion at the base was decorated with figures in relief. From Mr. Wood's letter in the *Times* (25th February) they would appear to have been sculptured to the distance of at least three drums up from the base. Each drum being of the height of the figures upon it, that would give three tiers of figures. If this be so, it is singular that the bronze medallion in the Bibliothèque in Paris, which presents a view of the front of the temple, should only show one row of figures on the columns. As to Pliny's other statement that twenty-seven of the columns were the gift of kings, the only evidence as yet found consists of some fragments of base mouldings, on which large finely-cut letters occur, which are so far intelligible that they must be parts of proper names, and possibly the names of the donors. The excavations now employ a large force of workmen, and it is to be hoped that before the unhealthy season sets in the entire area of the temple will have been explored. When this is done it would be advisable to clear away the soil to some distance round the outside of the platform to see whether or not the sculptures of the upper part of the building, if there were any, may not have been thrown outwards by the fall.

During the summer of 1874 a very interesting exhibition will take place in Russia. The venerable city of Kief has been chosen as the seat of the next triennial meeting of the Russian Archæological Congress, and the President of the Moscow Archæological Society, Count Oubarof, has issued circulars calling the attention of antiquarians to the exhibition which will then and there be held. All kinds of objects in any way illustrative of Slavonic archæology will be gladly received for exhibition, and it is hoped that a most valuable and instructive collection will be brought together. The period which it is chiefly intended to illustrate is that which lies "between the seventh or ninth century and the end of the fourteenth," that is to say:—For Russia, up to the death of Dmitry Donskoi (1389); for Bohemia, Moravia, and Silesia, to the death of Wenceslas IV. (1419); for Servia, to the battle of Kasof (1389); for Poland, to the death of Louis of Hungary (1382); for Galicia, to the death of Casimir III. (1370); for Pomerania, to the death of Wratisslas VII. (1457); for Dalmatia, Bulgaria, Lusatia, Hungary, Croatia, Roumania, &c., to the end of the 14th century.

The "Wagner Society" repeated the scheme of their first concert at St. James's Hall, on March 6th, as announced. The hall was densely crowded, and the enthusiasm of the audience even greater than the first time, which shows how decided a mark the works of Wagner have made in this country, as they had to appeal this time not to a narrow circle of special friends, but to a miscellaneous gathering. The engagements of Herr Diener on the continent had made his stay for this concert impossible. In consequence his place as vocalist had been taken by Mdle. Girardi and Signor Garcia. The former sang "Elizabeth's Prayer" from Tannhäuser and "Elsa's Song" from Lohengrin with good taste and a fresh voice. Signor Garcia gave but little satisfaction in Wolfram's "Romance" from Tannhäuser, while two French songs written in Wagner's earlier style seemed to be more congenial to his powers of rendering. The orchestra followed their excellent leader Mr. Dannreuther with unabated enthusiasm and bravura.

Mr. Walter Bache's ninth annual concert took place on February 28th. The most interesting features were two new works by Franz Liszt, the introduction of whose compositions into this country is exclusively owing to the meritorious zeal of his distinguished pupil. They were Psalm xiii., and the "Chorus of Reapers" from Herder's "Prometheus." The former

work is an elaborate setting of the biblical text for tenor solo, chorus and orchestra, in which the style of contemplative repose which is generally thought to befit the musical rendering of religious subjects is changed for the most modern expression of personal feeling. Since Beethoven's "Missa solemnis," the former style would indeed seem, to say the least, antiquated, and we can only give our fullest consent to Liszt's attempt to individualize the character of the struggling and despairing psalmist in the most dramatic manner. The effect of the work depends in consequence to a great extent on the rendering of the solo part, and in the qualities required for this most difficult task Mr. Henry Guy was entirely deficient. His agreeable but not very strong tenor was almost crushed by the pressure of Liszt's passion combined with a full-scored orchestral accompaniment. Chorus and orchestra, conducted by Mr. Bache, were excellent both in the surmounting of difficulties of counterpoint and in the tenderness of the melodious passages. The "Chorus of Reapers" is a musical idyll, full of delicious melody and orchestral colouring, reminding one of Beethoven's "Pastoral symphony" with its songs of nightingale and quail. The public were charmed and surprised by this mild form of the "music of the future," and demanded the chorus *da capo*. Wagner's "Huldigungs Marsch," a piece full of broad melody and festive brilliancy, but of a strongly occasional type and only partly scored by the composer himself, was the third novelty of the evening. It remains to add a few words about Mr. Bache's playing of Schumann's concerto in A. (Op. 54). We have repeatedly pointed out the great technical skill, combined with a rare perception of poetical intentions, which advantageously characterize Mr. Bache's style. It required all these qualities to render successfully the plaintive passion of the first part, and to surmount the enormous difficulties of the brilliant finale in the way, which elicited the most enthusiastic applause of the audience. This piece, and the choral march from Beethoven's "Ruins of Athens," were conducted by Mr. Manns.

- (1) *Voyage en Abyssinie*. Exécuté de 1862 à 1864. Par Guillaume Lejean. Text and atlas folio. Paris: L. Hachette et Cie. 1872.
- (2) *Guillaume Lejean et ses Voyages*. Par Richard Cortambert. Extrait du Bulletin de la Société de Géographie. Paris: Ch. Delagrave et Cie. 1872.

FROM M. Cortambert's very pleasant sketch of the life of the well-known French traveller, whose posthumous work on Abyssinia is now before us, we learn that Guillaume Lejean was the son of a humble Breton farmer, of Plouégat-Guerrand, in Finistère. Distinguished as a youth by his intelligence, love of work, and retentive memory, he was taken in hand by the priests of the College of St. Pol de Léon, who hoped one day to see him take a high place in their brotherhood. But his independent spirit rebelled against the monotonous

calm of the ecclesiastical profession, and chose rather the uncertainties of a free life. Appointed secretary to the Sous-Préfecture of Morlaix at an early age, and availing himself of his position to gratify his love of historical research, he found in the archives of the town the materials for a "Communal History of Finisterre," which he published in his twenty-second year, and, later, for a work on "Brittany and its Historians." In 1847 he came to Paris, where he maintained himself for a time as a journalist. Ancient geography, closely allied as it is to history, became a favourite study: Lejean was specially attracted towards that of Turkey in Europe, which offered striking comparisons of a bygone age with a story in process of formation; a great past to examine, and a strangely curious present period of nationalities the most diverse and tendencies the most opposite submitting to the rule of a handful of Asiatic Mohammedans, who for centuries have been, as it were, camped in Europe. It was now his good fortune, favoured by recommendations from several distinguished men, to obtain a mission from the Institute to travel in the East, and soon Lejean was traversing on foot the mountains of Albania, Bulgaria, the Roumanian Principalities, Herzegovina, and Montenegro, noting alike the diversified topography and ethnology of those countries. This tour enabled him to prepare a monograph on the peoples of Turkey, accompanied by a map, which was published as one of the supplementary parts of *Petermann's Mittheilungen*, and is still perhaps the most important work on the ethnography of that part of Europe. A few years after his return to Paris from this undertaking he formed the project of ascending the Nile as far as its sources, and, favoured by the support of some one in high station, took his departure for Africa. To avoid a tedious passage up the Nile from Egypt he chose the route from Suakin on the Red Sea across the lower Akbara to Khartum, at the confluence of the Blue and White Niles. After some months spent at this point he ascended the White Nile, but was not successful in attaining any higher place than the neighbourhood of Gondokoro, where a succession of fevers and the hostility of the native tribes compelled a retreat, leaving it to Speke, Grant, and Baker to solve the enigma of the upper course of the mysterious river. Two years later, however, we find Lejean again in the basin of the Nile, this time charged with a diplomatic mission to King Theodore, who, believing himself to be the instrument in the hands of Providence by whom the diverse factions of Abyssinia should be forced into unity, had claimed the recognition of the sovereigns of Europe. The geography of this most interesting journey in the Abyssinian Highland, and the narrative of the stirring events through which it led until Lejean's fortunate escape from the hands of the tyrant, form the subject of his special work, which we shall notice further on. In 1864, having accepted a mission to Persia and Cashmere, he recrossed the scene of his former labours in Turkey, and journeyed thence on horseback through Asia Minor, visiting Mount Argæus and examining the ruins of Ctesiphon and Seleucia on his way to the Persian Gulf and India. Scarcely had he come back from this magnificent tour, when, still urged by the spirit of travel, he once more turned to his chosen field of labour in European Turkey, this time to begin an undertaking beyond his powers—the topographical survey of the whole country. Each year he departed for a surveying campaign of seven to eight months, returning to Paris only to arrange the notes which he had collected, and then to start afresh.

Worn out with incessant labour, and suffering much from the calamities which had overtaken France, whither he returned on the outbreak of the war, Lejean was carried off, in February, 1871, by fever, in the 47th year of his age, when residing at his birth-place in Brittany.

Lejean's narrative of his journey in Abyssinia was designed chiefly as a descriptive companion to the atlas of maps which show the topography of his lines of route, and in this respect it has a high geographical and ethnographic value. But it also possesses a more general interest as a graphic recital of the events in the career of the strange King Theodore, which formed a middle period between his first successes and his ultimate downfall and tragic end. The traveller made his way into Abyssinia from the western side, going in an almost direct line from Khartum, by Matamma and the northern side of Lake Tsana, to the hill camp of Debra Tabor in the centre of Abyssinia, then the headquarters of King Theodore. His first interview with the king took place at the neighbouring village of Gafat, which Theodore had given over to the Europeans then in his service, and whither he had gone to witness the testing of a mortar which had just been completed. At the audience granted next day at Debra Tabor, Theodore remarked with suspicion that the letters from the French Government were signed "Thouvenel," and not "Napoleon." But at first all went well, and Lejean was able by frequent excursions in the vicinity of the camp to map out accurately a large portion of the central province. War having been declared against the rebellious chief of the southern province of Godjam, Lejean, with other Europeans from Gafat, were required to follow the movements of Theodore's army in a raid, carrying fire and sword into the insurgent country as far as the centre of the peninsula of mountains round which the Abai flows after leaving the Lake Tsana. From this country Theodore's army, demoralized rather than beaten, was compelled to retreat. The campaign over, Lejean found orders awaiting him to repair to the port of Massowa, on the Red Sea, and he imprudently demanded an audience of the king. Exasperated by defeat, and learning that the Egyptians were about to invade his northern provinces, Theodore, in place of granting Lejean the desired leave to depart, ordered him to be imprisoned, and heavily chained. A new humour of Theodore released him from captivity, and gave him permission, as a prisoner on parole, to go whither he would in the central part of the kingdom. Taking advantage of this liberty, Lejean visited the eastern and southern shores of Lake Tsana, and journeyed thence northward to Gondar, the capital city, before returning to Gafat. Political events now led Theodore to move with his army to Gondar, and in the September of 1863 all the Europeans of Gafat had orders to repair thither. They found Gondar in a state of great agitation; the king inhabited its palace, and his army was encamped on the heights to westward; he was waiting for the English Consul, Cameron, and a messenger, whom he had sent to Paris to bring a reply from the French Government. At length this messenger arrived, and the letter was opened at an audience, all the Europeans being present; but the missive lacked the imperial seal, and Theodore, to defy the French Government, threw the letter at his feet, and pronounced sentence of Lejean's expulsion from Abyssinia. Never was a command more acceptable or more fortunate. Consul Cameron had laughingly said to Lejean on meeting, "Well, colleague, are the king's chains heavy?" little thinking that in a few weeks he himself was to prove their weight. The traveller's route to northward lay across the Lamalmon, a grassy and undulating slope on the southern side, but on the north an abrupt and terrible line of cliffs; then by Axum and Adowa to the coast. His escape was a narrow one, but it was not till later that Lejean knew that Theodore in a changed mood had sent men to follow and bring him back to Gondar, saying, "The man has escaped me, and I do not yet know whether he is a friend or an enemy."

Although Lejean's routes rarely if at any point touch upon new ground, since the whole country which he traversed had been described either by Bruce, Ruppell, D'Abbadie, Beke, or Heuglin in former years, they yet form a very valuable supplement to the work of these travellers, and must henceforward be considered an important geographical "material" for the delineation of the eastern side of the Abyssinian plateau. The maps of his atlas, drawn for the most part on the large scale of three miles to an inch, bear evidence of a minute record of every detail and accident of the ground. In laying down these routes, however, Lejean has depended entirely upon the astronomical positions determined by former travellers; if he had been able to make such observations independently from point to point, the value of his work would have been more than doubled. "Lejean saw rather the inspiration than the true science of topography."

A sketch of the history of Abyssinia before the sixteenth century is appended to the descriptive part of M. Lejean's work, and is an attempt to critically adjust the information given by native chronicles with the known history of the surrounding countries at that period. It traces the progress of the country from the earliest dawn of civilization down to the time when it was first visited by Europeans, and displays a great amount of careful research.

We are glad to observe in a note on the title page of the descriptive volume that M. Lejean's correspondence and manuscripts have been collected and arranged, and that the publication of his geographical and historical works is to be continued. His materials for the geography of European Turkey must be especially rich and valuable.

KEITH JOHNSTON.

### Notes on Scientific Work.

#### Geography.

**Western Mongolia.**—The route map, made during the Russian trade expedition of 1870 under Matusovski and Pavlinov in Western Mongolia, a copy of which is published in *Petermann's Mittheilungen*, gives a fresh proof of the incessant activity of Russia in extending its scientific knowledge of and commercial relations with the districts far south of its present Asiatic possessions. The track followed passes round the margin of the chief basin of continental drainage in Western Mongolia, which includes the lakes Ubsa and Kirgis-nor as its central points. From the outpost of Suok, near the boundary of the Siberian government of Tomsk, the travellers went nearly due east by Kobdo to Uliassutai; then turning to the north-west they crossed the range of the Tannu-ola, and reached the Russian territory again at Ussa, on a small tributary of the Yenisei in the government of Yeniseisk. The whole distance traversed is about 700 miles. We may expect to have important and fresh information on this region from the English traveller Mr. Ney Elias, who has just returned to England after a splendid tour across Mongolia from the Chinese side.

**South Africa.**—Letters received by Dr. Petermann from African merchants, and published in the *Mittheilungen*, communicate the important information that Portuguese traffic on the Zambezi has again sprung into activity, and encourage the hope of a speedy opening up of this almost unknown basin. Zumbo, a station on the north side of the Zambezi, about 450 miles in a direct line from the mouth of the river, was a complete ruin when Dr. Livingstone passed it in 1856. It was again occupied by the Portuguese in 1861, and has become the centre of a brisk traffic with the districts watered by the northern tributary rivers Aruangoa and Cafue. Other factories have since been founded higher up the river as far as the mouth of the Cafue. On the other hand the hold which the Portuguese retain of their possessions in Western Africa appears to have been much loosened of late years; their authority is said to have almost disappeared on the lower Congo, whilst southward the whole district of the Dembo tribes in central Angola is in open revolt against Portuguese rule. The only route that now appears to be open to an expedition going inland from that side is that which has already been twice traversed by Dr. Livingstone, as well as by other travellers, from Loanda eastward to Cassange on the Quango river, which is still under Portuguese dominion. It seems probable, under these circumstances, that the English expedition of the Lieutenants

Grandy, now perhaps on its way inland from Loanda, may have been compelled to take this course to gain the interior instead of that projected at leaving, which lay to north-east from the starting point on the coast towards the Congo.

**New Guinea.**—The advantages to be derived from an English occupation or colonization, from the side of Australia, of that unclaimed portion of the vast and rich island of New Guinea which lies east of the 141st meridian of longitude, the recognized Dutch boundary, seem again to demand notice. A pamphlet recently published at Rome by Signor Guido Cora,\* the editor of a new geographical publication named the *Cosmos*, has a special interest at this time. It describes the Italian voyage of exploration to New Guinea under Signor Odoardo Beccari, now in progress, and gives a sketch of our present knowledge of the geography of the chief island and its surrounding islets, with useful references to the works of the voyagers on whom we are dependent for information respecting it, from the time of its discovery by the Portuguese navigator Don José de Menezes in 1526. The scheme of exploring the eastern part of New Guinea for the purposes of colonization was first projected by the English in 1866. In 1867 an attempt was made at Sydney to organize a company to colonize the island, but the plan failed chiefly through the opposition raised by the Rev. Tennyson Wood in various articles published at that time in the *Australasian* journal of Melbourne. The subject was again taken up in 1869, when a proposal for a new exploration of New Guinea, on behalf of the German colonists in the Antipodes, was made by Dr. Petermann in his *Mittheilungen*. In the following year the Russian scientific voyage of Nicolaus Miclucho-Maclay was announced, and the exploration of New Guinea formed a chief part of its programme.† At this time also Sir Charles Nicholson, in a paper read before the Royal Geographical Society, and in 1871 by articles in the *Australasian*, drew public attention to New Guinea as a field for exploration and trade. Dutch jealousies having been awakened by these proposals, despatches were sent to the Governor-General of the colonies at Batavia, ordering him to send a vessel to take formal possession of the eastern coasts of the island. In consequence of this mandate the steamship "Dasson" was sent in 1871. The ship visited Maclure Bay, then Dorey on the west side of Geelvink Bay, and reached as far as Humboldt Bay, in 140° east longitude, on the north coast of New Guinea. The expedition was planned to visit the whole of the north coast, but a dangerous malady common on these coasts, and known as Beri-Beri, broke out among the crew, and compelled the commander to return without having accomplished his mission. Torres Strait, where it separates the northmost settlement of Queensland at Port Simpson from the south shore of New Guinea, is scarcely sixty miles in width, and is one of the chief gateways to the Pacific.

#### Zoology.

**Spontaneous division in Star-fishes.**—Mr. C. Lütken, of Copenhagen, so well known for his important researches on the Natural History of certain groups of the Echinoderms, has recently laid before the Royal Academy of Copenhagen the results of some very interesting and valuable investigations on the spontaneous division of the star-fishes and brittle-stars. Professor Verrill has recently described a new genus of brittle-star, *Ophiophela*, all the known species of which possess a number of arms greater or less than five, generally six, and in some few instances three or two; very rarely indeed does the normal number of five make its appearance. Lütken describes a new species of this genus, *O. isidicola*, on a certain number of specimens of which he finds six nearly equal arms, but in the majority of these specimens there is a marked difference between the three arms on one side of the body and the three arms on the other; in another set the difference is still more marked, the one set of three arms being quite small and the other of the ordinary size. In others, again, this difference is extended to the disk itself, and it looks as if it had been cut in two by a knife. In all these cases there can be little doubt that these appearances result from a primary division and then a regeneration of the parts that had been divided off. It becomes an interesting question how often such division could take place in any individual; without being able to pronounce any positive opinion on this point, Lütken inclines to the belief that up to a certain age it can be repeated several times. Allowing that the faculty of regeneration is very great among the ophiuroids (a disk of an ophiura deprived of all its arms will sometimes under favourable circumstances renew them all), still the phenomenon witnessed in *ophiophela* differs from a mere casual renewal of lost parts of an accidental lesion; there is a regularity and symmetry about it which certainly points to a true natural spontaneous division having for its object the multiplication of the individual. It must not be forgotten, moreover, that Profs. Steenstrup and Sars have observed the same phenomena in certain small ophiuroids with six arms, especially among

\* *Spedizione Italiana alla Nuova Guinea*; Cenni di Guido Cora. Roma: Civelli.

† An interesting extract from a letter written from the coast of New Guinea by M. Nazimoff, commander of the "Vitiáz," the chief vessel of the Russian expedition, is communicated to the *Bulletin de la Société de Géographie* for January, by M. Eliée Reclus.

species of the genus *Ophiactis* that live intertwined among corals and sponges, nor that the truth of their observations has been confirmed by Lütken himself. In one or two species of another genus, *Ophiocoma* (*O. pumila*), the same thing occurs; in these instances it becomes clearly apparent that in young individuals only this agamic form of reproduction takes place, and that with the adult forms the results of the division are truly sexual. Similar phenomena have been remarked in certain *Asterids*, notably in *Asterias problema* Stps., and in some allied species described by Verrill, as well as in *Linckia oryithopus* and *Ophidiaster cribrarius*. Lütken is of opinion that though there are many cases where the spontaneous division is merely gemmation more or less disguised, there are likewise many instances in which it is, so to speak, simple division and nothing else. In the case of the ophiuroids and asteroids he inclines to think it a normal form of multiplication, which takes the place of gemmation. It would have a near relationship to the power of regeneration on the one hand, and to that of gemmation on the other; and while it may not always be possible to clearly define the exact limits of these "powers," it is convenient to preserve to "Schizogony" an independent place among the different forms of agamic multiplication. The classifying of the phenomena above alluded to as occurring in the ophiuroids and asteroids in the category of "Schizogony," conclusively indicates, in short, that there is in this spontaneous division something altogether different from gemmation. The following general propositions are laid down by Lütken:—1. The most energetic manifestation of the faculty of regeneration in animals is the power of divisibility; 2. In certain forms of Radiates, in which the faculty of regeneration is very highly developed, spontaneous division takes place only, as in aphiuroids and asteroids, or together with gemmation as in Actinia; 3. Actual spontaneous division or Schizogony in the Actinia, Medusa asteroids and ophiuroids, which must not be confounded with the disguised form of gemmation met with in Infusoria and certain hetopods, may be regarded as a peculiar form of agamic reproduction, such as Blastogony, Sporogony, and Parthenogony.

**Researches on the Anatomy of the Limuli.**—M. A. Milne-Edwards, who has studied more particularly the circulatory and nervous systems of the king-crabs, holds the following views regarding the affinities of these animals:—The Limuli differ much less from the scorpions than from the crustaceans proper that form a portion of the recent fauna; and in a natural system they cannot be associated in the same class with the latter animals. Nor, on the other hand, can they be referred to the arachnids, from which they differ not only by their mode of respiration, but also by their compound eyes, absence of frontal appendages, continuous prolongation of the ventral appendicular series on the adjacent portion of the abdomen, and by several other peculiarities of organization. They differ also from all the other articulate animals in the arrangement of the circulatory system; and consequently, in spite of the small number of species in this group, they must be regarded as a distinct class intermediate between Crustacea and Arachnida. In former geological epochs the type from which the king-crabs are derived was represented by animals the general form of which approached still more that of the scorpions, for instance, by the gigantic *Pterygotus* and *Eurypterus*; and it has been well demonstrated by Mr. H. Woodward that all these animals form a natural group for which the name of *Merostomata* may be retained; but, in the author's opinion, they should not be confounded with the crustaceans, as is commonly done. The *Merostomata* were contemporaneous with the trilobites; and it would appear that there exist not only points of very great resemblance between these two groups, but also intermediate forms, by which a passage from one to the other is established. Therefore, some authors have thought proper to unite them under a common name; but this appears to M. Milne-Edwards to be at least premature, as it is impossible to pronounce legitimately a view on this point before we have a fuller knowledge of the appendicular system of the trilobites; and the author considers it to be very probable that the trilobites differ from the crustaceans proper as much as the *Merostomata* do, and that they should likewise form a distinct class. (*Annales des Sciences Naturelles*. Ser. 5, Art. 4, pp. 67, with 16 plates.) (We refer our readers for articles on the same subject to Vol. iii. of the *Academy*, viz., to one by Van Beneden, p. 30, and to another by Prof. Owen, p. 73.)

**Harvesting Ants and Trap-door Spiders.**—Notes and Observations on their habits and dwellings. By J. Traherne Moggridge. 1873. This is one of those few admirable little books the contents of which are as attractive to the general reader as interesting to the zoologist, on account of the originality of investigation. As indicated by the title, the book is divided into two parts. In the first part the author, whose observations were made at Mentone, shows that the accounts of the ancients, discredited by modern naturalists, of ants collecting and storing grain and other seeds for food, are strictly true with regard to certain species of southern Europe. It is singular that one of these species is an ant very common in central Europe (*Atta structor*), the habits of which have been studied by numerous observers, but which has never been seen to gather seeds of plants. None of the seeds found in their granaries germinate whilst they remain there, but they produce

vigorous plants when removed and sown in a proper locality. In the second part Mr. Moggridge describes the trap-door spiders and their various kinds of nests as observed by him at Mentone. Besides the ordinary kind, the author has discovered another with two doors, one of which is lower down the tube, and a third in which the spider constructs a branch tube opening at an acute angle into the main tube, and likewise closed by a hinged door. The illustrations with which the book is embellished are from the author's own hands, and are executed with great skill and neatness. We understand that Mr. Moggridge has deposited specimens of the animals and their nests in the British Museum and that they are exhibited in one of the public galleries.

The University Press of Cambridge, Mass., has just issued the *Illustrated Catalogue of the Museum of Comparative Zoology at Harvard College*. No. VII. *Revision of the Echini*. By Alexander Agassiz. Parts I. and II. The author of this work has evidently made himself thoroughly acquainted with the collections of Klein, Lamarck, Gray, and others. The preliminary part on nomenclature is especially valuable, but some readers will desire that in the preparation of this catalogue less attention had been devoted to nomenclature, and more to the description of the actual characters of specimens. It is illustrated by a number of maps, showing the areas of species, and forty-nine excellent plates, some lithographic drawings, and some autotype representations of American specimens.

It is with extreme regret that we have to announce the death of Mr. Julius Brenchley, of Maidstone, at the comparatively early age of fifty-six years. His love for adventure, and a deep interest for ethnographical and natural history pursuits induced him to commence in the year 1849 a series of travels, which may be said to have only terminated in 1867. He went first to North America, which he traversed in every direction, then to the Sandwich Islands, revisited North America, whence he turned southwards to follow the tract of the Andes as far as Chili. After a short excursion to Algeria and Morocco, Mr. Brenchley started for a second long journey to the East, crossing India to the borders of Thibet, visiting China, Japan, Australia, and New Zealand. In 1865 he accompanied Commodore Sir W. Wiseman in H.M. ship "Curaçoa" in a cruise through the waters of the South Pacific; and it is an account of this part of his travels, and a description of the collections made by him on that occasion, which he intended to give to the public in a work that has been the employment and recreation of the last few years of his life, and which, at the time of his death, was ready for publication. From this last journey he returned home through China, Mongolia, and Siberia. The vast collections illustrating natural history and ethnography which he formed have been deposited by him in the British and Maidstone Museums. The latter institution was an object of his constant solicitude, and the munificence with which he embellished and enriched it for the benefit of his native town has not been surpassed in the annals of any provincial museum.

### Chemistry.

**New Vesuvian Minerals.**—Scacchi has published a preliminary notice (*Rendiconto Accad. Sci. fis. e mat. di Napoli*, Fasc. 10, 1872) on some new minerals occurring in the lava and bombs of the eruption in April last year. Red deliquescent orthorhombic crystals were very often met with, of erythrosiderite,  $4 \text{ KCl}, \text{Fe}_2 \text{Cl}_2, 2 \text{H}_2\text{O}$ . A red sublimation, associated with sal-ammoniac, on the lava of S. Sebastiano proved to be kremersite,  $2 \text{H}_4 \text{N}, \text{Cl}, 2 \text{KCl}, \text{Fe}_2 \text{Cl}_2, 3 \text{H}_2\text{O}$ . Chlorocalcite was found on a large bomb which had been carried by the lava current as far as Massa di Somma; it consists of very deliquescent somewhat transparent and often violet-tinged crystals exhibiting the faces of the cube, octahedron and rhombic dodecahedron. They contain 58.76 per cent. of calcium chloride, the remainder being made up of the chlorides of potassium, sodium and manganese. Calcium chloride and manganese chloride therefore are isomorphous with the chlorides of the alkaline metals. Hydrofluoric acid has again been detected among the emanations of the volcano, and the slag of the fumaroles when placed over potassium carbonate under glass covers corrodes the glass and converts the carbonate into a mixture of chloride and fluoride. Cupromagnetite,  $(\text{Cu Mg}) \text{SO}_4, 7 \text{H}_2\text{O}$ , occurs in thin bluish-green crusts. When recrystallized from water it yields monoclinic crystals isomorphous with ferrous sulphate and containing seven equivalents of water. The crystals of sal-ammoniac of this eruption, besides exhibiting faces of the cube, octahedron, rhombic dodecahedron and leucitohedron, has been met with in the form having forty-eight faces (321). The yellow colour of some of the crystals is attributed to the presence of a basic chloride of iron.—Scacchi found lava in the shape of green transparent plant threads, in which little rounded masses were entangled, and resembling in every respect the Pélé's Hair of Mauna Loa. Rammelsberg has analyzed (*Ber. Deut. Geol. Gesell. Berlin*, xxiv., 3 Heft) the ashes which fell at La Cercola, and finds they have the same composition as the lava. He directs attention, "als Curiosum," to a paper read before the Chemical Section of the British Association at Brighton last year by G. Gladstone, in which it is asserted that this dust consists of magnetite and quartz, and that by treatment with acid a residue of pure quartz is obtained.

Rammelsberg has found that nearly forty per cent. of the ash enters into the composition of neither of these minerals, and that forty-five per cent. of the insoluble portion is not silica but oxides of metals.

**The Refractive Powers and Boiling Points of the Sulphur Derivatives of Carbonic Ether.**—E. Wiedemann (*Four. prakt. Chem.*, 1872, No. 19 and 20, 453) has determined the refractive indices of the following derivatives of carbonic ether, (C H<sub>2</sub>)<sub>2</sub> CO<sub>2</sub>, formed by the replacement of one, two or three atoms of the oxygen of that substance by sulphur :

- I. C O { S C<sub>2</sub> H<sub>5</sub>  
O C<sub>2</sub> H<sub>5</sub>  
II. C O { S C<sub>2</sub> H<sub>5</sub>  
S C<sub>2</sub> H<sub>5</sub>  
III. C S { O C<sub>2</sub> H<sub>5</sub>  
O C<sub>2</sub> H<sub>5</sub>  
IV. C S { S C<sub>2</sub> H<sub>5</sub>  
O C<sub>2</sub> H<sub>5</sub>  
V. C S { S C<sub>2</sub> H<sub>5</sub>  
S C<sub>2</sub> H<sub>5</sub>

Of these I. and III., as well also as II. and IV., are isomeric. In each instance the index of refraction increases with the introduction of sulphur in the place of oxygen, the increment being the greater the larger the amount of sulphur already present in the compound. *Ceteris paribus* the index of compounds containing CS as radicle exceeds that of analogous compounds in which the radicle CO occurs. Again, the index increases by the replacement of first one and then two atoms of the remaining oxygen of the compound, and the effect in the latter case exceeds that due to the introduction of sulphur in place of oxygen in the radicle. The isomeric compounds I. and III., and likewise II. and IV., have quite different indices, and in each case that compound has the greater index the sulphur of which is present in the radicle. The position then of the sulphur atom materially affects the magnitude of the refractive index. The boiling points of these compounds have been determined by F. Salomon (*Ibid.*, 433), and he has found that, the radicle being the same, the introduction of an atom of sulphur in every instance raises the boiling point of the ether 40°C. The exceptional increase in the case of carbonyldioxydiethyl and carbonyloxysulphodiethyl of 31° may be ascribed to a condensation attending the introduction of sulphur. A rise of boiling point of 4—5° attends the introduction of sulphur into the radicle.

**The Reactions of the Alkaloids with Sugar and Sulphuric Acid.**—It is proposed by R. Schneider (*Four. prakt. Chem.*, No. 19 and 20, 455) to make use of the bright colours developed by the contact of certain alkaloids with sugar and concentrated sulphuric acid as a means for determining their presence. Morphia under these conditions strikes a fine purple, 0.00001 gramme of this alkaloid distinctly exhibiting this reaction. After the lapse of ten minutes the colour turns to a bluish violet. Codeine undergoes the same change, which however is best shown with less concentrated acid. Narcotine and narceine give no characteristic reaction; and the same is true of the cinchona bases. Aconitine develops a fine rose colour which rapidly becomes of a dirty violet. Delphinine, chelerythrine and chelidonine also show characteristic colour reactions.

**An Isomer of Hydrocyanic Acid.**—With the object of testing the action of anhydrous hydrocyanic acid on epichlorhydrin O. Lange (*Ber. Deut. Chem. Gesell. Berlin*, 1873, No. 3, 99) enclosed these substances in a glass tube and exposed them to sunlight. At the end of three months the mixture had become solid and black. The carbonaceous mass after extraction with water yielded by treatment with ether a new substance, which when purified formed crystals of a reddish-brown colour by reflected light, a garnet red by transmitted light; some of them were 2 mm. in length. Analysis showed it to have a composition expressed by the formula C<sub>2</sub>NH. The solution of this body has a neutral reaction and undergoes decomposition when heated, with a separation of a humus-like flocculent substance. The crystals on being heated decrepitate and emit the odour of hydrocyanic acid. An aqueous solution when treated with baryta gives off ammonia and deposits a considerable amount of carbonate of baryta, the liquid containing a body possessing a sweet taste and all the properties of glycocholl. Analysis appears to confirm this. The author explains the reaction in the following way: C<sub>2</sub>H<sub>2</sub>N<sub>2</sub> + Ba H<sub>2</sub>O<sub>2</sub> + 3 H<sub>2</sub>O = C<sub>2</sub>H<sub>2</sub>N<sub>2</sub>O<sub>2</sub> + Ba C O<sub>2</sub> + 2 N H<sub>3</sub>.

**Synthesis of Phenanthrene.**—C. Graebe having recently observed that carbazol is formed when diphenylamine is passed through red hot tubes, it appeared probable to him that stilbene, if submitted to similar treatment, might yield phenanthrene. This he has now found to be the case. (*Ber. Deut. Chem. Gesell. Berlin*, 1873, No. 3, 125.) Stilbene was passed through a strongly heated tube filled with fragments of glass, and the products were collected. No hydrogen is given off, but a considerable amount of toluol is formed. On distilling the mixed condensed substances the latter passed over at 110—120° and the temperature then rapidly rose to 310—340°. To identify this body with phenanthrene some of it was oxidized, and the oxanthracene formed gave on analysis numbers that accorded with the formula C<sub>14</sub>H<sub>8</sub>O<sub>2</sub>. The author explains the decomposition of stilbene in the following way :

Moreover dibenzyl furnishes under similar circumstances phenanthrene in addition to stilbene and toluol.

**Anhydrous Liquefied Ammonia.**—A great number of experiments have been made by G. Gore (*Proc. Royal Soc.*, No. 141, 140) to test the behaviour of this liquid towards other substances, 250 different solids and liquids, simple and compound, having been placed in contact with it. In by far the greater number of cases no action takes place. Iodine liquefies and then forms a clear and slightly yellow solution. Liquid C Cl<sub>4</sub> mixes perfectly with the ammonia and is left behind after evaporation. Sulphur dissolves sparingly, liquid chloride of sulphur becomes dark red and solid in the gas and purple in the liquid. Bisulphide of carbon turns yellow and opaque in the gas, and in the liquid ammonia it is changed into a bulky yellow solid. The terchlorides of phosphorus and arsenic are each converted into white solids with manifest chemical action. Oxide of silver swells visibly, but does not dissolve; nitrate of silver is freely taken up and is deposited on evaporation in long crystalline needles. Iodide of silver dissolves rapidly and freely; the chloride and phosphate are insoluble and undergo no chemical change. The chlorides of mercury dissolves readily and the sulphate of this metal imparts a violet colour to the liquid. Thallium undergoes no change, but lithium, potassium, sodium or rubidium induces strong action and forms a deep indigo-blue coloured liquid; the presence of one of the chlorides of carbon prevents the development of this colour. Chloride of ammonium dissolves very freely and does not crystallize till nearly all the liquid has evaporated.

**Synthesis of Naphthalene.**—This has been accomplished by B. Aronheim by passing bromide of phenyl-butylene in the form of vapour through a tube, filled with caustic lime and raised to a low red heat. Scarcely any charring takes place, and the oily product which crystallizes on cooling is easily identified by its properties with naphthalene. The decomposition is thus effected :

The gas which escapes was found to be hydrogen. As the bromide has been formed synthetically the synthesis of naphthalene has thus been accomplished.

By reducing erythrite with formic acid A. Henniger has obtained (*Revue scientifique*, 15th February, 1873, 785), in addition to the glycol C<sub>2</sub>H<sub>4</sub>O<sub>2</sub>, that has already been described, a hydrocarbon which is absorbed by bromine and produces a solid bromide. This body is tetrabromide of crotonylene, C<sub>4</sub>H<sub>2</sub>Br<sub>4</sub>. It fuses at 116 and sublimes without decomposition. Heated with water it saponifies, forming a compound soluble in that liquid.

Writing last month from Florence, H. Schiff describes (*Ber. Deut. Gesell. Berlin*, 1873, No. 3, 143) a peculiar condensation product of glyoxal. It is formed by adding some hydrochloric acid to a solution of glyoxal in acetic acid and exposing the mixture to a gentle heat for some days. It forms a brilliant white powder, bearing a great resemblance to starch granules, and having the composition indicated below :

It is almost insoluble in ordinary solvents, and is distinguished by its great stability. The new compound he believes contains only a hydroxyl and no aldehyde group.

At recent meetings of the Royal Society, papers bearing the following titles have been communicated to the Society: "The Synthesis of Aromatic Monamines by Intramolecular Atomic Interchange," by A. W. Hofmann; "A New Method for producing Amides and Nitriles," by E. A. Letts; and "Colouring Matters derived from Aromatic Azodiamines (part ii., Safranine)," by A. W. Hofmann and A. Geyger. These contributions to the *Proceedings of the Royal Society* were already some months previously communicated to another society, the German Chemical Society of Berlin. The first two, reproduced in the *Chemical News*, January 3rd, appears in the *Ber. Deut. Chem. Gesell. Berlin*, 13th August, 1872, 704 and 669, and the last, reprinted in the *Chemical News*, December 27th, is in the *Berichte*, 24th June, 1872, 526.

## History.

*Études sur l'antiquité historique, d'après les sources Égyptiennes  
 et les monuments réputés préhistoriques.* Par F. Chabas. Paris:  
 Maisonneuve et Cie. 1872.

THE object of M. Chabas' work is to protest against the conclusions at which some of the disciples of Præhistoric Archæology have arrived, and to bring the light of Egyptian history to bear upon epochs hitherto reputed to be præhistoric. M. Chabas, long well known as one of the foremost and most trustworthy explorers of Egyptian antiquity, had his attention drawn to præhistoric speculation in the year 1865 by the accidental discovery of two flint knives embedded in the bank of the river Saone, at a spot situated some distance above the town of Chalon. Continuing his researches he subsequently found immense numbers of objects of antiquity of various kinds, and was able to form his own conclusions as to the manner in which they had been deposited. Other explorers were meanwhile engaged in the same pursuit, and it is perhaps not to be wondered that different opinions have been arrived at as to the epochs at which the various beds which have revealed themselves have been formed. M. Chabas inclines to a much more modern origin for the Saone formations than some other explorers attribute to them, and he shows good reason for doubting the distinctions of ages which have been made. His reasonings apply, however, only to conclusions drawn from the nature of the objects found, and he guards himself from being supposed to contest those drawn from purely geological considerations.

The term præhistoric is one open to much misconception. What is anterior to historic records in one country may be synchronous with a historical epoch in another, and in fact some parts of the globe are even to the present day in their præhistoric period. In Europe all beyond seven or eight hundred years B.C. lies in præhistoric darkness, while in

Egypt the clear light of history stretches back to 3,000 if not 4,000 years B.C. Whatever view we may ultimately arrive at as to the absolute antiquity of man upon our earth, it cannot be otherwise than useful in our inquiries to have a clear perception of the distance to which history in one part at least of the world really goes back, and of the state of civilization which it presents in its earliest strata. Up to the present moment the vision of nearly the entire educated world is limited by a chronology founded upon Greek and Hebrew records. Bunsen's well-founded idea of taking Egypt as the standard of all historical chronology has hardly emerged beyond the small circle of professed Egyptologists. It is true that exactitude cannot be pretended to in calculating the duration of the Egyptian dynasties; but the relative places of all are well determined, and there are records, for the most part contemporary monuments, amply sufficient to fill out 4,000 years. What is most remarkable is that at a very early point, nearly the extreme point at which monuments commence, the culture of the Egyptians is found already at the highest pitch of perfection, and the later ages gradually retrograde from the standard thus early attained. A clear recognition of this fact is certainly indispensable to any sound discussion of the archæological phenomena of Europe and the shores of the Mediterranean. It must at least be a problem worth considering, whether the stone and bronze epochs, which in Europe lie beyond the range of history, were anterior to or coeval with that resplendent period of Egyptian civilization which lies 3,000 years before the Christian era, or with some part of the long period of growing civilization which preceded it, or whether they may not extend very much later down towards the time when Greece first gained historic consciousness.

It is to lay a foundation for considerations such as these that M. Chabas has put together a series of disquisitions upon a variety of points connected with Egyptian civilization, and which may be taken as embodying the conclusions at which the soundest Egyptological inquirers have up to the present moment arrived upon the several points discussed.

In his first chapter M. Chabas shortly summarizes the various chronological schemes of Egyptian history which have been put forward, and judiciously rejecting all pretensions to minute accuracy, where the materials for accurate calculation do not exist, accepts as most probable the view that the reign of Menes, the limit of historical time, may be placed 4,000 B.C., with a præhistoric background of three or four thousand years for the unrecorded growth which brought Egypt to the point of civilization at which we then find her. The second chapter discusses the metals known to the Egyptians, in relation to which we will only note that M. Chabas maintains that iron and even steel must have been in use in the earliest times, although it must be admitted that the specimens preserved are few and the evidence of their antiquity defective. The Egyptian names of the various metals have been recently much discussed by both Lepsius and Dümichen, and some questions must still be considered as *sub judice*.

A chapter follows on the implements and arms of the ancient Egyptians, with which they are found as completely furnished at the earliest as at the latest periods of which we have record.

The longest and most interesting chapter in the book is that upon the nations known to the ancient Egyptians. In the very earliest times there is but little evidence of intercourse between Egyptian and surrounding nations. Yet the northern people, the dwellers on the shores of the Mediterranean, are mentioned as early as the fourth dynasty. In later times the races of the world were divided roughly into four—the Egyptians, Negroes, Asiatics, and North

Africans (the last probably including the peoples of Europe). Recent discoveries have shown that in the nineteenth dynasty (fourteenth century B.C.) the Sardinians, Sicilians, Etruscans, Lycians, and Achæans joined with the Lybians in an invasion of Egypt, and to these M. Chabas now adds Daunians, Oscans, Teucrians, and Pelasgi.

The people called in Egyptian spelling Tzakkriu were supposed by the late Dr. Hincks to be the tribe of Issachar. Others have quartered them elsewhere, but the identification with the Teucrians seems well-grounded. The Dardans were already known as figuring in the campaign of Rameses II. The people called Purista or Pulista have been hitherto taken for Philistines, but there is little more to support the view than the resemblance of names. The Pulista as drawn on the monuments are not of Asiatic type, and they are expressly said in one record to have come with the Tuirsha (Etruscans) from the midst of the sea. We have little doubt that in Pulista we have a form of the name Πελασγοί, and thus this mysterious people is brought into the full light of history, with its arms, costume, and accoutrements. The picture of a naval conflict between the Egyptians and the Pelasgi Teucrians and their allies, one or two hundred years before the presumed date of the Trojan war, although not a very choice specimen of Egyptian art, is worthy in many respects of the attention of Homeric commentators. Another picture of a skirmish between the Sardinian mercenaries of Egypt with the Pelasgian and Teucrian invaders, shows us that these people brought with them their wives and children, and we have representations of the carts drawn by oxen in which they carried them. This would seem to indicate that some of the invaders contemplated permanent settlement in Egypt.

In a chapter devoted to the stone arms and implements used by the Egyptians, M. Chabas shows that flint knives, saws, and cutting instruments were not only in use in the earliest periods of Pharaonic history, but that they continued to be employed under the Greeks, Romans, and Arabs; nay, that their use is not wholly extinct at the present day. Tools of flint appear to have been used almost exclusively in the working of the copper or turquoise mines of Sinai, under the early Pharaohs. In Egypt itself immense numbers of flint implements of every kind have been found in the neighbourhood of cities and cemeteries, and it is remarkable that the most finished of these instruments are those to which the highest antiquity is attributable, while those which belong to the Ptolemaic and Roman epochs are of a ruder character. The conclusions which had been hastily drawn as to the extreme antiquity of the immense repositories of flint tools which have been found in the neighbourhood of Thebes, fall to the ground. A great many of the specimens which have been picked up appear to be nothing more than fragments split by natural causes; but a certain number show indubitable marks of human skill. How far back the inhabitants of Egypt may have availed themselves of the rude tools with which Nature furnished them, it is impossible to say; but it is capable of demonstration that they continued to use them in a rough state until the latest times. Thus the prehistoric stations which it was thought had been detected on the barren deserts which lie close to Thebes, Memphis, and the other great cities of the Nile valley, were the repositories of cheap tools for the poorer inhabitants during thousands of years of historic time, and it is impossible to draw from them any conclusions as to the condition of the first settlers in the country.

In the sixth and seventh chapters of his work M. Chabas has brought together much interesting matter as to the horse and the camel, and the knowledge which the Egyptians had

of these animals. Neither of these creatures were indigenous, and they are not mentioned in the earliest monuments.

The last chapter is devoted to a consideration of the localities which have been considered præhistoric, and to M. Chabas' own discoveries in the valley of the Saone. He arrives at the conclusion that science has not hitherto demonstrated a very high antiquity for man antecedent to the historic period. Admitting the force of much of the argument of the learned Egyptologist, we must express our own belief that the antiquity of man rests upon quite other considerations than any that can be drawn from the works which he has left behind him, and that the question is one which lies principally in the sphere of geology. Nor does M. Chabas in fact contest this. But he argues that although man may be proved to have been the contemporary of the reindeer and the mammoth, there is nothing to show that the man of those periods stood at a lower point physically and intellectually than races which have existed in historic periods or even which exist at this day. However this question may ultimately be decided, M. Chabas' work is unquestionably an important and timely contribution towards the consideration of the problems which the recent growth of præhistoric inquiry has raised. C. W. GOODWIN.

### Notes and Intelligence.

**The Records of the Notaries of the Capitol at Rome.**—F. Gregorovius, the historian of the city of Rome in mediæval and modern times, has opened recently some new and highly important sources in intimate connection with his subject. In a paper read before the Historical Section of the Royal Society of Munich (see *Sitzungsberichte der philosophisch-philologischen und historischen Classe der K. B. Academie der Wissenschaften*. 1874. Heft. iv.) he gives a lucid account of the records of the notaries of the capitol at Rome, and especially of the minute-book of the notary Camillo de Beneimbene, from 1467 till 1505. It appears that, whereas formerly the urban notaries were accustomed to preserve their papers in their private chambers, a central record-office was erected on the capitol during the pontificate of Pius IV. (1559-1565). Afterwards by the bull of the 1st June, 1587, Pope Sixtus V. gathered these very ancient public servants into a college, or corporation, with certain office-bearers, and limited it to the number of thirty real members, in which shape it is still flourishing.

Among the volumes of their record-room, representing many centuries, hardly any other excites so much curiosity as the register once kept in a stout quarto volume of 1063 leaves by Camillo de Beneimbene, the fashionable and long-lived notary during the reigns of Paul II., Sixtus IV., Innocent VIII., Alexander VI., Pius III., and during the two first years of Julius II. The book, indeed, abounds in references to the period of the renaissance in general as well as to the private history of its most celebrated contemporaries. A man like Camillo was initiated in all the family transactions of the houses of Rovere, Cibo, Borgia, Medici, Alviano, Orsini, Colonna, and many more. All the successive matrimonial contracts of Donna Lucrezia Borgia, for instance, were drafted and executed by him. In this volume of minutes the whole history of Rome during a most stirring period of transition passes as it were before our eyes. No wonder, therefore, that a scholar like Gregorovius has not only largely excerpted from such treasures, but has selected for publication certain very curious extracts referring generally to the history of Cardinal Roderigo Borgia, afterwards Pope Alexander, his children, their friends and rivals. It is hardly necessary to mention how much light is thrown by these instruments of matrimony, divorce, and inheritance upon the moral history of Italy in the days of her literary and artistic glory.

Now and then, however, there occurs a document of value for foreign history. In 1740, by order of Pope Benedict XIV., the French Government obtained from this volume the original of a solemn act, dated the 6th September, 1494, by which Andreas Paleologus, despot of Romania, ceded to King Charles VIII. of France all his rights to the crown of the Byzantine Empire, an authenticated copy being now inserted in the vacant place.

In the month of March, 1504, Cardinal Adriano Castellesi bequeathed his palace in the Vatican borough to King Henry VII. of England. Some quotations from the instrument drawn up at the time will interest English students of this eventful period:—

"Rmus. in Xpo. pr. et dom. Hadrianus S. R. E. pres. carlis. tit. S. Crisogoni: Ex ratione benefitor. munerum ac meritor. que habuisse et suscepisse in rei veritate recognovit—confessus fuit et in futur. habere et suscipere sperat a Sermo. Dno Henrico Anglie Rege, de sua mera et gratuita voluntate liberalitate et largitate ac omni meliori modo via jure

causa et forma quibus magis et validius et efficacius fieri potest: donavit et donationis titulo. . . . concessit eidem Sermo. D. Henrico Anglie Regi absentem veluti presenti et suis heredibus et successoribus et cui vel quibus ipse Sermus. Rex et sui heredes et successores cedere donare et transferre voluerint etiam si pro natione Anglica in urbe Romana vel pro usu et habitatione oratorum sue regie maiestatis ad urbem et romanarum proficiscentibus et in urbe et Romana curia residentibus vel aliter quomodocunque et qualitercunque disponere voluerit et sue regie maj. vel suis heredibus et successoribus placuerit. . . . quasdam ipsius donatoris edes et edificia nondum perfecta insigni opere marmor. et lapidum tiburtinorum. ornata et ad non parvum Urbis decorem et splendor. de suo proprio et privato peculio et redditibus officior. suor. fabricatas. Que quid. edes site sunt in burgo Basil. B. Petri prin. apostol. in via Alexandrina cognominata per fel. rec. Alexan. pp. vi. noviter constructa, quib. a latere anteriori est dicta via publica Alexandrina, a latere posteriori est via Sixtina prope muros quib. itur ad castrum S. Angeli a latere versus palat. apostolicum est via publica prope domum et hortum Rmi. D. Francisci Caroli. Volaterrani ab alio latere versus castrum S. Angeli est via quam dictus R. D. Caroli. S. Grisogoni dimisit ad effectum quod dicta domus esset in insula prope dom. et hortum bo. me. Caroli. Aleriensis."

It needs hardly be added that the Cardinal's palace is no other building than the beautiful edifice erected by Bramante, known to-day by the name of Palazzo Giraud-Torlonia. For all I know it must have remained the property of the English crown till the days of Clement VII., when Henry VIII. emancipated his realm and church from Papal jurisdiction.

R. PAULI.

It is well known that the *Monumenta Germaniæ Historica* were started more than fifty years ago under the powerful influence of the great Baron Stein, the necessary funds being supplied by periodical votes in the Diet of the late Germanic Confederation. A learned society, "Die Gesellschaft für ältere deutsche Geschichtskunde," was to superintend the actual work and those engaged upon it. And even to this day there is at Frankfurt a committee of their members acting as trustees of the original founders and representing the rights of the various governments contributing the means, as long as federal principles prevailed in Germany. But not only the re-establishment of the empire under Prussian supremacy necessitates changes in the provision for this important branch of historical literature, but the old age of Dr. Pertz, who from the beginning has conducted the editorship nearly like a monarch, requires much more than a personal substitute. On the one hand the Royal Academy of Berlin is anxious to obtain the supreme direction of this truly national work, of which hardly the fourth part of the original plan has been completed. The public papers state that Professor Lepsius has been deputed by the Academy to settle matters with Dr. Pertz. On the other hand the Frankfurt committee is sure to raise the claims of the founders and contributors. It is, however, to be hoped that both sides may soon agree, as in that case they without doubt will find both the Prussian Government and the Imperial Diet most willing to continue the necessary supply of funds for a new and satisfactory arrangement in the editorial staff.

Since Ranke vacated his chair in the Berlin University and Jaffé died, great and not very successful endeavours have been made to promote the study of history in the capital of Germany. The enormous rise in the expenses of Berlin life are unquestionably in the way. Professor Nitzsch has been induced to remove from Königsberg to Berlin, but Waitz declined to leave Göttingen more than a year ago, and so did lately Dümmler of Halle. Two first-rate men are still required to support Droysen and Nitzsch, one for teaching history methodically, and another for the subservient disciplines of chronology, palaeography, and diplomatics. We are glad to add that according to the latest news Professor Wattenbach, at Heidelberg, has at last agreed to accept the latter chair, which nobody else is so competent to occupy.

On the 9th January died, thirty-five years old, at the vicarage of Leonberg, near Stuttgart, in the house in which both Paulus and Schelling were born, the son of the aged incumbent, Dr. Sigurd Abel, who after having been educated chiefly at Göttingen began to lecture there in mediæval and modern history. Soon after his promotion to a chair in the University of Giessen he was prostrated by a disease of the brain. He published a dissertation on the fall of the Lombardian realm in Italy, 1859; the first volume of the *Annals of the Reign of Charles the Great* for the Historical Commission at Munich, 1866; and, among minor papers, an essay on political parties in England, and the coalition between Fox and Lord North, in Sybel's *Hist. Zeltsch.* xvii.

There has been a rather unusual interruption in the publication of the "Generalstabswerk," the work which is to enshrine the memory of the German-French war of 1870-1 from the point of view of its greatest master, Field-Marshal von Moltke himself. The second "Heft," issued six months after the appearance of the first, treats chiefly of the days from the 1st to the 5th August, 1870, including the insignificant attack on Saarbrücken by the French, and their first defeat at Weissenburg on the 4th. Three excellent maps illustrate the

beginning of the great campaign, and will be undoubtedly reproduced by this time in the various translations preparing for military readers all over the world.

The Archæographical Commission of St. Petersburg is about to publish in that city a new edition of the Chronicle of Nestor according to the Lavrentievsky MS. The text will be accompanied with the principal various readings and a table of contents. It is edited by M. Byckov, chief librarian of the Imperial Library at St. Petersburg.

The second volume of the *Monumenta historica Poloniæ* by M. Bielovsky has appeared at Lemberg. It contains among other documents extracts from two chronicles of the German Monastery of Zwiefalten, of bulls and letters relating to Poland, fragments of the life of St. Otho of Bamberg, the chronicles of Mierzwa, of Vincent Kadlubek, of Boguchwal, and of John Garukow, and a certain number of year books or *roczniki*.

The Commission appointed by the Ministry of Public Instruction in Russia to arrange and publish the letters and papers of Peter the Great has commenced its labours under the presidency of Count Tolstoi, Minister of Public Instruction. M. Byckov has been chosen secretary of the Commission.

### Philology.

Unexplored Syria. Visits to the Libanus, the Tulûl el Safâ, the Anti-Libanus, the northern Libanus, and the 'Alâh. By Richard F. Burton and Charles F. Tyrwhitt Drake. Two volumes. London: Tinsley Brothers.

IN this work Captain Burton communicates the most important results of a stay of almost two years in Syria. The whole of it was occasioned and influenced by him, though only about half comes directly from his pen. What we here receive inspires us with extreme regret that the author was so soon called away from his post in Syria, as well as that his friend Tyrwhitt Drake failed to meet with that support from his countrymen which he had a right to expect. Captain Burton leaves the reader to divine the motives of his antagonists, but we receive the impression that he is fully justified in his complaints. No doubt so impetuous, energetic, and "subjective" a spirit may here and there have given unnecessary offence; the conflict with the Turkish authorities can hardly have arisen simply and solely from their own baseness, and it might at the outset be questionable to entrust a man with the care of English interests in Syria, of whom it could not remain a secret that he had committed that terrible offence in the eyes of a Muslim of having made the pilgrimage to Mecca as a Christian. For all this there seem to have been hostile influences at work which are the reverse of creditable.

It was well known that much yet remained to explore in Syria; yet it is certainly surprising to learn that even regions in the immediate neighbourhood of Bairut and Damascus had so escaped attention that Captain Burton had to make out the character of the ground for the first time. The excursions in Libanus, Anti-Libanus, Trachones, and the 'Alâh, described by Mrs. and Mr. Burton and Mr. Tyrwhitt Drake, add much new information about the topography, which will correct the very best maps in essential particulars.

Even one who had never seen Syria might be pretty certain that it was not a land rich in beautiful scenery, and that even the admired Damascus derived its principal charm from its contrast to the desert: but this is not enough for Captain Burton. According to him both Libanus and Anti-Libanus are deficient in almost all the elements of beauty and sub-

limity. The irrigation is generally insufficient; whole districts are completely waterless. Trees were sorely missed; there were only two places in all Syria where Captain Burton saw anything which could be called a forest, viz., on the west slope of Hermon. The famous cedars are represented as "a badly-clad, ill-conditioned, and homely growth; essentially unpicturesque, except, perhaps, when viewed from above." As far as a small but good photograph enables me to judge, the description is not exaggerated. The forms of the mountains too are said to be seldom beautiful or imposing. No doubt the judgment of the author may be somewhat influenced by the fact that he had previously seen the lofty beauty of the Andes. The very similarity of the relation of the double chain of the Andes to the coast extended before it to that of Libanus and Anti-Libanus to Phœnicia could not but make these landscapes seem petty and unattractive. It must be mentioned that Tyrwhitt Drake found beautifully wooded parts in the north of Libanus, which reminded him of northern regions. But even if Captain Burton is somewhat too disparaging towards the beauties of Syria, there have been much greater exaggerations on the other side. He is quite right in ridiculing the malady which he calls "the Holy Land on the brain;" the fascination exercised by religious romance on most cultivated visitors of Syria and Palestine, particularly on the Protestants, and most of all on the English and Americans, a fascination which deludes by the appearance of landscape beauties which have no real existence. It is some excuse that most travellers, coming direct from the dim atmosphere of the north, have their first experience of a transparent air and a clear sky in Syria, so that forms and colours seem quite otherwise to them than at home. Besides, it is not only travellers who are taken ill with "the Holy Land on the brain," but students of that country's literature. What a bright picture is often drawn of the great days of King David, though the repeated revolts and the family dissensions show that it was very questionable felicity.

The sobriety of the author's estimate, however, has not impaired his interest in countries which have been so influential for the weal and woe of humanity. He is well aware of the high importance of Syria, and insists that every inch of the ground should be thoroughly explored. He has examined not only the topography, but the ruins. He too finds that there is very little remaining above ground in Syria of greater antiquity than the time of the Romans. He justly ridicules those who see in the buildings of the Haurân, which are mostly of the Christian period, the cities of the gigantic king Og. It is pointed out that the notion of a greater stature among primitive nations is contrary to all reasonable experience. The only question that remains is, how to explain the wide prevalence of such a view on psychological grounds.

Although the inhabitants of Syria are better known to us than its soil, I cannot help wishing that the author had spoken at greater length about the former; what he gives us only whets the appetite for more. His opinion of the population is on the whole as favourable as his account of the government is the reverse. I almost fear that it is a little too favourable. He tells us himself how untruthful, covetous, and ungrateful the Syrians are. And some of the proverbs of the Damascenes which are published in this work imply a terrible degree of insincerity; e.g. No. 74, "The hand which you cannot bite, kiss it, and pray that it may be broken." It is easy, of course, to make the misgovernment of centuries responsible for such features in their character; at any rate it would be a task of extreme difficulty even for a good government to produce passable fruits from such a soil. We must certainly agree with him, that the roads and rail-

ways of the future will be the principal factors in the civilization and moral elevation of the inhabitants of Syria. He evidently expects more from these than from the activity of the Protestant missionaries. I wish so independent a man had given a public opinion of the real and pretended results of these agents. For the rest, this book furnishes us with additional evidence of the uniform superiority of the Muslims to the Christians in the Semitic countries. Tyrwhitt Drake, in particular, gives a most unfavourable account of the Syrian Christians; he remarks, no doubt with justice, that the reprehensible features in their character stand in a certain relation to their religion (that is, to the form which Christianity has assumed among them). Precisely the same estimate is given of the Copts of Egypt by all good observers, and that these are not only the sad consequences of political and social oppression is clear from the yet lower moral condition of the Abyssinians, who have had a constant succession of national and Christian rulers. It is true that both the United and the non-United Nestorians in the far East are, apparently, more advanced in the moral scale. But the only Christians of the East proper who to all appearance have a real future before them are the non-Semitic Armenians.

There are also very interesting communications on the migration of the Druses to the Haurân. Disgraceful as this migration is for the government, Captain Burton considers it fortunate for the country. The industrious Druse peasants in their easily defensible mountains form a bulwark against the Beduins—for it is still the first requisite of civilization there, as it was in the time of Gideon, that the robbers of the desert should be restrained. It is true, however, that the establishment of the Druses in the ruined cities of the Haurân is fatal to the ancient buildings of which they are composed. He naturally despairs of any changes in the Turkish policy for the advantage of Syria. Yet it is very doubtful whether a native government would be in any respect better than the Turkish. Our own immediate wishes, like those of the author, must be for a really energetic policy on the part of England, for though the influence of the latter is here said to be on the wane, no other power is in a position effectually to advance the interests of culture and progress.

Praiseworthy pains are bestowed on the orthography of Arabic names. Here and there we even observe the use of the Arabic geographers, though it is true that they have not been made to yield their utmost of illustration. I may mention for instance, that the view that *'Anjar* is contracted from *'Air (al-)jarn* is confirmed by Yâkût. The linguistic failings of Captain Burton should have been unmentioned were it not that he takes a capricious pleasure in giving philological explanations, particularly of proper names. Success was all the more improbable, as Arabic is far from sufficient in those regions; in Syria, especially in Lebanon, there are still many Aramaic names. No one can demand of Burton that he should have studied the Semitic languages and antiquity in a strict historical and philological school; but for this very reason he should have been more circumspect in referring to such subjects. A more thorough knowledge, for example, would have prevented him from praising the well-intentioned but wholly unripe work of Dr. Inman, *Ancient Faiths embodied in Ancient Names*.

Among the various appendices I have already mentioned the collection of proverbs of Damascus. They are throughout expressed in the modern dialect; though I have found at least one which, derived from a poem in the classical language, has still preserved even its metrical form (No. 134). The paraphrases and short commentaries will be welcome even to those Arabists who have devoted themselves more than I have done to vulgar Arabic.

The work derives a special importance from its inscriptions. It presents us with the first exact copies of those of Hamah, which would not improbably, even if they contained little but proper names, throw a new light on the ancient history of northern Syria, if we could only decipher the entirely unknown characters in which they are written. Unfortunately there is not the remotest prospect of our being able to do so. The writing consists of several hundred characters, and the language is entirely strange; so that the discovery of bilinguals would be our only hope of success. Without them, it would have been impossible to attempt the decipherment either of the hieroglyphics or of the cuneiform inscriptions. Thankworthy as Mr. Hyde Clarke's statistical data are, his comparison of single characters of these inscriptions with similar ones of known alphabets of an entirely different type is not likely to be more fruitful than his fantastic ethnological hypotheses. Whether the decipherment of the Cyprian inscriptions, which is at least not yet to be despaired of, will throw any light on the stones of Hamah, time alone can show. The conjecture is at any rate justified, that these carefully wrought inscriptions are of extreme age, and belong perhaps to the ancient Cheta (of whose identity, by the way, with the Hittites of the Bible I am not yet thoroughly convinced).

Captain Burton also gives four other Oriental inscriptions, which, however, deserved to be copied more accurately. This is evidently the case with the single Arabic one (vol. ii., plate 1), which is composed in good Kūfī, and must be easy to read in the original. It is the funerary inscription of one 'Abd-assamad b. Marwān al. . . . , and is preceded by two passages of the Koran (Sur. 3, 16; 37, 180-182); I fail to make out the date from the copy. Of the other Arabic inscription (*ibid.*), in the florid Kūfī which was much in vogue at certain times in inscriptions on buildings, all that I can make out for certain is the well-known introductory formula, "In the name of God," &c. As for the inscription at the right hand top corner of the same plate, I am not even certain whether it is Kufic or Nabatean; the drawing given at page 115, vol. ii., is altogether undecipherable. The great mass of Captain Burton's inscriptions are Greek. Some of them had been already given by Waddington and Wetzstein, and since the copies of the former accomplished epigraphist are on the whole, as might be expected, far the best, Mr. Vaux, to whom Captain Burton entrusted them, may be excused for determining not to publish the fresh copies. It would have been still better, however, to print them, since even the best transcript is liable to errors, which another, favoured by a better light or more abundant leisure, may perhaps avoid. It is also important, when a strange or peculiar reading is in question, to have its existence established by more than one copy; this remark applies to the large number of inscriptions which, in spite of the arrangement referred to, are given by Captain Burton as well as by M. Waddington—among them is the long funerary inscription on pp. 160-163 (see Waddington, 2145 a-c, Wetzstein, 129). It is true that the superiority of Waddington's copies is brought out all the more clearly by the comparison; notice, for example, the round Sigma in Burton 147, whereas Waddington 2154 expressly affirms the indented Σ, which is also given in Wetzstein 138. In Burton 56 a whole series of characters is wanting in the middle; see Waddington 2537 a, &c. Unfortunately this overlooking of the inscriptions already published is only a small instance of the manner in which Mr. Vaux has acquitted himself of his task. Captain Burton could not easily have found a man less fitted to edit the inscriptions. His readings abound with blunders which would be discreditable even in a beginner. Words

which are perfectly legible were to him undecipherable. This may give some idea of the probability of his attempts to fill up lacunæ. It is difficult to believe that he has devoted even one careful perusal to M. Waddington's work, besides which he is clearly deficient in the requisite knowledge of facts. I am really astonished that one who belongs to the most Bible-loving of nations is so little at home in the Psalms that he fails to recognize the simplest quotations from them, though they were from the first to be expected in such Christian inscriptions. If, for instance, he had observed that No. 15 is composed of Ps. cxvii. 26, 27 (according to LXX.), lxvi. 10, lxvi. 4 (ἱλασε=ἱλάσαι), he might have spared his marks of interrogation and erroneous supplements; and so too with No. 24 (Ps. iii. 7, &c.), No. 60 (Ps. cxxvi. 1, an appropriate passage, and one that often recurs in inscriptions of this kind), and others. In No. 20 the reading is quite distinct, ἐόξα πατρι καὶ [ι] Ὑ[ι]ῷ καὶ ἀγίῳ Πν[έ]υμ. ὁ βοηθῶν Σαβίν[ω], with an error of syntax which is not unfamiliar in these inscriptions for τῷ βοηθῶντι Mr. Vaux, however, reads ἐόξα πατρι καὶ [ι] υψιστῶ καὶ ἀγίῳ πνεύμ[ατι] βοηθῶν [βοηθεῖ] Σαβίν[ω]—which would produce a new phase in the development of the dogma of the Trinity, according to which the latter was composed of the πατήρ, the Ὑψιστος, and the πνεῦμα. But let church historians beware of making use of this discovery! Several inscriptions Mr. Vaux has not been able to read at all, though they can be deciphered either in whole or in part without any great trouble. In short, this whole part of the work is *thoroughly unsatisfactory*, and it is urgent that such important material should soon be thoroughly well edited over again by a competent scholar.

The character of these Greek inscriptions is sufficiently known from Waddington; they supply us in points of detail with many valuable notices. In Burton as in Waddington there are but very few Semitic proper names in the inscriptions from north Syria, while there are several in those from the Hauran and the neighbouring districts, some of which were hitherto unknown. The language of the inscriptions presents the usual peculiarities. If we may rely to some extent on the exactness of the transcriber, No. 136 exceeds all that was previously known in barbarisms of language;—τοῦτον μνημῖον τοῦ Γουζάδου (?) καὶ ἐκτεσεν (i.e., ἐκτίσεν) αὐτὴν Μάξιμα γυνὲκο (= γυνή). But it is possible that a few letters have to be supplied after γυ, and that the first word should be read τοῦτο τό. There is one versified inscription (No. 34), which is mutilated at the beginning; it is composed till near the end in iambic trimeters.

The book contains an additional contribution to epigraphy in a discussion of the inscription of King Mesha, which, however, so far as it is new, will scarcely be approved by the best scholars.\* Undoubtedly there are a few discrepancies between the inscription and the Old Testament with regard to which the authentic record is naturally of much greater importance than the partly legendary notices; but Captain Burton very greatly exaggerates the magnitude of these discrepancies, not observing that the stone must have been set up before the siege, and before the sacrifice of the king's son. There is no reason at all for doubting the latter event; the raising of the siege was, no doubt, regarded by the Moabites, and indeed the Israelites too, as a result of the assistance which Kamosh, reconciled by the sacrifice, once more vouchsafed to his people. Of more interest are the author's remarks on the melancholy history of the discovery and destruction of the stone. On the whole one must agree with him, though there may be room for difference of opinion on some minor points. It was a piece of negligence, astonish-

\* Cf. our remarks on Captain Burton's two papers on the Moabite stone in the Athenæum (*Academy*, vol. iii., p. 180).—ED.

ing even in a missionary, that Mr. Klein took no copy of the inscription; and my distinguished friend Petermann has shown that one can be a most learned man and yet not have the diplomatic gifts which are desirable in such negotiations with Orientals. Everyone who knows the circumstances is convinced that had Dr. Wetzstein been in Mr. Petermann's place, he would have secured the stone. Lastly, it must always be fully admitted that M. Gauneau has the merit of having rescued what remained of the stone to rescue.

Mr. Tyrwhitt Drake's essay on the rules followed by the Jews in writing the Pentateuch-rolls was hardly called for. It is chiefly based on Maimonides, contains scarcely anything new to the scholar, and is unnecessary for the general reader. The well-known Mr. Shapira was here the author's mentor; one is almost led to suspect that he wished to do business with certain Pentateuch-rolls in his possession, which he would make out to be older than the Mishna. That the author of this essay is not accurately informed with regard to the critical questions at issue, that, for instance, he places the *Megillath Sophirim* too early, is an excusable fault.

I can form no judgment as to the value of the purely scientific portions of the work, but may be allowed a suspicion that they might without detriment have been condensed. What, for example, is the good of repeating the tirades of the Abbé Richard (vol. ii., p. 294, &c.) against the high antiquity of the human race?—a fact of which no one is any longer in doubt, except those who are guided by *dogmatic* considerations.

It was only natural to form high expectations of the map attached to the work, especially as a severe judgment is passed on the current maps of Syria. Unfortunately our hopes are disappointed. The scale itself is too small, and the places which occur in the text are not all to be found. The map even embodies views which are rejected in the text of the work, e.g., the identification of the Lithani with the Leontes, against which it may also be urged that, as far as I can see, the name of Leontes does not occur at all in Greek and Latin literature. The map of the 'Aláh, which is referred to in the text, is altogether wanting. At any rate it is to be hoped that a really good map, or rather several maps, will be given in a second edition. The rest of the illustrations are of no great pretensions, but quite adequate to their purpose.

It was inevitable that the review of a book which the author himself calls a *pot-pourri* should present a slightly motley appearance; let me add once more expressly, in conclusion, that the work is, in spite of some defects, a highly meritorious one. TH. NÖLDEKE.

P.S.—A very interesting section of the work describes the structures to which the lake of Homs is due. It is a remarkable confirmation that the careful writer Abulfidá (circ. 1300 A.D.) describes this lake, which was in his native place, in quite similar terms to those of Mr. Burton, and also affirms its artificial origin. The erection of the great dam is, according to him, attributed by some to Alexander. But Jewish authorities of much greater antiquity (see Neubauer, *Geographie du Talmud*, pp. 24, coll.—though I cannot follow him in his interpretation of many of the passages) say expressly that *Diodetian* laid out the lake of Homs. It would be very desirable that the correctness of this assertion, to which I attribute great authority, should be tested by competent archæologists.

**Morkinskinna.** Pergaments-bog fra første halvdel af det 13de aarhundrede, indeholdende en af de ældste optegnelser af Norske Konge-Sagaer, udgiven af C. R. Unger. Christiania, 1867. (As a University program).

THE *Morkinskinna*, or the "Rotten Skin," thus called by Torfæus, because of its singed, black, and rotten con-

dition, is now preserved among the Icelandic vellums in the Royal Library at Copenhagen (the Old Collection, No. 1009 fol.), and was brought thither from Iceland in 1662 by Torfæus with ten or twelve other vellums (the Eddas, the Flatey-Book), all being a present from Bishop Brynjolf to the King of Denmark. The volume is written about the middle of the thirteenth century and in two handwritings; it is defective by several leaves in the middle, and mutilated at the end; besides, the edges and corners are singed, burnt, torn off, and blackened, so that it is very difficult to read; sometimes it baffles all decipherment; happily a text of the same family, although of a later date, is preserved in the third and last handwriting of the Flatey-Book, as also in the Fagrskinna, from which sources the text can be supplemented, and lines filled up, which is often done in the Edition, these insertions being marked with small types.

The text of the *Morkinskinna* consists of the Lives of the kings of Norway, but only beginning with King Harold Hardradi, then running on probably (for the end is missing) down to King Sverri. The text bears often the marks of great antiquity, and seems to represent a text older than Snorri's. The genealogies are carried down to about 1220 (Skúli is, p. 122, called "Earl," which he became in 1217); a Swedish king, Jon Sörkvissun (1216-1222) is named "King Sörkvir, father of King John," p. 169; the MS. itself cannot be of much later date. A chief ornament of the text are the many inserted episodes, which are here told in a better, quainter, and more original form than in any other text (the Hulda not excepted), containing old words, forms, and phrases, which in the other texts have been obliterated and replaced by more common words, e.g., many instances of the suffixed verbal negative. Of all the old recensions this comes nearest to the lost Hryggjarstykki, by Eric Oddsson, especially in the saga of Sigurd Slembi. The writer seems to have had that work lying before him, so that sometimes we have the very words of the lost original; it also contains two or three fresh anecdotes—e.g., the story of the poet Einar Skulason, not found elsewhere. In the Saga of Harold Hardradi, the story of Hakon Ivarsson (p. 81-93), and his falling out with the king, are here told in a much better and truer shape than in any of the other recensions; the text of the Hulda (Fms. vi.) is here inferior, not to speak of the Heimskringla. The same text is contained in the third handwriting of the Flatey-Book, which is to be regarded as a sister vellum to our *Morkinskinna*. The account of the invasion of England under King Harold (p. 109-120) agrees with the text in Fagrskinna, containing many improvements, although chiefly in words and phrases, on the other texts, and deserves to be consulted by every student of those events.

We noticed, in a former article, the minced and mutilated text of the Heimskringla in her latter parts, owing to the unskilled hand of compilers or abridgers, who strove to contract sentences, skipping now and then from one full stop to another. Mr. Freeman (in his work, vol. iii., p. 366, the footnote) says that the Icelandic saga "oddly enough" does not relate the death of Earl Tostig in the battle of Stamford-bridge. This is true, but only of the Heimskringla text, for the compiler happens here to have skipped over a whole sentence—leaping from one full stop to the next, not from any inadvertency as a transcriber, but, as in a hundred other instances, in order to make a short cut. The text of the Hulda, as well as that of the *Morkinskinna* and the Fagrskinna, presents here the full text; thus the *Morkinskinna* says (p. 119): "This fight was hard, but not long; there was a great manslaughter in the ranks of the Northmen. The Earl fought bravely, following the standards, but at last he fell

there with great valour and good fame." Add another instance even more telling, but not bearing on the history of England. We find in our sagas the lives of the kings of Norway, but not of the Norse people; thus it happens that we find but scanty accounts of Norse law-suits (such as, e.g., for Iceland, are contained in the excellent *Njála*, and everywhere in the sagas). For Norway there are only two chief sources—a chapter in the *Egil's saga* referring to the tenth century; but a still better and more authentic report is contained in a special narrative, called *Thinga-saga*, a law-suit between the two brother-kings, Sigurd and Eystein, of the beginning of the twelfth century, where the parties appealed from one court and law-parliament to another. This highly interesting narrative, clear and lucid when read in the *Hulda* (Fms. vj.), or in the *Morkinskinna*, p. 174-185 (inscribed, "*þinga-saga milli Sigurðar konungs ok Eysteins konungs*"), is in the *Heimskringla* given in a very much abridged text, faulty and confused, misstating even the local names—a worthless and bewildering compendium. In fact, the legend of the excellency of the text of the *Heimskringla* above all other texts, as held up by Peter Erasmus Müller, has to be discarded, or has to be upheld *cum grano salis* according to inner evidence; and historians who wish to consult the Icelandic sagas have constantly to bear this in mind.

G. VIGFUSSON.

#### THE RÂMÂYANA AND HOMER.

To the Editor of the ACADEMY.

SIR,—In drawing the attention of your readers to the patriotic indignation of some learned Hindoos against my paper on the *Râmâyana*, the author of the article "Intelligence" in your No. 65, p. 58, states its purport in the following terms:—"The paper referred to attempts to prove that Vâlmiki, the composer of the Hindu epic, was acquainted, either directly or indirectly, with Homer's *Iliad*; and that the main plot of his composition—the abduction of Sîtâ to Lankâ (Ceylon), as well as several other incidents—were taken from the Greek poem."

I beg to decline this representation of my views as a true one. What I maintain is simply this:

"It is possible that in the addition of these two elements (the abduction of Sîtâ by Râvana and the siege of Lankâ) to the earliest form of the story told in the *Râmâyana*—as we find it in the Buddhist legend—we should recognize the influence of an acquaintance on the part of Vâlmiki with the Homeric *saga-cycle*, just as other stories belonging to the cycle have found their way into the Buddhist legend." (Boyd's translation in the *Indian Antiquary*, 1872, p. 252.)

"I do not imagine that he (Vâlmiki) had himself studied Homer, or even that he must have been aware of the existence of the Homeric poem." (Ibid., p. 173.)

"I content myself with the simple assumption that in consequence of the mutual relations which Alexander's expedition into India brought about between the inhabitants of that country and the Greeks, some kind of knowledge of the substance of the Homeric story found its way to India." (Ibid.)

I have not seen the "dignified" review of my essay by *Kâshindh Trimbak Telang*, who "endeavours to refute my arguments one by one;" but as "he lays particular stress on the total want of correspondence in the delineation of the various characters introduced in the two poems," it appears from the foregoing statement of my real opinion, that he fights as much against windmills as Bâbû Râjendralâl Mitra does, who has "succeeded" in "ridiculing and condemning" in a "bantering and ironical style," and to "demolish with great effect" MY (!) theory: "that the *Râmâyana* of Vâlmiki is simply an Indian translation of Homer's *Iliad*." (*Hindoo Patriot*.)

Lassen wir ihnen dies unschuldige Vergnügen!

Allow me to add besides a short remark on a notice of *Bhandarkar's* able article on Patanjali's age, in the same No. of the *Academy*, p. 59. The very passage adduced by Bhandarkar as pointing out King Push-

pamitra as a contemporary of Patanjali has been adduced already *twelve years ago* (1861), in my reply on Goldstücker's preface to his *Mânava Kalapasûtra*, *Indische Studien* V, 150, where the whole question on Patanjali's age is moreover treated in the sequel (to p. 169), with many important details left untouched by its recent investigator. I gave there the name of the king, in accordance with the Tibetan sources, as Pushyamitra, but Professor Bühler informs me that the Jains spell the name in their Mâgadhi-texts, Puppamlitra, which gives Pushpamitra as the right form.

A. WEBER.

Berlin, Feb. 25, 1873.

#### Notes and Intelligence.

*Hymnes Sanscrit, Persiens, Egyptiens, Assyriens et Chinois. Chi-King, ou Livre des Vers, traduit pour la première fois en français par G. Pauthier.* Paris: Maisonneuve. The second volume of the *Bibliothèque Orientale* (a collection of the chefs-d'œuvre of Oriental literature) derives its sole scientific importance from translations of Egyptian and Assyrian hymns. Most of these have been hitherto completely unpublished. The triumphal hymns of Tutmes III., and of Ramses II., and a hymn to Osiris and Ra, are rendered by the late Vicomte de Rougé, some invocations by Chabas, hymns to the Sun by Lefébure, and the complaints of Isis and Nephthys by Horrack. The Assyrian portions are due to M. J. Oppert.

Dr. Geitler has recently published in the Bohemian language, a *Phonology of the ancient Bulgarian*, with relation to the Lithuanian.

Dr. F. Kielhorn, principal of the Deccan College at Poona, has just completed the second part of his translation of the *Paribhâshenduskhara*. The third and last part is expected to follow in about three months.

**The Indian Antiquary.**—A journal of Oriental Research in Archaeology, History, Literature, Languages, Philosophy, Religion, Folklore, &c. Edited by Jas. Burgess. Vol. I. Bombay. 1872.

On the completion of the first volume of Mr. James Burgess' *Indian Antiquary*, a monthly journal devoted to Oriental, and more especially Indian, research, which has already rendered good service in several branches of literary and antiquarian inquiry, a few remarks on the work it has hitherto done may not seem out of place in these columns devoted to literary and scientific criticism. When in the beginning of last year Mr. Burgess put forth the first number of his periodical, accompanied by a prospectus promising information on almost any subject that is likely to interest those who inquire into Indian antiquity, many must have given a hearty welcome and wished success to what bade fair to become a useful medium of communication between the Oriental scholars and archaeologists in the east and west. There can be no doubt that scholars in India especially had long felt the want of a record of this kind, ready to receive and at once publish, along with communications of higher pretensions, any observations or statements which, though unsuited to the journals of Asiatic societies and other institutions, might prove of interest or bring on discussions, and thus aid the progress of science.

It must now be satisfactory to Mr. Burgess, in glancing over the list of contents of his first volume, to have been able during the past year to avail himself of the services of so many of the best known scholars in India. Nor is it likely that any of his subscribers should feel disappointed at the result of the co-operation of so many able contributors. Those who make the ancient literature of India the object of their study cannot but have read with much interest the accounts given by Dr. G. Bühler of several rare works which he has had the good fortune of discovering during his recent official search for Sanskrit manuscripts, such as Kshemendra's *Vrihatkâtha*, Hemachandra's *Deśabhasya-sangraha* and others; or the papers of Messrs. A. Burnell, K. T. Telang, and Profs. Bhandarkar and Sashagiri Sâstri on various interesting questions of Sanskrit literature. Whilst the contributions of Messrs. Beames, Growse, and Hoernle throw some new light on the literature and philology of some of the northern vernaculars; Mr. R. C. Caldwell has given some specimens of Tamil popular poetry; and the Rev. F. Kittel has attempted to determine some Dravidian elements in Sanskrit, and has moreover given an account of a newly discovered Ancient Canarese Dictionary, by Manga Râja, which appears to be of considerable value. On Hindu folklore, also, there are some interesting communications by the editor, by Dr. Leitner, and Messrs. Damant and Benett.

It is, however, to archaeological, geographical and historical inquiries that most space has been allotted in the columns of this journal. The volume contains a number of copies of valuable inscriptions appertaining to various dynasties, with translations and remarks by Profs. Bhandarkar and Shankar Pandit, and Messrs. J. F. Fleet and B. L. Rice; and some inscriptions from Ceylon, with explanatory notes by Mr. Rhys Davids. Prof. Blochmann has contributed several biographical notices of grantees of the Mughul court, chiefly extracted from a Persian work, entitled *Madsir ul Umard*; and Bâbû Râjendralâl Mitra, Messrs.

Ramsay, Narasimmiyengar, Col. Mackenzie, and others have severally illustrated some points of historical or antiquarian interest. The editor has also printed an English translation, by the Rev. D. C. Boyd, of Prof. Weber's essay on the *Rāmāyana*, which has already been ably reviewed elsewhere by Mr. K. T. Telang, and which it would be interesting to see discussed by other Hindu scholars in the columns of this journal. It is to be hoped, in the interest of Oriental studies, that the existence of so useful a record as Mr. Burgess' *Indian Antiquary* has already proved to be may never be endangered by want of that encouragement and support to which it is fairly entitled.

J. EGGEING.

The current number of the Bengal Asiatic Society's journal contains a highly interesting and important essay, by Bábú Rajendralála Mitra, on the use of beef in Ancient India. The writer adduces abundant passages from Vedic texts and law-books as well as from later works which show clearly that, whatever may be the feelings of Hindus on this subject nowadays, beef was a staple article of food with their forefathers. "The idea of beef," remarks the Bábú, "the flesh of the earthly representative of the divine Bhagavati as an article of food is so shocking to the Hindu, that thousands over thousands of the more orthodox among them never repeat the counterpart of the word in their vernaculars; and many and dire have been the sanguinary conflicts which the shedding of the blood of cows has caused in this country. And yet it would seem that there was a time when not only no compunctious visitings of conscience had a place in the mind of the people in slaughtering cattle; when not only the meat of that animal was actually esteemed a valuable aliment; when not only was it a mark of generous hospitality, as among the ancient Jews, to slaughter the 'fatted calf' in honour of respected guests, but when a supply of beef was deemed an absolute necessity by pious Hindus in their journey from this to another world, and a cow was invariably killed to be burnt with the dead. To Englishmen who are familiar with the present temper of the people on the subject, and to a great many of the natives themselves, this remark may appear quite startling; but the authorities on which it is founded are so authentic and incontrovertible that they cannot for a moment be gainsaid."

Bābū Rājendralāla Mitra has also issued the fifth fasciculus of his "Notices of Sanskrit Manuscripts," comprising Nos. 678-787. The manuscripts described in this part are most of them copies of philosophic (chiefly *Velānta*) works and commentaries, and manuals of Vaidik and sectarian ritual. A rather curious compilation is noticed under No. 731: *Viśvakarmīya Śilpa*, a treatise on the manual arts, attributed to Viśvakarmā, the divine architect. The MS., which belongs to Bābū Rājendra, is said to have been copied from an old code in the library of the Rājā of Tanjore, which is written in the ancient Canarese character. Among the MSS. noticed is also an old, though incorrect, copy of the *Upagrantha-Sūtra* (No. 777), one of the ten Sūtras of the *Sāmaveda*, of which one MS. only (India Office 121) exists in Europe.

### Contents of the Journals.

**Journal Asiatique.** January.—Buddhic studies; by M. Feer. [On "The Friend of Virtue" and "The Friendship of Virtue," with new texts.]—The actual metric system of Egypt; by Mahmoud Bey.—Miscellaneous. Notice on ancient formulæ of incantations, &c., in a language anterior to the Babylonian. [Contains a sketch of Accadian grammar. From its imperfection and errors it appears to have been written some years ago. The more correct account of the facts will be found in M. Lenormant's *Études accadiennes*. It is followed by a good and ingenious translation of a tablet of exorcisms (*W. A. T.* ii., 17, 18).]—Porter Smith on the Materia Medica and Natural History of China.

**Revue archéologique.** February.—The most ancient inscription in Assyrian; by M. Lenormant. [This is a Semitic inscription of an ancient Accadian king of Ur on a black stone. It is valuable as showing Semitic influence in Babylonia at an earlier period than has hitherto been suspected.]

**Zeitschrift für deutsche Philologie.** IV. 4. Halle.—Ueber die scheinbare Verwechselung zwischen Nominativ und Accusativ; L. Tobler. [Explained as the result partly of phonetic, partly of syntactical laws. The endings become confused and partially levelled from phonetic decay, and the process is further assisted by various syntactical constructions which admit the use of nominative or accusative indifferently. The illustrations are drawn chiefly from the German dialects of Switzerland, with occasional reference to English and French.]—Bemerkungen zum Redentiner Osterspiele; Fr. Drosihn. [Corrections of the text, and explanation of difficult passages.]—Zur livländischen Reimchronik; Leo Meyer. [Remarks on the MSS., with corrections of the printed texts, and dissertations on special words and phrases.]—Zur älteren Edda; J. Zupitza. [A series of explanations and emendations, of which the most important is the reading *kendi* (=wies) for *kundi* in Sgkv. 3, 3, 6: *ok æg akunni*.]

**The Indian Antiquary**, ed. J. Burgess. Part XII. Bombay, December, 1872.—On a Copperplate Grant from Balasore; by F. Beames.

[This plate is in the possession of the Bhuyâns, a family of Zamindars at Garhpada, about fifteen miles north of Balasore. It records a Grant by Râjâ Purushottama Deva, King of Orissa, and is dated in the fifth year of the king's reign (A.D. 1483).]—On the derivation of some peculiar Gaurian verbs; by the Rev. A. F. R. Hoernle. [By the term *Gaurian* the northern vernaculars are designated; the paper treats of a class of verbs in these dialects with a special base derived from the past participle.]—The Merkara Plates; text and translation by B. L. Rice, with remarks by the editor and R. G. Bhandarkar. [An important inscription of the Chera dynasty, dated in 388, probably of the Saka era=A.D. 466.]—The Lady and the Dove: a Bengali song, composed by a Hindu female; by Rev. J. M. Mitchell. [Text and translation in English verse.]—Facsimile of a Persian map of the world, with an English translation; by E. Rehatsek. [The original belongs to a Muhammadan at Junner, in the Bombay presidency.]—On some Koch words in Mr. Damant's article on the Palis of Dinapur; by J. Beames.—Archæology in the Krishna District. [Extracts from a report by the late J. A. C. Boswell, continued.]—Three Maisur Copper Grants; by V. N. Narasimmiyengar. [Text and translations of some forged Copper Grants purporting to have been executed in the reign of King Janamejaya at the beginning of the Kaliyug.]—Dr. Bühler's Report on Sanskrit MSS. in Gujarat. [Dr. B. informs us that as soon as the fourth part of his catalogue will have been issued, supplementary lists will be printed; and that considerable progress has been made in cataloging Jaina libraries. The number of MSS. purchased during the year amounts to 421, among which there are several valuable works. The collection of Jaina books at Bombay is said to be now larger than any other public collection: there are copies of nearly all the sacred works and commentaries, both old and new, on most of them.]—Correspondence.

## UNIVERSITY OF LONDON.

Notice is hereby given, that on Wednesday, 30th of April next, the Senate will proceed to elect Examiners in the following departments:—

Examinerships. ARTS AND SCIENCE.	Salaries (Each.)	Present Examiners.
Two in Classics .....	£200	{ Rev. Dr. Holden, M.A. R. C. Jebb, Esq., M.A.
Two in <i>The English Language, Literature, and History</i> .....	£120	{ J. G. Fitch, Esq., M.A. Prof. Henry Morley.
Two in <i>The French Language</i> .....	£100	{ Prof. Cassal, LL.D. Gustave Masson, Esq., B.A.
Two in <i>The German Language</i> .....	£30	{ R. Rost, Esq., Ph.D. Rev. C. Schoell, Ph.D.
Two in <i>The Hebrew Text of the Old Testament, the Greek Text of the New Testament, the Evi- dences of the Christian Religion, and Scripture History</i> .....	£50	{ W. Aldis Wright, Esq., M.A. Vacant.
Two in <i>Logic and Moral Philosophy</i> .....	£80	{ Rev. John Venn, M.A. Vacant.
Two in <i>Political Economy</i> .....	£0	{ Prof. T. E. Cliffe Leslie, LL.B. Vacant.
Two in <i>Mathematics and Natural Philosophy</i> .....	£200	{ Prof. H. J. S. Smith, LL.D., F.R.S. Prof. Sylvester, LL.D., F.R.S.
Two in <i>Experimental Philosophy</i> .....	£100	{ Prof. W. G. Adams, M.A., F.R.S. Vacant.
Two in <i>Chemistry</i> .....	£175	{ H. Debus, Esq., Ph.D., F.R.S. Prof. Odling, M.B., F.R.S.
Two in <i>Botany and Vegetable Physiology</i> .....	£75	{ Vacant. Thomas Thomson, Esq., M.D., F.R.S.
Two in <i>Geology and Paleontology</i> ..	£75	{ Prof. Duncan, M.B., F.R.S. Prof. Morris, F.G.S.
LAWS.		
Two in <i>Jurisprudence, Roman Law, Principles of Legislation, and International Law</i> .....	£100	{ Prof. Bryce, D.C.L. T. E. Holland, Esq., B.C.L., M.A.
Two in <i>Equity and Real Property Law</i> .....	£50	{ H. H. Cozens-Hardy, Esq., LL.B. Vacant.
Two in <i>Common Law and Law and Principles of Evidence</i> .....	£50	{ Farrer Henschell, Esq., B.A., Q.C., H. Matthews, Esq., LL.B., Q.C., M.P.
Two in <i>Constitutional History of England</i> .....	£25	{ Prof. Sheldon Amos, M.A. Prof. Courtney, M.A.
MEDICINE.		
Two in <i>Medicine</i> .....	£150	{ J. Syer Bristowe, Esq., M.D. Vacant.
Two in <i>Surgery</i> .....	£150	{ John Birkett, Esq., F.R.C.S. Prof. John Marshall, F.R.S.
Two in <i>Anatomy</i> .....	£100	{ Prof. G. Viner Ellis, F.R.C.S. Vacant.
Two in <i>Physiology, Comparative Anatomy, and Zoology</i> .....	£150	{ Prof. Michael Foster, M.D., F.R.S. Vacant.
Two in <i>Obstetric Medicine</i> .....	£75	{ Robert Barnes, Esq., M.D. Prof. Graily Hewitt, M.D.
Two in <i>Materia Medica and Phar- macological Chemistry</i> .....	£75	{ T. R. Fraser, Esq., M.D. Vacant.
Two in <i>Forensic Medicine</i> .....	£50	{ Arthur Gamgee, Esq., M.D., F.R.S. Prof. Henry Maudsley, M.D.

The Examiners above named are re-eligible, and intend to offer themselves for re-election.

Candidates must send in their names to the Registrar, with any attestation of their qualifications they may think desirable, on or before Tuesday, March 25th. It is particularly desired by the Senate that no personal application of any kind be made to its individual Members.

Burlington Gardens,  
March 4th, 1873.

By order of the Senate,  
WILLIAM B. CARPENTER, M.D.  
Registrar.

## General Literature.

*Rousseau*. By John Morley. 2 vols. Chapman and Hall. 1873.

THIS is a much more serious attempt to meet a much more serious want than that to which the same author's companion volume on Voltaire was addressed. Voltaire's character can be understood without an interpreter: the story of his life has been told repeatedly; the substance of his most influential writings has passed long since into commonplace; the fascinating charm of his style may be acknowledged, but scarcely reproduced; and when all is said, we come back to the first and obvious conception of him as the brilliant embodiment of the wit and reason of an age that was sceptical *de gaieté de cœur*. With Rousseau the case is in every respect different. The influence, direct and indirect, of his writings is still being felt, while the writings themselves are so imperfectly known that its original source is often mistaken, and its future results miscalculated in consequence. His style, admirable as it is at its best, is weighted with matter harder to appreciate and easier to dislike than Voltaire's; and at the same time the most careful criticism of his works must be incomplete if it does not include an account of the incomprehensible personality that colours them so strongly; while such an account is scarcely to be met with in ordinary biographies, where the inner nature of the man himself is obscured to us by the mass of ancient scandal and modern controversy connected with nearly every act of his life. Mr. Morley has undertaken to make Rousseau better known on every side; as an original thinker, as a man of letters and genius, as a leader of thought—of thought promptly translated into action—and as a psychological problem; and as the task is proved to be possible, to candour and patience, its importance and use become increasingly apparent. With a wise discretion he declines to encumber the biographical portions with interminable attempts to reconcile the dates and other details given in the *Confessions*, with each other and with the statements of independent witnesses, or to determine precisely the rights and wrongs of Rousseau in each fresh quarrel with his friends. Accuracy on such points, even if it were attainable, would not substantially affect the general view of his character, for all his feuds were much alike in

origin, and their number makes it impossible to suppose him always the victim of injustice; while in other matters his own statement that he had once done or felt something could never be entirely unfounded, because living, as he did, in the impression of the moment, if he had not done or felt it at the time specified, it was yet as much a reality to him afterwards in imagination as it could be to saner men in memory. The only objection to this manner of treatment is that, while it preserves the general outlines faithfully, any particular inference suffers from the uncertainty of the fact on which it is based. Thus, for instance, Mr. Morley admits that Rousseau's residence at Les Charmettes may have lasted only a year and a half or a year, instead of four or five as he himself says, only adding that "a year may set a deep mark on a man." But it seems more plausible to suppose that Rousseau's character led him to dwell with disproportionate emphasis on an episode that was thoroughly congenial to his imagination, than that he should have been permanently influenced by a short and accidental relation which would only have been possible or significant to such a character as his.

In general we should say that Mr. Morley allows rather too much for the *milieu* and the effect of education and circumstance, and too little for that of native eccentricity of disposition and the congenital moral twist which, since it developed into actual insanity, we have neither motive nor reason for denying. Mr. Morley thinks this too easy an explanation of all that is abnormal in Rousseau's mental state, and is almost inclined to connect his mission as the champion of the condemned and oppressed with the existence of a sordid and contemptible side to his own character; but to remind us that the man whose flashes of divine inspiration set all Europe aflame was also the contented daily associate of Thérèse Le Vasseur, is just as likely to weaken our faith in the all-sufficiency of genius as to enlarge our charitable indulgence for the few common-place men who need as much as Rousseau. The bluntness of moral perception which made Rousseau indifferent to vulgarity in those nearest to him may help to account for what is worst in his writings, but has no necessary connection with what is good in his character. That there *was* good in his character Mr. Morley establishes by considerations which are both new and valuable. His happiest moments

were those passed in innocent idleness alone with nature or her uncivilized children; he had none of the vices that demand for their gratification the pre-existence of a complicated social organization; and it was this singularity—the fact that he did not want, and could not by any means learn how to occupy, a brilliant position in the society that he was to help subvert—that gave his paradoxes the earnestness and force of truth, and leaves a kernel of sincerity even to his affectation. His preference for homeliness and his power of frankly accepting life under quite irrational conditions, so long as the sensation of the moment was not irksome, were those of a child rather than a philosopher; but the vividness of his ideas stood, for himself and others, in the place of logic. As he could only think what he had previously felt, there was a strong element of arbitrariness, as M. Saint Marc Girardin pointed out, in the thoughts which proved so captivating to his contemporaries; but translated into theory, what was eccentric became original, and the fact that Rousseau could be content with a life like that of the people led to its being for the first time revealed to many that the people *had* a life, and that it was of some importance whether they were content with it or not. His morbid jealousy of patronage or dictation may be explained as the confused and querulous expression of just self-assertion; he says in the *Contrat Social*: “Toutes mes idées se tiennent, mais je ne saurais les exposer toutes à la fois,” and what is doubtful if asserted of his ideas is certainly true of his sentiments; the same instinctive misanthropy which made him an impossible friend and an execrable lover gave him a position outside the existing social order, from whence he could compass its destruction in the name of fraternal charity. If he had been less completely out of sympathy with the tastes and prejudices of the old world, even his potent imagination might have failed to contemplate such a complete reversal of them all as was realized, first in his writings, and then in the acts of his political disciples.

Still we cannot admit either that his genius partook of insanity or that the hallucinations which destroyed his private peace were merely the effects of ill-temper and bodily ill-health. Mr. Morley admits that in his quarrel with Hume the limits of sanity are clearly overpassed; but if it is madness to have the mind occupied in succession with contradictory impressions, some of which have no counterpart in reality, certainly Rousseau was not always sane during the latter part of his stay at the Hermitage. The patience of Saint Lambert, Madame d'Épinay, Grimm, and Didérot lasted longer than that of his English friends, because, knowing him better, they had had more practice in indulgence; but it was quite as severely tried. His only real grievance was that his friends, especially Didérot, insisted on knowing what was good for him better than he did himself, and sometimes conspired to benefit him after their own fashion instead of leaving him alone after his: Hume's first offence was of the same kind—having allowed Mr. Davenport to try and cheat his guest into paying less than its full cost for a post-chaise. In all practical matters Rousseau's intelligence was as weak as his impulses were strong, and if he felt himself hampered in the free development of the latter, he was never able to think of any other way of escape than by physically running away, or, if that was impossible, breaking out into impotent and venomous complaints. Mr. Morley is not one of Rousseau's apologists, but he points out both that the author of the *Discours sur l'Inégalité* had earned a right to live as he pleased, and that there was a certain fitness in his choosing to live by copying music. His comments on Rousseau's explanation of his own natural ingratitude suggest a general consideration that may help to extenuate the moral delinquencies of other

men of genius besides Rousseau. The emotions cannot be commanded at will, and when Rousseau was guilty of gross ingratitude to a former benefactor, the reason simply was that he no longer felt grateful; the benefit and the feeling it had excited at the time were past and gone, and his consciousness was filled with fresh and quite different impressions. If the claims of his own personality had been less exacting, he might have deferred so far to popular conceptions of what is becoming as to affect the virtues he had not got; but then he would not have been the Rousseau of the *Confessions*. Such peculiarities as his insensibility to past kindness are extremely unamiable, but from the moral point of view there is a distinction between blank incapacity to see a duty or to feel the justice of another person's claims, and conscious, voluntary disregard of them when recognized. Just as his resolve to be himself made him most conspicuously the man of his age, his vanity led him into candour which, in more ways than one, has had the effect of modesty: he not only makes the worst of his character by accepting and identifying himself with passing thoughts (such as his inheritance of Claude Anet's wardrobe) which, though they might occur to other men, would be thrown off at once as a vagary of physical association or suggestion not affecting the real self, but the very completeness of his absorption in the impression of the hour in its bearing on himself prevented his estimating the effects he was meanwhile producing upon others, and we should never have learnt from his writings, what is nevertheless a well-established fact, that, in his lucid intervals, people who did not send him game or prepay their letters found him an agreeable and amiable companion. Mr. Morley does not, of course, offer a cut and dried theory of so paradoxical a subject, but without omitting anything essential he has harmonized the incongruous features into as intelligible a portrait as fidelity to his perplexing original would allow.

With respect to the Discourses on the Influence of the Sciences, on Inequality, and the *Contrat Social*, the most useful thing to be done was to give an account of their substance, for they answer themselves to readers of the present day, while they have far too much historical importance to be neglected with impunity. Mr. Morley perhaps attaches too much weight to Rousseau's account of his studies at Les Charmettes and the singular plan on which he conducted his education, but taken merely as a statement that he was incapable of criticising the conclusions or reasoning from the data of other writers, it gives a true representation of his habits of thought both then and later. His reasoning consisted in a series of intuitions joined together with the sophistical ingenuity of passion, and no amount of instruction or method could have taught him to proceed differently. In judging his writings, therefore, the objective value of his conclusions is the only point to be considered, except so far as he is responsible for introducing the passion for neat paradox, in lieu of the neat truism of Voltairian philosophers, which has had so much influence on later French speculation. By confounding in his attacks on civilization the graces and the admitted defects of the existing social order, he struck the imagination, and even when his generalities were as unsound as those by which the *status quo* could be defended, they were not so easily refuted by an appeal to experience. Nothing can be easier than to show the historical unreality, or rather impossibility, of the “state of Nature” which he supposes, but the praise of such a state was the strongest blame of modern art and corruption, and if society has never been entirely self-satisfied since he wrote, his blunderingly consistent attacks on conventionality and luxury must have a large share of the credit. But in the *Contrat Social* he had got much further than this: we hear comparatively little of the

state of nature, and in fact Mr. Morley seems to do rather less than justice to his second thoughts by taking for granted that he supposed his imaginary contract to have been entered into by persons living in that imaginary state. In the later work he admits, with the instinct which so often makes him unconsciously profound, "*la famille est donc, si l'on veut, le premier modèle des sociétés politiques*"—a concession to history which neutralizes the effect of his introductory metaphysical flourish, "Man is born free, yet is everywhere in chains." Obviously it is not "Man," but babies that are born, who grow into men under conditions which do not, as a rule, fit them to claim at maturity the freedom which cannot be denied to those able to take it. But the significance of Rousseau's new gospel of the sovereignty of the people was independent of historical theories respecting the origin of political societies and the lawful basis of governments. It lay rather in his present and vivid belief that every state still was, actually and necessarily, an association of beings of the same kind, maintained with the consent, tacit or expressed, of all its members. Revolutionary democracy was implied in the conception of Louis XV., a duke, a philosopher, and a starving peasant as parties to the same act of acquiescence; but history promptly put the theorist in the right by proving that the peasant could break the compact when he chose as easily as the king. Mr. Morley criticises the destructive, anarchic tendencies of the doctrine, but the most stable governments are not those which are independent of the consent of the governed, for there are none such, but those in which the consent of the governed is most unreserved and unanimous. To secure the consent is a matter of art rather than science, and Rousseau has little that is valuable to say about the organization of society; but he was the first to penetrate below the surface of actual or possible social forms to the essential principle of association, and though the right of the strongest to rule had often been maintained before, he threw an entirely new light upon the question who was the strongest. He does not distinguish clearly between the sovereignty of the people and respect for individual freedom; but he at least sees farther into the matter than Voltaire, who thought only of the latter. Even in a passage—which Mr. Morley condemns as arithmetical quibbling—in praise of small states, he is only forestalling Mill and De Tocqueville on the tyranny of democracies, though he failed to allow for the influence of tradition in forbidding coercion, except by means of public opinion. It would perhaps have enlarged the scope of the work unduly, but we should have been glad if, after tracing Rousseau's obligations to Hobbes, Mr. Morley had devoted a chapter, instead of two or three pages, to indicating the extent of his influence on political speculation in England as compared with France, and the point at which the current diverged into the separate channels of political revolution and socialistic reconstruction.

A similar distinction must be drawn between the two lines or branches of his literary descendants. In the chapter on *La Nouvelle Héloïse* Mr. Morley accounts for the curious fact that Châteaubriand, Lamartine, and the royalist-religious reaction generally drew its inspiration from Rousseau by the presence of a constructive side in his revolutionary sentimentalism. It is true that he was moral compared with Crébillon and Didérot, pious compared with d'Holbach and Hébert; yet at the time of its appearance *La Nouvelle Héloïse*, in spite of its praise of the family and its pictures of pastoral felicity, was not considered an edifying work; like *Le Contrat Social*, it was too ingenious to be safe; and though Châteaubriand only borrowed its rhetorical fervour, and turned his sophistical skill into quite unexceptionable channels, the next generation relapsed into utter law-

lessness. Rousseau's *Héloïse* and *Emile* are a part of the history of Romanticism from its first outbursts after the restoration of the Bourbons to its latest English echoes. Of *Emile* there is not much that is new to be said. Mr. Morley "improves" the Savoyard Vicar in the interests of Positivism; but in this even more than in the other works the general principles and practical recommendations are of much less value than isolated remarks; and he might have given Rousseau credit for not a few phrases which, with a more consistent thinker, would be unmistakable indications of *positivité*. To those who know little or nothing of Rousseau at first hand, Mr. Morley's full and accurate account of the man and his writings will be invaluable. His most zealous admirers might perhaps object that his moments of profound insight and the beneficial effects of his influence are not rated at their highest value; but even they will be grateful for a candid and discriminating appreciation of an author who greatly needed an interpreter. EDITH SIMCOX.

Hilario Ascasubi. Obras completas.—Primer Volumen, Santos Vega, ó los Mellizos de la Flor, Rasgos Dramáticos de la Vida del Gaucho en las Campañas y praderas de la Republica Argentina (1778 a 1808). Segundo Volumen (de 1853 a 1865). Aniceto el Gallo, y otras Poesias Ineditas. Tercer Volumen (de 1839 a 1851). Paulino Lucero, ó los Gauchos del Rio de la Plata. Paris, in 8vo, 1872. Imprenta de Paul Dupont.

OF all the Argentine poets Don Hilario Ascasubi is certainly the most popular, and I may add the most worthy of being known. During the forty years and more that he has written, his reputation has grown and spread increasingly; his patriotic poems, *cañas, cielos*, are still as generally sung in Buenos-Ayres as at the time of their first appearance. The only edition in which they have been hitherto collected, and that in an incomplete manner,\* has long been exhausted, and I do not like to mention the exorbitant price I was obliged to give for a copy of it in Montevideo. The new one forms three volumes in 8vo, the first of which contains a long poem, *Santos Vega; or, The Twins of Flower-Farm*. The second is filled by the *Songs* published in 1853, and the third by several articles in prose and in verse selected from a satirical journal, *El Gallo* (The Cock), where they appeared about the years 1853-1858.

It is a common fault with most of the Spanish-American poets to want, I do not say political, but *poetical* nationality. But for the accident of their birth and the uses of geographical and botanical names such as *Uruguay, Buenos-Ayres, chirimoyo*, for *Tage, Cadiz*, and *jásmín*, they would be true Spanish writers, not American ones, so admirably do they contrive to forget the manners and the tongue of their country. With M. Ascasubi no one can complain of a want of originality. From the very first verse of his poems one feels transported in a world wholly *un-European*, but for all that entirely the reverse of conventional. It lives a life of its own, is moved and led by impulses and motives of its own, and even speaks a tongue of its own, that which we hear spoken not only by the Pampa farmers and *peons*, but also with more elegance and an attempt at classicism by the more refined denizens of Buenos-Ayres and Montevideo. There are some phonetical alterations in it, some substitutes of new meanings and new words for old meanings and old words, some highly flavoured idioms which are calculated to puzzle at first the reader not previously acquainted with them: so great indeed and so many are its peculiarities that the purists of modern Spain cry out at its barbarisms, unjustly as I think. This Argentine vernacular is a form of Spanish other than the Spanish of Spain, but as legitimately

\* Under the title of *Trovos de Paulino Lucero*. Buenos-Ayres, 1852. 2 vols. in 8vo.

drawn from the tongue of Ercilla and Cervantes as any dialect spoken nowadays from Algeiras to St. Sebastian. Only since the time it went out to America it had such new ideas to embody, such new sensations to express, such new aspects of scenery to describe, such new manners and customs to reflect, that it had to throw off many of its old habits and to develop itself into new shapes it would never have assumed in the mother country. Such as it is now, it has been made to smell so strongly of the soil upon which it grew as to recall instantly to the mind by the picturesqueness of the words the picturesqueness of scenes seen long ago and never to be forgotten by any one who has looked upon them.

Nowhere can this special form of Spanish be so perfectly studied as in M. Ascasubi's works. First as an officer in the navy, and later as officer in the army, M. Ascasubi from the time he was a lad of twelve or thirteen was brought into contact with the people whose language he writes and whose customs he pictures. He finally so identified himself with the Gauchos that he became himself a Gaucho. He it is who, under the names of Jacinto Amores, Ramon Contreras, Ruperto Flores, Paulino Lucero, narrates in the *Trovas* the various episodes of the great siege of Montevideo by Juan-Manuel Rosas and Oribe, celebrates the exploits of the *Orientales* chiefs, Rivera, Pacheco y Obes, Lavalle, even Garibaldi and his Italian guerrillas, then in the service of the Republic of Uruguay. He again it is who, under the name of Aniceto el Gallo, pursues with his sarcasms Don Justo Jose de Urquiza, Rosas' conqueror, and all the statesmen who in 1853 attempted to rob Buenos-Ayres of its title of capital of the Argentine Republic. He it was lastly who, assuming the name of *Santos Vega el Payador* (The Improvisatore), tells the adventures of the Twins of Flower-Farm, and describes the habits of the Gauchos.

It is especially in this last poem that one can admire the many and various talents which have won for the works of M. Ascasubi their well-merited popularity. This poem fills as many as five hundred pages, and contains at least ten thousand lines. Thus when I opened it it was with some feeling of hesitation; but after reading the first part I got so interested that I could not help reading the whole from end to end without interruption. It is the history of twins, one of whom becomes a rich farmer and the other a bandit, from their birth until the death of the bandit. Round these two main personages are admirably grouped the other numerous characters of the Argentine society of the last century: the titled colonist, who lives in his *hacienda* like a prince in the midst of his subjects, his wife, their son devoted to the Church from his childhood, all three full of *bonhomie*, and uniting to their manners of *grands seigneurs* and Spaniards a great benevolence and affection for all the people of their household, whatever they may be; the young girl of the Pampas Azucena and her Gaucho lover; an old judge crammed with Latin, and an old rogue of a *pulpero*; a European soldier, bragging and boorish; and lastly, as a contrast, a Gaucho of our own time and his wife, to whom old Santos Vega is supposed to tell of the Gauchos of the past. Each of these personages speaks the language suited to his character with so much spirit that often in reading their words I fancied I was listening again to fragments of conversation heard long since in the same country. Once Lafontaine was asked how he managed to attribute to the creature-heroes of his fables language so appropriated to the nature and habits of each. "Oh!" said the *bonhomme*, "I put myself into their skins, that is all." M. Ascasubi has found out how to put himself into the skins of his personages. Those who wish to obtain an idea of the rural life of Rio de la Plata without leaving their arm-chair have but to read Santos Vega: as they close the book they will

know it as it is, or rather as it was some thirty years ago. European immigration, the innovations of high roads and railways, and above all the long wars, both foreign and civil, which have passed over the country since the time when M. Ascasubi's heroes lived, have deeply altered the race and changed its customs. The Gauchos are disappearing as the trappers and Indians of Cooper have disappeared. Fifty years hence they will be a type entirely foreign to the country which still owns them at this moment, and Santos Vega appearing in the streets of Buenos-Ayres or Córdoba will produce the same effect as if Leatherstocking were to stalk through New York or Albany. Thus the work of M. Ascasubi, besides its poetic merit, is an historical document of the highest importance; it contains the picture of the manners of the heroic age, or that which an American writer ingeniously named *the homeric antecedents of the Argentine nation*. The historians of the future will find in his poems the portrait admirably drawn of an extinguished race, whose faults are often exaggerated, but whose noble and generous qualities cannot be too highly praised.

G. MASPERO.

### THE NUT-BROWN MAID.

To the Editor of the ACADEMY.

SIR,—I venture to trouble you with a suggestion as to the proper way of understanding some parts of the beautiful old ballad, "The Nut-brown Maid." The point is how the poem is to be distributed among the interlocutors, and whether the poet speaks in his own person. The date of the "Nut-brown Maid" is uncertain. In Prior (see below) it is titled "A Poem Written Three Hundred Years Since," i.e. in 1418. This is probably too early; but on the other hand the poem seems older than the oldest copies, and may have been corrupted by oral recital. It was first printed in *Arnold's Chronicle*, a book supposed to be of date about 1502. A MS. belonging to Balliol College contains *inter alia* a copy of the poem, at the end of which is added, 'Explicit, quod Richard Hille,' of about the same date, but not exhibiting so good a text. The text of the Balliol MS. will be found reprinted in Messrs. Hales and Furnivall's edition of Bishop Percy's Folio MS., vol. 3. Prior, in his poems, first published in 1718, prefixes to "Henry and Emma" a fairly good version of the ballad, minus the last stanza. According to Bishop Percy (*Reliques*, vol. ii.), Prior found this in the *Muses' Mercury* for June, 1707, where the poem was first revived, but which I have not seen. "Henry and Emma" is a half-story, half-dialogue, founded on the "Nut-brown Maid," of which it paraphrases parts. Regarded as an imitation of Dryden's Fables, it displays great rhetorical force and dexterity of verse; but Prior's couplets and triplets fall very frigid after the simple directness of the older poem. One line survives, a little altered, as a familiar quotation; "fine by degrees, and beautifully less:" which is said of a lady's waist. In Percy's Folio MS. a very incorrect copy appears. In Chalmers' Johnson's *Poets*, 1810, vol. x., among Prior's works the "Nut-brown Maid," with the last verse, is prefixed to "Henry and Emma." And lately Mr. Skeat has given the poem in his excellent *Specimens of English Poetry*, from Arnold's text, with variants, chiefly from the Balliol MS.

Now how have these various editors understood the twofold division of speakers? Arnold's is the best text. Where Hill varies from him, it is upon the whole for the worse. Percy's version is wretchedly debased. The copies included in Prior's works do not seem to have any independent tradition. Arnold's original edition I have not seen; but in Douce's reprint, which I presume to be made *litteratim*, the poem is given in eight-line stanzas, without farther divisions of any kind. The best text therefore leaves us to allot the parts at our discretion. The Balliol MS. marks the interlocution in the margin, beginning at st. 4, where he has "Puella," to whom "Squire" replies. St. 15, 17, 18, 23, 24, 26, 27, 30, have no mark of speaker. Apparently the writer considers that the first three stanzas and the last belong to the poet. But he may have written in these marginalia carelessly as he went along, considering the

want of uniformity with which they are employed. In Prior, ed. 1718, "Man" and "Woman" are distinguished, the man beginning at

"I am the knyght, I cum be nyght."

After this the verses are given to Man and Woman alternately, the man concluding with

"Thus have ye wone an Erle's Son, And not a banishyd man."

So that he seems to divide as Hill does. In Chalmers the stanzas are marked *ab initio* "A" and "B" alternately, which I conceive to be the right way. Mr. Skeat gives the introduction, *i.e.* all down to "I am the knyght," to the poet, and I presume the conclusion also.

But it seems to me that the proper way to understand the poem is this: that it is a dialogue *ab initio* between two persons, male and female, who plead the cause of their respective sexes. The speeches of either end all through with the words "banished man" and "alone," the rest of the lines being modified according to the context. The first speaker (the man) begins with the familiar complaint of the faithlessness of woman. In stanza 2 the woman allows this to be a common accusation, but pleads instances on the other side, and notably the "nut-brown maid" (as if this had been a well-known name from some previous ballad or the like):

"I say not nay, but that all day it is bothe writ and sayde  
That womans fayth, is as who saythe, all vtterly decayed;  
But neuertheless, right good wittes in this case might be layde  
That they loue trewe, and contynew; recorder the nutbrowne maide,  
Whiche from her loue, whan, her to proue, he cam to make his mone,  
Wolde not departe, for in her herte she loutyd but hym allone."\*

"I say not nay" is surely the answer of a second speaker, allowing that there is something in what has been said, though it can be refuted; and so below, in stanza 12, the Nut-brown maid assents to her lover's statement by saying—

"I thinke not nay, but as ye saye, it is noo maydens lore."

The first speaker then answers; very well; suppose we assume the persons of these two, the Nut-brown maid and her suitor, and speak for them:—

"Than betwene vs lete vs discusse, what was all the maner  
Be-twene them too; we wyl also telle all the peyne in-fere  
That she was in; now I begynne, soo that ye me answer.  
Wherfore alle ye, that present be, I pray you geue an care:—  
I am the knyght, I cum be nyght, as secreet as I can,  
Saying; 'Alas, thus stondyth the case, I am a bannished man.'"

To which the lady answers: "I accept the proposal, and will speak for the Nut-brown maid:—

"And I, your wylle for to fulfille, in this wyl not refuse,  
Trusting to shewe, in wordis fewe, that men haue an ille vse  
To ther owne shame, wymen to blame, and causeles them accuse;  
Therefore to you, I answer now, alle wymen to excuse:—  
'Myn owne hert dere, with you what chiere? I prey you telle anon,  
For in my mynde, of all mankynde, I loue but you allon.'"

After this the dialogue goes on regularly till the last stanza, 30, which is the speech of the female speaker after the conclusion of the imaginary dialogue:—

"Here may ye see that wymen be in loue meke, kinde, and stable,  
Late never man reproue them than, or calle them variable;  
But rather prey god that we may to them be comfortable,  
Which somtyme prouyth suche as he loueth, yf they be charitable;  
For sith men wolde that wymen sholde be meke to them echeon,  
Moche more ought they to god obey, and serve but hym allone."

The composer, therefore, never appears at all in his own person. There is but one difficulty on this hypothesis, and that is the words of the first line,

"Be it right or wrong, these men among, on women do complaine."

"These" men comes rather awkwardly from the mouth of one who is speaking for the male sex. As none of the texts are very much to be relied on, could we read "we" or "wee" men? The difference in

old writing would be little or nothing. Not impossible "these" might be the mistake of some one who conceived the poem to be a woman's work. Bishop Percy in a MS. note in his folio suggested this, and Mr. Skeat mentions it as not unlikely. But Percy's conjecture seems simply to rest on the very corrupt reading of the last stanza he found in his MS.; and I cannot say that I see any trace of a female hand in the poem, my supposition of a female interlocutor being once allowed. Would a woman author have made the heroine such a very pliable Griselda?

### THE GAELIC SOCIETY OF INVERNESS.

THERE has been started two years ago in the Highlands of Scotland a literary society whose exertions deserve to be noticed and encouraged, the "Comunn Gailic Inbhir-Nis." Although a *Commune* by its name, it has nothing in common with the Paris Commune, and it is of a merely literary and conservative character. The objects of the society are clearly exposed by their constitution: "The objects of the society are the perfecting of the members in the use of the Gaelic language; the cultivation of the language, poetry, and music of the Scottish Highlands; the rescuing from oblivion of Celtic poetry, traditions, legends, books, and manuscripts; the establishing in Inverness of a library, to consist of books and manuscripts, in whatever language, bearing upon the genius, the literature, the history, the antiquities, and the material interests of the Highlands and Highland people; the vindication of the rights and character of the Gaelic people; and, generally, the furtherance of their interests whether at home or abroad."

That is a wide and promising field, and it is very satisfactory to see the Gaels of Scotland take into their hands the cause of their too long neglected literature and history. It is true that the Gaelic language may die one day or other. In our modern Europe, where no nation can any more live isolated, it is the unavoidable fate of all nationalities which have no political existence and whose representatives do not number by millions. Yet it is the duty of those whom nature has made heirs to an ancient and glorious history, and who are the last offsprings of a noble race, to cling to what is their nearest fatherland. With that feeling of pious duty to the past the members of the Gaelic Society have gone to work. They hold meetings, where papers are read and lectures delivered, and the business is carried on in Gaelic every alternate night. They have also an annual meeting, when competitions for prizes take place in pipe and other Highland music, and in Gaelic poetry. Lastly, they publish transactions.

The first volume has just been published (*Transactions of the Gaelic Society of Inverness*. Vol. i. Year 1871-1872. Inverness: Printed for the Society by William Mackay. XV.—127 p. in 8.) It has for its motto the old saying: *Clann nuan Gaidheil ri gaillean a'cheile*, "Clan of the Gaels with shoulder to shoulder." It contains the constitution and the history of the society, the proceedings of the first annual assembly, papers and pieces of Gaelic poetry which have been read in the ordinary meetings. Some of the papers and addresses are in Gaelic. On p. 110 will be found a Gaelic translation of *God save the Queen* by the society's bard, Mr. Angus Macdonald, which was sung at the first annual meeting, and we willingly believe that "the surprise was pleasing and the effect grand." The chief papers are the following:—Local Topography, by Alexander Mackenzie; the Clan System, by John Murdoch; the Legends of Glen Urquhart, by William Mackay (in Gaelic); the Forty-Five, by Charles Mackay (in Gaelic); Survey of the Celtic Language, by the Rev. William Ross; the Highland Clearances, by John Macdonald; Notes on the History of the Gaels, by Lachlan Macbean; Nationality, by Professor Blackie. In perusing these papers we have been surprised to see how little known in the upper north are the works of the continental Celtic scholars. Zeuss' masterly work, the *Grammatica Celtica*, which is the very foundation-stone of all Celtic philological researches, is mentioned only by the Rev. William Ross, who pays a pious tribute to the father of Celtic philology. Mr. William Ross is well informed, and we are sorry to miss in his "survey" Chevalier Nigra's publications. But it would be unfair to criticise too severely the new-born and yet so promising society. We shall only ex-

\* The quotations are from Mr. Skeat's text, omitting the italics, etc., as beside the present purpose.

press the wish that in their future volumes more room should be given to original texts, *i.e.*, popular music as well as historical documents, collections of proverbs as well as unedited literary works, &c. We know it is one of the objects of the society; and we have their promise in the introduction: "The Highlands owe it to the world of letters and philosophy that whatever the Gaelic language, traditions, legends, poetry, sentiments, and philosophy contain which is of value should be preserved by those who know them, and handed over as valuable contributions to the stock of materials out of which human learning must be built up." H. GAIDOZ.

### Notes and Intelligence.

In reference to a statement in a recent number implying that Dr. Newman had for some time been editor of the liberal Catholic journal called the *Rambler*, which was started five-and-twenty years ago, the Rev. J. M. Capes writes to us that Dr. Newman never edited the *Rambler*, and though an occasional contributor to its pages, never identified himself with its opinions. Mr. Capes remained its editor and proprietor for several years, when he transferred it to Sir John (now Lord) Acton, by whom it was transformed into the *Home and Foreign Review*, which lived a few years, and was finally crushed by the condemnation of the English Roman Catholic prelates. The *Rambler* early found itself in antagonism with some of the Roman bishops, especially through its exposure of the defective condition of the education given in the Roman Catholic colleges. Its success, however, was considerable, until its increasing liberalism of tone and independence drew on it the open hostility of Cardinal Wiseman and other prelates who dreaded its influence upon clergy and laity alike.

The death of Doña Gertrudis Gomez de Avellaneda (b. 1816) was announced in February; she was favourably known in all Spanish-speaking countries as a poetess, and her plays, if not remarkable for originality, were uniformly successful on the stage.

A Swiss paper states that Professor Coindet has presented the public library of Geneva with a complete MS. of Rousseau's *Emile* with notes and corrections in the author's own hand, and one hundred original letters, also of Rousseau's, some of which have never been published. The MS. remains of A. W. Schlegel, which have been already utilized by historians of German literature, have been purchased by the Royal Library of Dresden. It is reported that a MS. of eighty-four pages, by Copernicus, has been discovered at Thorn.

The experiment tried some thirty years ago, under Tieck's direction, has just been repeated at Munich, where the Antigone of Sophokles, with Mendelssohn's music, has been produced at the *Hoftheater* with strict classical correctness and severity. The attendance at each performance was large, but it is said not enthusiastic.

The publication of *Neue Mittheilungen aus J. W. von Goethe's handschriftlichem Nachlass* is announced. It will include "Goethe's Scientific Correspondence," arranged by himself, and extending from the year 1812 to 1832, which will occupy two volumes; and "Goethe's Correspondence with the brothers Von Humboldt," in one volume. The letters exchanged between Goethe and Wilhelm v. Humboldt from 1795 to 1832 will form a series of the highest interest and importance.

In the *Revue des deux Mondes* (March 15) M. Alfred Rambaud gives some interesting information about the recent development of female education in Russia. Its extremely democratic character, and the eagerness with which women of all classes engage in teaching as a profession, are fresh points of resemblance between the Empire and the United States. The education given seems to be thorough as far as it goes, but we cannot tell to what extent the Russian lady who has just taken a doctor's degree at Leipzig University "cum laude" is a fair representative of the students at the public schools or gymnasia of the Princess Mary described in the article.

Amédée Thierry, the historian, died at Paris on the 27th ult.

The great Norwegian poet Ibsen, whose works are just now beginning to be known here, has finished a poem which promises to be very important—a trilogy on the history of Julian the Apostate. The subject is treated in a satirical and essentially modern manner.

### Art and Archaeology.

A Concise History of Painting. By Mrs. Charles Heaton. London: Bell and Daldy.

MRS. HEATON made her first appearance in literature with a biography of Dürer. She now makes her second with a concise history of painting. Between biography and history there is a great and important contrast, which becomes still more marked as the latter requires more conciseness. It is a question whether the skill of the biographer and the terseness of the historian can be found united in one person. Mrs. Heaton certainly is more concise in her matter than in her style; and it is probable that nature and education have fitted her better for biography than for history. Yet she brings to her task a large acquaintance with the general literature of art, a cultivated taste, and an amount of experience sufficient to enable her to colour in original tones many of the observations which she has to make upon the masters of the many schools to which her attention is directed. Her narrative power is of that lightness and delicacy which are peculiar to women; a flash of genuine enthusiasm embellishes some of her recitals; and the tale is frequently freshened by a playful undercurrent of humour.

The difficulty of combining conciseness with the usual qualities demanded of an historian are extreme. Mrs. Heaton's treatment in this respect gives us cause to inquire whether art history can bear the sort of conciseness which she affects. The general reader may not have reason to complain; but the student will ask how it is that whilst we trace the broad stream of art in every country, the tributaries are invariably left out. The early periods of local schools in Italy are omitted everywhere but at Florence. There is no Paduan or Veronese painting before Mantegna; and we miss the remarkable revival of Altichiero, Avanzi, and Vittore Pisano. At Milan, Foppa, Suardi, Buttinoni, and Zenale are ignored in the earlier, Borgognone in the later, period; and Luini or Beltraccio are presented to us merely as pupils of Da Vinci. The Bolognese and Ferrarese are not considered worthy of study till the time of Francia and Gaudenzio. Perugia yields nothing of interest till Perugino comes. Local craftsmen are of no account in Friuli or Piedmont, at Genoa or Pisa, at Arezzo, Parma, Cremona, Pavia, Bergamo, Lodi, Treviso, or Vicenza. The narrative probably gains in general picturesqueness in proportion as the minor details are concealed; but the value of the work to a certain class of readers is in a similar proportion diminished.

Mrs. Heaton has thought it worth while to revive the spectre of Byzantinism, which haunted the pages of history so unnecessarily and so long. It is a pity that she should have done so, for it is not true, though it has been held, that Byzantine art "took the place of the feeble classico-Christian, and is found triumphant in the later works of the catacombs." There is no sufficient foundation for the broad assertion that "all the artists of the eighth century were monks;" and surely it is an error of magnitude to affirm that "Leonardo's divine face of Christ is but the perfect development of the type founded at Byzantium." There are abundant materials at our command to prove that Byzantium was frequently indebted to Italy for artists; and it is possible at

different periods to discern the difference between the form and execution of the Levantines and those which distinguished the genuine Italian.

When painting first revived some portion of its progress was due to the earlier efforts of sculptors; and here a prominent place is justly assigned to Niccola Pisano, who worked with so much efficacy for "the rise" in the thirteenth century. A hundred years later Uccelli, Masolino, and Masaccio owed a great deal more than has been usually conceded to Ghiberti, Donatello, and Brunelleschi; but here Ghiberti, and Ghiberti alone, is considered "the herald of progress," whilst little or nothing is said of Donatello, whose example led to a revolution at Venice, produced Michael Angelo at Florence and ushered in Mantegna at Padua.

Amongst the names which it would be vain to seek in the pages of this history are those of Baldovinetti and Pesellino. Others of equal note are introduced by mere accident into the narrative—that of Castagno in connection with the fable of Domenico Veneziano's murder, that of Piero della Francesca in conjunction with Uccelli's as a master of perspective. All and each of these artists might have been named as party to the reform of the tempera method in Tuscany, and it was incumbent on the historian to show how oil painting was carried to perfection by the joint efforts of these men, whilst it was only introduced into Venice forty years or more after the death of John van Eyck by Antonello da Messina. If there be a bald spot in the "concise history" it is that which treats of the invention of oil medium by the Van Eycks; and if injustice is done anywhere in those pages, it is more particularly so where the author treats of Antonello, who has the misfortune to lie under her displeasure almost as strongly as the "angelic" Fra Giovanni da Fiesole. Here and there we may notice a casual blemish, such as that at page 118, where Costa is made to appear as the pupil instead of as the master of Francia; or at page 129, where Titian's "Diana and Calisto" at Bridgewater House is described as a copy of the original at Madrid; whereas the canvas at Madrid is a copy of that of Bridgewater House. Other mistakes must be assigned to the difficulty which any person writing in England encounters in the endeavour to become acquainted with the latest sources. There is a torpor with us in this respect which is not paralleled in any country in this hemisphere; and it is probably due to the difficulty of looking abroad for such things that Mrs. Heaton has failed to ascertain the following facts:—

Niccola Pisano was born in 1268, and not in 1280.

The earliest Florentine painter of note is not Tafi, but Margaritone, whose span of life extended not, as Mrs. Heaton believes, from 1236 to 1313, but from 1216 to 1293. Tafi, whom she supposes to have been born at the beginning of the thirteenth century, was still alive and in practice in 1320.

Gaddo Gaddi, according to her chronology, came into the world in 1239 and left it in 1312; the real dates of these events are 1259 and 1332.

It has never been denied that Guido of Sienna painted the Madonna of St. Domenico; but it has been proved that the principal figures were re-painted by a later artist, and it has been shown that the date of 1221 cannot be maintained, and must give place to one much nearer the close of the thirteenth century.

The poetic anecdote of Cimabue's meeting with Giotto by the roadside is to be consigned to the same limbo as that of Romulus, Remus, and the she-wolf. The anonymous commentator of Dante tells us how Giotto's father apprenticed his son to a woolstapler at Florence; how Giotto, like many other boys of his age and time, played truant, and how when looked for he was found in Cimabue's shop.

It was not Boniface VIII. but Benedict XII. who sent

a courtier to Giotto to ascertain his skill; and the result was an invitation to Giotto to visit Avignon, which he would have done but for Benedict's sudden death.

Masolino, who lived much longer than any one hitherto has supposed, was still in existence in 1447. Masaccio's birthday was December 21, 1401. Gozzoli's death is no longer uncertain; it occurred in 1498. Botticelli was not born in 1437, nor did he die in 1515; the dates are respectively 1447, and May 17, 1510. Antonio Pollaiuolo's birth was registered in 1429, not in 1430; Pier di Cosimo's in 1462.

There is nothing more touching than the account given in contemporary registers of the death of Domenico Ghirlandaio. He was seized with an attack of the plague on the 7th of January, 1494, which carried him off in four days: and such was the fear of infection prevalent at the time that the painter's body was consigned at midnight to the brotherhood of St. Paul, to which he belonged, and was secretly buried in the dark in the family vault at Santa Maria Novella.

Lucretia Buti, the nun and mistress of Fra Filippo, is a myth; but Fra Filippo did clandestinely obtain the affections of Spinetta Buti, a school pupil in a convent at Prato, and by her he had Filippino Lippi in 1457. On the 18th of April, 1504, Filippino died, and the pious registrar of S. Michele Visdomini, at Florence, added to the entry of his death, "Idio gli perdoni."

If we leave the Italian schools for the sake of turning to the more grammatic ones of the Netherlands, we find but little alteration in Mrs. Heaton's treatment. The statement that blood-streaming crucifixions and disgusting martyrdoms were favourite subjects at an early period in Flanders requires to be confirmed by some authority. That Flanders and Germany had an art of their own from a period coeval with the reign of Charlemagne is known; but this apparently does not interest our author, whose slight allusion to Broederlam is insufficient to give even a clue to the activity of artists in the fourteenth century. Some very old errors are repeated, such as that Hubert van Eyck was affiliated to the guild of St. Luke at Ghent in 1412; that John of Liège recommended John van Eyck on his deathbed to Philip of Burgundy; that John van Eyck exhibited a head of Christ at Antwerp in 1420, and took Roger van der Weyden as his apprentice. Not a word is said of Roger's birth and education at Tournai, not a syllable of Gerard David's existence; Memling's life is sketched without an allusion to the altar-piece of Danzig; and the claims of Justus of Ghent to a high place amongst the Flemings who wandered to Italy are ignored.

The Holbein question is treated without reference to the changes produced by criticism within the last few years. It may be that there is ground for assigning to Sigmund Holbein the portrait of the National Gallery, though it would be desirable that these grounds should be stated. It is still competent to a critic to hold, as Mrs. Heaton holds, that the Darmstadt and Dresden Madonnas are by one hand, though it may be safe to predict that the existence of such a critic will soon be as rare as that of the dodo. It is no longer possible for any historian to speak of pictures of 1512 as being by the younger Holbein, all such pictures being now fully proved to have been executed by the younger Holbein's father.

J. A. CROWE.

#### ART NOTES.

Herman Grimm has recently published a short pamphlet entitled "Zur abwehr gegen Herrn Professor Dr. A. Springer's Raphaelstudien in der Zeitschrift für bildende Kunst; Heft 3." In reviewing Herman Grimm's recent work, "Das Leben Raphaels von Urbino," Professor Springer (see *Academy*, Vol. iii., p. 445) took occasion not only to criticize severely the work

itself, but to make what looks like a personal attack upon the author couched in somewhat unmeasured terms. Professor Springer's position is so prominent and his credit so considerable that Dr. Grimm has felt obliged to take special notice of the attack made upon him. In the above mentioned pamphlet he meets one by one to the number of fifteen all the positive accusations of negligence and inaccuracy which have been brought against him by his critic. What appears to us to be the worst feature of the case is that while Professor Springer has fastened with tenacity on what may be described in the main as slips of the pen and oversights, he has preferred to let alone the really considerable points at issue, which have been carefully noted by Mr. Crowe (see *Academy*, No. 61, pp. 445-46).

The event of the season in the London auction marts has been the sale of three Sèvres china flower-pots of the kind known as *Eventail Jardinières* from the collection of the late Marquis of Londonderry. These ugly fan-shaped jardinières, with paintings by Dobson that marred instead of enhanced the beauty of the delicate blue and white Sèvres, positively fetched the fabulous sum of £4,150. Indeed it was said that they had been bought in for that price by the family of the late Marquis, who had expected them to realize a still larger sum.

The *Journal officiel* informs us that there is carried on in Paris an industrial art of the existence of which most persons are ignorant. This art consists in the restoration of old books and manuscripts, and has been raised by a few experts to a marvellous perfection. These *artistes restaurateurs des livres* cure all the ills that books are heir to. They take out the most inveterate marks and stains; they stop up holes gnawed by rats or eaten by worms; they replace missing lines and leaves in such a way that no one can discover the interpolations; they re-make margins, giving them exactly the colour of the original; in fact, the *Journal* says that often the most learned bibliophiles cannot tell the "restored" copy from the perfect original work. Ornamental frontispiece, editors' marks, vignettes, coats of arms, manuscript or printed pages, all are imitated to a perfection that deceives even the most practised eye. Such restoration is of course expensive. At a sale of books some time ago a tattered, filthy, "almost repulsive" but also "almost unique" copy of the Breviary of Geneva only fetched 500 frs. on account of the horrid condition it was in. The purchaser at once took it to a book restorer, who demanded 500 frs., the sum for which it had been bought, to restore it to youth and beauty. The process he said would take a year.

Naples, so notorious in the seventeenth century for the vindictive jealousy of her artists, has just celebrated the second centenary of the death of Salvatore Rosa, all the artists in the city taking part in a solemn ceremony instituted in honour of the greatest of the Neapolitan masters in the Church of *Santa Maria degli Angeli*, where he lies buried. The difference of manners of the seventeenth and nineteenth centuries is illustrated by the fact that no one was stabbed or poisoned on this occasion.

## Theology.

**Comparative History of the Egyptian and Mesopotamian Religions.** (Vergelijkende Geschiedenis von de Egyptische en Mesopotamische Godsdiensten. Door C. P. Tiele.) Amsterdam: Van Kampen. 1872.

THIS is the first volume of what promises to be an excellent and useful work. Dr. Tiele has been, as is well known to those familiar with recent Dutch thought, a diligent student of the science of religion, and he here gives us the results of his researches in one section of the extensive field he cultivates. The work is distinguished throughout by analytic and graphic power, is well written, always clear and intelligible, often subtle and suggestive in thought, acute and incisive in criticism, though it now and then offends by far-fetched interpretations and arbitrary combinations. The mental atmosphere of Holland seems to be meanwhile in some respects propitious to such studies as those of Dr. Tiele. The sacred criticism, literary and historical, there cultivated is of the freest kind. The philosophy which the eloquence of Opzoomer has commended to Dutch theologians is peculiarly well adapted to the explanation of the psychological phenomena the historian of religion has to study. The public taste, too, seems to relish such studies, as a series of works on the principal religions, creditable alike to Dutch scholarship and enterprise, has been issued; while eminent specialists like Kuenen, Dozy, and Kern are well known outside Holland for their studies in the religions of Israel, Islam, and Buddha respectively. Though the work of Tiele cannot claim the merit of strictly original research, it yet exhibits everywhere a vigorous and disciplined mind working in the successive religious strata under the best guides.

The work when completed is intended to be a Comparative History of Ancient Religions. These are distinguished from the modern by the characteristic of nationality. All religions which are those of a people or race are ancient, even though they still survive; only those like Christianity or Buddhism, which aim at universality, are modern. The work, which is thus comprehensive enough in its scope, suffers somewhat from the mode of issue. This first volume is in three parts, which have appeared at different times. This has caused the author now and then to repeat himself, as in some of the preliminary discussions on race and mythology, and also allowed time for changes in what may be termed his underlying philosophy, leading, in one case at least—his explanation of the origin of Egyptian animal worship (cf. pp. 128, 807-8)—to a modification of view affecting the entire religion.

The Egyptian and Mesopotamian religions here dealt with have two things in common—they are theocratic and symbolical. By the one their mythologies, by the other their forms of worship, are determined. The influence of race, traditions, migrations, country, history—on religion are recognized, and each made to explain the growth and changes in the national faith and worship. The Egyptian and Mesopotamian races are possibly akin. The Mesopotamian is the so-called Semitic. The limits of this paper compel me to pass over the interesting histories of the religions of Egypt, Babel-Assur, and Phœnicia, and to confine myself to that of Israel.

Dr. Tiele's general conception of the religion of Israel is sufficiently indicated by the place he gives it in his *Comparative History*. It is simply an ancient religion which does not differ even upon its highest standpoint in nature and character from the religions of the surrounding and related peoples. The only distinction is in their very different developments. (Cf. pp. 526, 791.) But in this view he obviously forgets that evolution is creative, and a difference

in development soon amounts to a difference in species. Whatever the religion of Israel was at its origin, it became under the prophets specifically distinct from the other religions of the Mesopotamian stock.

Dr. Tiele's position agrees in the main with Kuenen's. There are, indeed, specific differences. The one brings to his task the habits of an accurate Biblical scholar, gifted with a rare faculty for minute criticism, subtle insight into textual and historical differences, and extraordinary powers of combining apparently unconnected incidents and allusions. The other has the tendencies and learning of a comparative theologian, alive to the similarities and coincidences in the several religions he studies, but more or less dependent for his knowledge of each on eminent specialists. And as the men differ so do their works. But under the differences lie the agreements which indicate Kuenen's as the influence that has chiefly determined Tiele's representation of the religion of Israel.

He holds that "the books of the Old Testament are the sources of a religion which arose first in the ninth century before our era;" that it was "never the religion of the people of Israel, but only that of a very developed section of the nation;" that "the so-called Jewish nation which formed itself after the Captivity is not the people of Israel, but the Mosaic Church, which attempted to realize her theocratic ideal." Hence the question is not—"How a people not more religious than its neighbours and kin can profess a religion so much purer than these, for as a people it has never done this: the question is, How from one of the religious services (Godsvereeringen) of Israel a higher religious view can have developed itself, and how the defenders of this view have managed to secure its supremacy and permanent acceptance with many." (pp. 527-8). In working out this thesis Dr. Tiele starts with the Hebrews in Goshen, who, he argues, were neither monotheists nor worshippers of Jahveh. Then he describes the original Jahvism, which, he affirms, was a Kenite religion introduced to Israel in the wilderness by Moses. He next traces in succession the breakdown of the Jahvism, adapted only to the rude tribes of the wilderness, in Canaan under the Judges; its revival under Gideon; the impetus it received under Samuel and the Prophetic Schools; its condition under David and Solomon, neither of whom were monotheists; its struggle for supremacy in Israel under Elijah and Elisha; the rise under Amos and Hosea of a new type of prophet and a more ideal doctrine; the temporary realization of the prophetic ideal under Josiah. When the Deuteronomic Law is composed Jahveh becomes Israel's one God, who may be served only by Levites and at no other place than Jerusalem. But the ideal is soon broken, idolatry returns, and with it comes the sombre prophet, Jeremiah (the sketch of whom, by the way, is the best thing Dr. Tiele has written), and the Captivity. Here the history rather abruptly ends with the intimation that "the Captivity, the formation of the priest-state under Ezra, and the emergence of Christianity belong to the development of the Jewish religion" (p. 775). It is all the more to be regretted that Dr. Tiele ends where he does, as his earlier studies peculiarly qualified him to trace the influence of Persian on Jewish religious thought, and the post-exile period not only offers many crucial points to his construction of Israelitish history, but is specially significant to a comparative theologian as marking the transition from an ancient to a modern religion.

There are many points in a work covering so much and such well-debated ground that invite criticism. Only one or two can be noticed. Dr. Tiele accepts Kuenen's hypothesis as to the relative ages of the Jahvistic and Elohist documents. He does so almost without discussion, unhappily, consider-

ing the state of the question and the religious as well as critical interests involved. But having accepted Kuenen's hypothesis—which has many things to commend it, and is meeting, though not in the precise form or with all the issues Kuenen binds up with it, with large acceptance from the younger scholars of Germany—Tiele does not seem to me any more than its author to seize its proper psychological meaning. If the Jahvistic is the earlier and prophetic, the Elohist the later and Levitical, document, brought down with the Levitical legislation as a whole to the post-exile period, then we have the ideal or spiritual side of the Israelitish religion developed before the sacerdotal. But this would involve higher and milder elements both in the primitive and later Jahvism than Tiele attributes to it. If the prophetic was prior to the priestly ideal, the spiritual an earlier as well as nobler and more extensive growth than the sacerdotal, then it is evident that the character of Jahveh must have been comparatively mild, not much in need of propitiation by sacrifice. And this may help to explain, too, the number and character of the Jahvistic Psalms, and to show how hymns with so little sacerdotalism in them could be written and sung in Israel. But it also shows that the want of any adequate notice of literary remains so religiously significant as the Psalms is peculiarly great in a history whose author holds the priority of the Jahvistic document.

Dr. Tiele's interpretation of the patriarchal traditions do not seem very satisfactory. He resolves them into nature-myths. Abraham is a heaven-god and his wife the queen of heaven. Their relation to Isaac is thus defined:—"The old heaven-god, the midnight heaven, and the moon-goddess are the parents of the laughing day-heaven, or sun-god, who is married to the fatness or fruitfulness of earth, Rebecca" (p. 434). Jacob-Israel is explained as a personification of the people, though originally a god of the year, by virtue, I suppose, of his twelve sons. But this is simply gratuitous conjecture, explains nothing, and does not in any way fit into the narratives. Indeed I regret exceedingly the manner in which Dr. Tiele has dealt with the traditions of the Mesopotamian race, especially when Israel is concerned. He has given here and there indications of what he could have done had not his conception of its later history stood in his way.

The only other point that need be here noticed is Dr. Tiele's theory as to the original Jahvism and its introduction into Israel. He holds that Jahveh was originally a nature-god with his abode in heaven, the god of thunder. And he supports his views by various Mesopotamian and Indo-European analogies by the the symbols, the ark, and the kerubim used in the worship of Jahveh, and by the so-called feast of the Tabernacles, the oldest and for long only general feast of the Israelites, which fell in harvest, when the thunder-and-rain god was mightiest (pp. 545-551). But it seems strange that there should be no hint of this original character in the name of the god, Tiele's interpretation being accommodated not to the (supposed) etymology of the word, but to his own theory. His explanation, however, of the introduction of Jahvism into Israel is much more violent. He holds that Jahveh was originally neither an Israelitish, nor Egyptian, nor Canaanite, but a Kenite god, adopted by the Israelites in the wilderness through the influence of Moses. Now this is not only conjectural, but improbable in the highest degree. Of the Kenites we know little, not enough certainly to warrant what is here said of them. Then the Israelites had already strong religious convictions. Dr. Tiele attributes the Exodus to a religious cause (p. 536). Now it does seem illogical to make the nation which left Goshen rather than allow its worship to be reformed and the Egyptian ritual established in its place, accept so soon after,

without any struggle, an entirely new and stern religion. This is the more extraordinary as he repeatedly argues from religious names and traditions that Israel belongs to the Mesopotamian race, and affirms that the name of "the god of spirit and life in Babylon, Hu, Ao, Hea, or Iva is without doubt related to that of Jahveh" (p. 548). Certainly on this ground the inference lay near enough that Israel as a branch of the Mesopotamian stock did not need to borrow, because it had brought from its primitive home the name of its god.

Though thus differing on these and other points from Dr. Tiele, I have found his work interesting and suggestive. In the other sections of his work there is much less ground for difference; and more for commendation. The work in which he is engaged is one of peculiar value to the science of religion. It is with pleasure that I notice his transference from a pastoral charge at Rotterdam to the Remonstrant Seminary at Leyden. He is while superintending that seminary to lecture to the students of the university on the subject he has made so thoroughly his own. His inaugural lecture delivered in the great hall of the university has just come to hand. It is an eloquent argument in vindication of the right of the religion of savage races to be counted the starting-point of religious history. If the place where it was delivered was significant as to the changed relations of old theological enemies, the lecture itself is as significant as to the freedom and fearlessness of religious thought in Holland.

A. M. FAIRBAIRN.

Life and Letters of St. Francis Xavier. Rev. H. R. Coleridge, S.J. Vol. ii. Burns, Oates & Co.

THE second volume of Father Coleridge's work is hardly equal in interest to the first. The letters are so much the most authentic documents which we have that it was natural to give them with scarcely an exception at full, and this involved curtailing everything else, and even omitting some things, like Joam Fernandez' letters on the objections of the Bonzes of Japan, which might have had even a higher interest. The letters themselves are certainly characteristic, but it is inevitable that they should be full of repetitions; the same directions to India, the same requests to Europe occur again and again: and there are letters in which the same doubtful signs of promise are repeated without qualification, for in most of his own letters to Europe the saint observed the rule he recommended to his disciples, and confined himself to what could be published as edifying.

One can trace a certain change in the writer's point of view in this volume compared with the first. For instance, the directions to Mancias turn principally upon fervour; the directions to his later colleagues turn upon humility and tact. These last, in a good sense, are decidedly Jesuitical; perhaps he would hardly have allowed one of his subjects to copy his example, and to try to reward a lady for her attachment to the Society by marrying her daughter somewhat above her station. In the letters to Europe, where he had begun by demanding simply men of approved self-devotion, no matter how uncultivated, to baptize and catechize, we find him first demanding preachers for the different Portuguese stations, then dialecticians from Belgium and Germany to face the climate and convert the universities of Japan, and insisting more and more on the need of interior perfection in the missionaries to be sent, and hinting more and more plainly at the difficulty of maintaining the spirit of the Society under such a total change of conditions; at least this is how it is natural to interpret the reiterated requests that Ignatius will send some one intimate with himself and penetrated with his spirit, even though he should have no

other special qualification, to take up the reins of government at Goa.

Perhaps of the other points in the book the two following are the most noticeable. St. Francis was evidently struck by the great poverty of Japan and by its anarchy, where recent travellers are struck by its elegance and order. His twelve years' experience in the East had not the slightest tendency to incline him to give up hopes of doing what the great mediæval missionaries had done, and converting whole nations from above, and fall back upon the primitive system of converting populations from below.

G. A. SIMCOX.

#### THE EPISTLE TO DIOGNETUS.

To the Editor of the ACADEMY.

SIR,—In my notice of Overbeck in the *Academy* of January 15 (vol. iv., pp. 27, seq.), I may have seemed to imply in too unqualified a manner that Dr. Overbeck was alone in maintaining the late origin of the Epistle to Diognetus. It is but just, however, to our native scholarship to say that while Overbeck has elaborated the subject with greater fulness, he has been anticipated on the main point, as well as in several of his arguments, by Dr. J. Donaldson in his *History of Christian Literature and Doctrine*, vol. ii., pp. 126-142. Dr. Donaldson, indeed, even goes so far as to hint a suspicion that the Epistle may be the forgery of Henry Stephens himself.

Edinburgh, Feb. 3, 1873.

ROBERT B. DRUMMOND.

#### Intelligence.

The works of S. Isaac, of Antioch, one of the most eminent Syrian theologians after S. Ephraim, are in course of publication by Prof. Bickell, a distinguished "convertite" and Semitic scholar. The first part is reviewed by Prof. Nöldeke in the *Centralblatt* for February 22nd. S. Isaac appears as a strict censor not only of heresy, but of morals. Their rapid conversion to Christianity failed to extinguish the attachment of the Syrians to the ceremonies of their ancient cults. Thus the Christian women of Antioch are described as sacrificing in secret on the housetops to Venus (Kaukabhthâ, "the star"). A most unflattering picture is given of the life of the Oriental monks and clerics.

M. Douen has published some researches on the conduct of Fénelon during the persecutions of the Huguenots, which deal a severe blow to that eminent prelate's reputation for tolerance and humanity. See *L'intolérance de Fénelon. Études historiques d'après des documents pour la plupart inédits* par O. Douen, Paris, 1872.

A French translation of Prof. Nöldeke's popular essay on *The Old Testament Literature*, (see *Academy*, vol. i., p. 69) is about to be published by MM. Derenbourg and Soury.

In the fourth of a series of letters in the *Guardian* on "Manuscript Evangelia in Foreign Libraries," Mr. Burgon calls attention to a fragment of an old Latin version of St. John's Gospel, published under the title *Un Antiquissimo Codice Biblico Latino Purpureo conservato nella Chiesa di Saresano, del Sacerdote Guerrino Anelli*. (Milano. 1872.) It is said to be of the sixth or seventh century, and is inscribed in silver uncials on purple vellum. Mr. Burgon states that it is a fragment of a hitherto unknown recension of the old Latin.

The Rev. T. K. Cheyne, Fellow of Balliol College, Oxford, has in preparation a commentary on the Book of Genesis, somewhat in the style of Tuch's well-known work, but with a more distinct reference to the comparative study of myths and legends, and the elimination of their religious and historical elements.

The Bishop of Natal has another book in the press, a volume of popular "Lectures on the Pentateuch and the Moabite Stone," with appendices containing: 1. The Elohist Narrative; 2. The Original Story of the Exodus; 3. The Pre-Christian Cross.

Dr. H. Grätz has published a valuable dissertation on *The unity of the prophecy of Joel and the artistic division of its parts* (Breslau: Skutsch). He takes the imperatives in i. 13, 14, ii. 1, 15-17, to be rhetorical; the locusts to be actual, not metaphorical; and the prophecy itself to begin at ii. 19, the preceding portion of the book being merely episodic, as is frequently the case elsewhere in the Bible, e.g. in Jer. xiv., xv. The book was therefore written at one time: it falls into two parts, the former of which is the prelude to the latter. Joel first speaks ironically on the merely formal manner in which the fast-day or fast-days had been kept, and then describes in vivid colours the calamities which had occasioned them, which prefigured the still greater future calamities gathered up under the name of "the day of the Lord."

## Contents of the Journals.

**Theologische Tijdschrift.** March.—Strauss' *The Old and the New Testament*; rev. by Rauwenhoff, part ii. [Misses the scientific tone, and questions the validity of the arguments. The success of the work another symptom of the decay of idealism.]—Contributions to the criticism of the Synoptic Gospels, part vi.; by A. D. Loman. [The artificial arrangement and purposeful character of the parables in Matthew, especially in Matt. xiii. A colossal specimen of ingenuity.]—The superscriptions of the Gospels; by J. T. Bergman. Two works on the Fourth Gospel; rev. by A. D. Loman. [A notice of Mr. Sanday's recent essay (objecting strongly to his "psychological" method), and Dr. Vigilius' Inquiry as to the writer of John xxi.]—Literary summary. [Volck on Deut. xxxiii., Chwolson's *The Semitic Peoples*, Govet's *Etudes Bibliques*, &c.]—Emendation of the text of Origen in Matt., xv., p. 671; by Loman. ## Philosophy and Physical Science.

**The Principles of Psychology.** By Herbert Spencer. (2nd Edition.) 2 vols. Williams and Norgate.

ALTHOUGH psychology occupies the place of a special science in the system of knowledge which Mr. Spencer is engaged in developing, yet his exposition of its principles has necessarily involved a re-arguing of certain fundamental philosophical questions which have been previously discussed in his "First Principles." Indeed such argument seems to constitute the most important part of the new matter that has been added in this second edition of the work before us. For though the study of the human mind is not in itself philosophy, as certain Englishmen and Scotchmen seem to imagine, it is at least a sort of vestibule to philosophy, from which one passes directly to the *locus principiorum*. It is impossible to treat of mind (however phenomenalist be the manner of the treatment) without defining the relation of mental to material phenomena, or we may say of mind to matter, in so far at least as they are objects of thought. *Prima facie*, this relation is twofold: matter is both cause and object of mind. Thinking is a function of the brain, whatever else it may be, and what we think about is chiefly the external world. But the complete determination of this relation in its two aspects is the central problem, not perhaps of all philosophy, but of modern European philosophy since Descartes. I do not mean that this is what philosophers have been most deeply concerned to discover; that must be stated more generally as the relation of the thinker to the universe; but they have expected to find by the solution of the former question the data for answering the latter. And the success of Mr. Spencer's exposition, considered as systematic, must be held to depend on his success in answering this question; for his treatise, however valuable and interesting be the varied discussion that it contains, is certainly not an exposition of psychology, as the subject is commonly understood—what Mr. Spencer calls subjective psychology. It consists of eight books, of which the first contains chiefly human physiology, the third chiefly comparative physiology or biology (treated from an original and interesting point of view), the fifth a mixture of hypothetical physics with that hypothetical-deductive biology which is now common among disciples of Darwin; the sixth is to a great extent logical, the seventh avowedly metaphysical, while the eighth forms a transition to the sociology which is to follow. The subjective psychology is therefore given us in a somewhat fragmentary state. This is perhaps partly due to the manner in which the book has been composed. To half re-write a work written fifteen years ago is a difficult task, and I scarcely think that Mr. Spencer has been quite successful in performing it. He has transposed the two halves of the original treatise, in which Analysis preceded Synthesis; and

this is no doubt the most natural order of treating the subject as a sequel to the previously issued *Principles of Biology*. But the result involves two disadvantages: (1) the results of Analysis (of perception of space and primary qualities of matter in particular) are to some extent assumed in the Synthesis; and (2) Mr. Spencer has been obliged to prefix to the Synthesis (in Part ii.) an account of the elements and laws of mind which is not completely intelligible without the Analysis, and which after all does not cohere very well with the other parts that follow, as (*e.g.*) the view of the laws of association given in Part ii. is not traceable in Part iv.

However, it is difficult to criticize the arrangement of the work without some pre-judgment of the points discussed in it. For in fact the very definition of psychology and determination of its relation to other sciences (and this latter is a point which Mr. Spencer is especially concerned to settle) cannot be given without in some way deciding what has been called the central problem of philosophy. Before we can study mind we must settle what mind is: yet we ought not to settle it without giving some reasons for our decision: and yet every writer of originality feels that he cannot adequately give such reasons till after a careful exposition of his peculiar doctrines. All, therefore, that we can expect is that a writer's definition of his subject shall be clear and distinct in itself, and shall be found to cohere with his conclusions when we have been led up to these.

But, tried by this standard, Mr. Spencer's work scarcely seems satisfactory. His view of the subject appears to have a fundamental incoherence, which shows itself in various ways on the surface of his exposition, but of which the root lies much deeper, in his inability to harmonize different lines of thought: though each of these is separately pursued by his patient, powerful, and comprehensive intellect not only to results always interesting and suggestive, but often with remarkable closeness and precision of method. This incoherence I must attempt to exhibit, as far as is possible. Let us begin by asking what Mr. Spencer means by psychology. In his first chapter (§ 7) he contrasts the "psychological" with the "physiological" point of view, and afterwards uses several times the cognate antithesis of "psychical" and "physical." At first sight this pair of terms seems intended to express what Hamilton calls natural dualism, that view of the relation of mind and matter which the post-cartesian philosophy has been continually trying to transcend, but which the progress of physical science since Descartes has only rendered sharper and more definite. Thus in § 18 we are told that "without questioning the truth of the assumed correlation between the changes which *physically considered* are disturbances of nerves, and those which *psychically considered* are feelings, it may be safely affirmed that physiology, which is an interpretation of the *physical* processes that go on in organisms in terms known to physical science, ceases to be physiology when it imports into its interpretations a *psychical* factor . . . here we are treating of nerve-actions on their physiological side, and must ignore their psychological side." From this passage we should infer that psychology treated of feelings, and physiology of nerve processes; and a similar inference is suggested by other passages, as (*e.g.*) § 76, "the psychical relation between two feelings answers to the physical relation between two disturbed portions of grey matter." At the same time, between the two passages quoted (in § 53) he has used psychology in a wider sense, so that only one division of it—subjective psychology—has for its subject-matter the states and relations called "psychical" in the above-quoted passages. Though § 18, &c., would have led us to infer that this was psychology proper, in § 53 it is not even presented as the most impor-

tant part of the study, but as secondary to objective psychology.

What then is objective psychology? We should naturally guess it to be the physiology of the nervous system (what in § 57 is called neuro-physiology)—the study which deals with those "physical changes" which he regards as correlative to "psychical changes." And this would be confirmed by the fact that Part i., entitled "The Data of Psychology," is chiefly and for the first five chapters entirely occupied with the structure and functions of the nervous system; and by the opposition (in § 37 and elsewhere) of "objective changes or nervous actions" to "subjective changes or feelings."

But in truth one of the most original and suggestive of the new points of view which we owe to Mr. Spencer is the distinction between objective psychology and physiology. Objective psychology as he defines it does not deal with nervous actions or changes in the organism as such, but with the connexion between the relations of these and relations among the phenomena of the environment. Indeed in § 53 he seems to give this as the definition of psychology generally, and thus to present quite a different antithesis between psychology and physiology from that which the corresponding adjectives have been used to express. Thus "subjective psychology" would not be the study of "feelings or mental states considered in themselves, but in their relation to the environment." But in § 57 he describes Part ii., as occupied with "the natures of particular modes of consciousness, as ascertained by introspection" without any reference to the environment: which is also ignored through the greater portion of Part ii.

My conclusion on the whole is that the subject divides itself for Mr. Spencer into three portions: (1) physiology supplying those facts respecting the nervous system which form the "data of (objective) psychology;" (2) objective psychology which surveys the relation of the organism and its changes to changes in the environment, and "the totally independent science of subjective psychology, treating of feeling or consciousness." But if so, his terminology should have been made to correspond throughout with this view.

So far, though the antithesis of "psychical" and "physical" seems involved in some confusion, that of "subjective" and "objective" has remained clear. "Feeling and nervous action" are "the subjective and objective faces of the same thing," although it is not objective psychology but physiology that investigates these "objective faces" considered in themselves. But soon this second antithesis gets confused in its turn. In § 53 "subject" seems to be used as an equivalent term for "organism;" and again, in § 81, feelings are spoken of as having a "subjective origin," when the meaning is that they are originated within the organism. In fact we may say generally that when Mr. Spencer is considering the relation between the organism and the environment he uses "subjective" as equivalent to "internal;" but when he is considering the relation between feeling and nervous action he restricts "subjective" to the former.

But our perplexities are only just beginning. In Part i., as I have said, the view of natural dualism is sharply and clearly given. Although thoughts and feelings are so inseparable from nervous action that we may fairly speak of the two as "subjective and objective faces of the same thing," yet Mr. Spencer says "we remain utterly incapable of seeing, and even of imagining, how the two are related;" and so mind still continues to us something without a kinship with other things, and subjective psychology a totally unique science."

It is to be observed that a certain carelessness of terminology is involved in speaking of mind as the subjective counterpart of nerve-action, as on Mr. Spencer's view this is only one aspect of mind. Objective psychology is, as we

have seen, the study of mind in another aspect, and accordingly we find in cxi. of Part iv. that "intelligence *consists* in the establishment of correspondences between relations in the organism and relations in the environment." We need, therefore, a word less ambiguous than mind to express that which subjective psychology specially contemplates. A word commonly used is "consciousness," and this Mr. Spencer employs in § 56 in the restricted sense, which we want. "Thoughts and feelings constitute a consciousness . . . until it acknowledges its indebtedness to subjective psychology objective psychology cannot legitimately use any terms that imply consciousness."

But in Part iv., § 179-80, Mr. Spencer speaks as if—so far from our being "utterly incapable of seeing" how consciousness and nervous action are related—we could see how the former naturally arises at a particular stage of development of the latter. Here the prominent distinction between psychical changes or consciousness and physical changes would seem to be that the former make a successive unbroken series. We are told that the "differentiation of psychical from physical changes" is slight in creatures like starfish and centipedes; until the seriality of the changes is complete they are to be regarded as only "incipiently psychical." But as soon as there results an "unbroken series of changes *there must arise a consciousness.*" I can scarcely conceive that when this was first written (in 1855) Mr. Spencer would also have written the passages quoted from Part i.

But if in developing his objective psychology Mr. Spencer shows a tendency to move from the dualistic view of Part i. towards materialism, his subjective psychology is open to a complaint of exactly the opposite kind. I have before noticed the twofold relation in which, in the view of Natural Dualism, matter stands to mind. A peculiar portion of it, nerve-matter, is so related to mind that changes in it always accompany mental states; but again, matter generally is the object of mental processes—perception and thought. We have been so far occupied with the first relation. But the least reflection will show that this involves the second. For when, after thinking of material phenomena as facts inseparably connected and yet totally without kinship with mental phenomena, we turn to give an account of these latter, it is obvious that we must include among them those very thoughts of material phenomena which we have just been thinking—representative cognitions of matter; and as all are agreed that these are derived from perceptions or presentative cognitions, we must include also these latter. But in Part ii. c. 2 on the "Composition of Mind" no mention is made of cognitions of matter. We are told that "The proximate components of mind are feelings and the relations among feelings;" these latter being afterwards explained to be transitions from one feeling to another. The term feeling is no doubt a very general one, and might be used to include cognitions of matter. But not only does Mr. Spencer subdivide the class of feelings into emotions and sensations, making no mention of such cognitions, but afterwards when he comes to speak of perception (e.g. iv., cviii., § 211) he analyses it into sensations and relations among sensations. "Every perception must be made up of combined sensations, and must so be in one respect sensational . . . sensations are primary undecomposable states of consciousness, while perceptions are secondary decomposable states, consisting of changes from one primary state to another," or more exactly "when consciousness is almost wholly occupied with changes—with the relations among sensations—and sensations are present so far only as is needful for the establishment of relations among them, we have the condition of consciousness called perception."

And when in § 480 he gives the completer classification

of mental phenomena, which should perhaps have been given in Part ii., we find that in all the four sub-classes of the class of cognitions, (1) presentative, (2) presentative-representative, (3) representative, (4) re-representative, consciousness is occupied with relations among sensations and faint copies of sensations.

And further, though in Part ii. feelings are said to "occupy space" and to be "related to other feelings in space," so that cognitions of extension (though not of matter) are incidentally recognised: in Part vi. we find the cognition of extension, or space-intervals between feelings, hypothetically analysed into cognition of possible time-intervals, "a relation between co-existent positions represents a relation between successive positions;" and therefore the ultimate analysis of consciousness seems to leave us only feelings and relations of (1) likeness and unlikeness, and (2) order in time—actual or hypothetical—among feelings.

We come then to this rather singular result: on the one hand material processes are described as facts, "totally without kinship with feelings," and on the other hand the cognitions of these material processes are analysed into feelings and transitions between feelings—which are themselves, as Mr. Spencer takes care to point out, momentary feelings. Though in Part ii. the reader's faculty of representing matter in motion is strained to the utmost to conceive the molecular processes in nerve-centres and nerve-fibres which are supposed to accompany feelings and relations, these representations are not there recognised among the mental phenomena upon which he is asked directly to reflect. But incidentally he is told that the "conception of an oscillating molecule is built out of many units of feeling," and the analysis of the latter half of Part vi. shows how it is so built. Thus, though matter when viewed as cause or inseparable concomitant of mind seems totally without kinship with it, matter viewed as object of mind seems to resolve itself into purely mental elements. The dualism so explicitly maintained on the one side seems evanescent on the other; and we seem landed in the pure subjectivism, or what may be called constructive Humanism, of Professor Bain.

But this conclusion Mr. Spencer repudiates in the strongest way: as *e.g.* in § 88, at the conclusion of the chapter on "The Relativity of Feelings," he tells us that, although "our states of consciousness are the only things we can know," we cannot prove this without "tacitly or avowedly postulating an unknown something beyond consciousness." Now in saying this he seems to me to misapprehend the nature of the postulate to which he refers; and the misapprehension is of fundamental importance. In the chapter which § 88 concludes (Part ii. c. 3) he has given an elaborate proof of the proposition that, "though internal feeling habitually depends upon external agents, yet there is no likeness between them either in kind or degree." The feeling, he argues, is an effect which varies quantitatively and qualitatively according to the specific structure of the organism, its individual structure, the part affected, the condition and motion of that part, &c., while the cause remains the same. All this is most important to notice, and no one has ever put it better than Mr. Spencer. But in conceiving these organisms and the matter acting on them we are conceiving systems of material particles, extended, solid, heavy, of definite size and shape, definite mutual relations, continually changing in a definite manner; and further our conviction of the cogency of Mr. Spencer's arguments depends on the assumption that the representations of matter in motion involved in our apprehension of these arguments are *true* representations, or sufficiently near the truth; and that cognition of truth should not be the same in all consciousnesses is strictly inconceivable. It

is then not an "unknown something," but a very definitely known something that Mr. Spencer has been postulating; viz.: matter extended in three dimensions, solid, subject to mechanical laws, moving, vibrating, &c. If now these definite conceptions of something other than consciousness (though its object) are invalid, the argument that has used them must be invalid too. No process of inference can at once destroy its own assumptions and establish some further conclusion.

But to return: for I am examining the consistency of Mr. Spencer's conclusions rather than his arguments. Suppose the postulate to be that an unknown something beyond consciousness exists: we may at least expect that the state of consciousness in which we think of this unknown something (in so far as we can be said to think of it) shall be carefully examined and compared with other elements of consciousness. For we observe that when a metaphysician (if I may apply the invidious term to Mr. Spencer) announces that some object of thought is "unknown," it is not quite certain what he means by it. *E.g.* in the first chapter of Part ii. Mr. Spencer argues that the substance of mind is unknown, at the same time holding that we cannot but think in mind something that "persists in spite of all changes and maintains the unity of the aggregate in spite of all efforts to divide it." Other thinkers again (*e.g.* Cousin and Mansel) declare that mind is directly known to us as substance. But when asked what they know about it (apart from its varying phenomena), they can only predicate persistence and unity, so that their knowledge comes to much the same as Mr. Spencer's ignorance.

What then is our exact nescience of this "something beyond consciousness?" Here again Mr. Spencer's different utterances are hard to reconcile. Sometimes he seems quite in earnest with its "unknownness," *e.g.* in § 448, he speaks of this "consciousness of something which is yet out of consciousness" as "indefinable," and contrasts it with "the vivid and definite states of consciousness known as sensations." On the other hand in an interesting discussion of the scope of logic, introduced for the first time in this edition (§ 302-305), he tells us that "logic . . . contemplates in its propositions certain connexions predicated, which are necessarily involved with certain other connexions given: *regarding all these connexions as existing in the non-ego*—not, it may be, under the form in which we know them, but in some form." But in § 473, where Mr. Spencer illustrates by a diagram his "Transfigured Realism," the view seems to be this: although we cannot say that the real non-ego resembles our notion of it in "its elements, relations, or laws," we can say that "a change in the objective reality causes in the subjective state a change exactly answering to it—so answering as to constitute a cognition of it." Here the "something beyond consciousness" is no longer said to be unknown, as its effect in consciousness "constitutes a cognition of it." We know more about it than merely that it exists, though only this, that the changes in our consciousness exactly answer to the changes in it. But there is yet another view which some passages suggest: viz., that the non-ego, however unknown in other respects, is rightly thought as "Force." It is not merely that he speaks (as in § 63) of "outlying activities" and "external forces," for it might be said that by "activity" and "force" is merely meant the cause of change, so that this view might coincide with the previous one. But in the chapters in which Mr. Spencer describes what he calls the "differentiation of subject and object," he explains how I come to be conscious of a force without me "somehow allied to that which I distinguish as force" in myself, and how "the root-conception of existence beyond consciousness becomes that of resistance plus some

force which the resistance *measures*." If this conception be legitimate and valid, as I understand him to argue, the "unknownness" of the non-ego is still further reduced.

But whether the "something out of consciousness" be (1) really unknown and only reached in an "indefinable" consciousness, or (2) knowable in respect of the connexions of its parts, or (3) known in so far as the changes in it "exactly answer" to changes in consciousness, or (4) rightly thought as force, akin to and measurable by our own sensations of muscular effort, it seems at any rate clear that it is not extended and solid, not the material world believed in by ordinary men. And when in the physical parts of his treatise (as in the development of objective psychology generally) Mr. Spencer seems to have in view the material world of Common Sense, we easily suppose him to regard it *quâ* solid, extended, &c., as merely "phenomenal."

It only remains to ask how he justifies this view as against common sense. We look for this justification in Part vii., where he undertakes to show the "congruity with other dicta of consciousness" of that view of subject and object which he has assumed throughout.

But—and here is the last surprise that I have in store for the reader, which will, I fear, reduce him to a state of hopeless bewilderment—Mr. Spencer's very original argument, which is conducted through eight chapters with much earnestness and intensity of conviction, is not *against* but *for* Common Sense! We have naturally associated this Absolute of his, which is the cause of our sensations and perceptions but inexorably refuses to resemble any of them, this "mysterious" something out of consciousness, just reached in an "indefinable" consciousness with the "Ding an Sich" of Kant, or the Noumena that play hide and seek with us in several chapters of Mr. Mill's Logic; when suddenly Mr. Spencer turns round and fires his argument full in the face of Kant, Mill, and "metaphysicians" generally. He tells us that "metaphysicians" illegitimately assume that "beliefs reached through complex intellectual processes" are more valid than "beliefs reached through simple intellectual processes;" that the common language they use refuses to express their hypotheses, and thus their reasoning inevitably implies the common notions which they repudiate; that the belief of Realism has the advantage of "priority," "simplicity," "distinctness." But surely this prior, simple, distinctly affirmed belief is that of what Mr. Spencer terms "crude Realism;" the belief that the non-ego is *per se* extended, solid, even coloured, (if not resonant and odorous). This is what common language implies; and the argument by which Mr. Spencer proves the relativity of feelings and relations, still more the subtle and complicated analysis by which he resolves our notion of extension into an aggregate of feelings and transitions of feeling, lead us away from our original simple belief—that (*e.g.*) the green grass we see exists out of consciousness as we see it—just as much as the reasonings of Idealism, Scepticism, or Kantism. He says himself that "the *primitive* belief" that redness exists as such out of the mind . . . . "is thus rendered as hard for the psychologist to entertain as *its opposite* is hard to entertain for the uncultivated." But when "the psychologist" (whom I suppose we must carefully distinguish from the metaphysician) has got rid of this "primitive belief," what becomes of the "argument from priority?" when he has further shown that our apprehensions of space are relative and indeed has elaborately analysed order in space into hypothetical order in time symbolized by co-existent feelings—what becomes of the "argument from simplicity?" and when the object is left an "indefinable" something, to whose nature we perhaps vaguely attain by represented feelings of muscular tension, what becomes of the "argument from distinctness?"

Really the long discussion in Part vii., in which Mr. Spencer first seems to be maintaining Natural Realism and then proceeds to denaturalize it, has all the serious incongruity of an intense metaphysical dream.

Here I must conclude. Whatever may be the case with the ego and the non-ego, Mr. Spencer's opinions about them seem to me certainly "unknowable." None the less must it be said that the execution of separate portions of the work is often admirable. Of the new matter we may especially select for praise the physiological exposition in Part i. and the discussion of the social sentiments in Part viii. But, throughout, the great range of exact knowledge possessed by Mr. Spencer, the originality of his treatment and leading generalizations, the sustained vigour of his scientific imagination, the patient precise ingenuity with which he develops definite hypotheses where other thinkers offer loose suggestions, are no less remarkable than the mazy inconsistency of his metaphysical results.

H. SIDGWICK.

## Notes on Scientific Work.

### Botany.

**The Embryo of Grasses.**—Few points in vegetable morphology have been more debated than the interpretation of the gramineous embryo. The plumule enclosed in a sheath (pileola) lies upon a large cushion-like body (the scutellum or hypoblast), and on the opposite side of the plumule is an additional minute body (the lobule or epiblast). Without enumerating all the views that have been held with regard to these three structures it is sufficient to mention that the older botanists agreed with Mirbel in regarding the scutellum as a cotyledon, while, more recently, the view of Richard has been generally adopted, according to which the pileola is the cotyledon, and the scutellum and lobule stem structures. This view has been ably supported by Clarke (*Trans. Linn. Soc.*, vol. xxii.), and the strong argument in favour of it was the impossibility of regarding both pileola and scutellum as foliar organs, inasmuch as they would in that case represent two superimposed leaves upon the same side of the axis. Van Tieghem suggests (*Ann. d. Sc. Nat.*, 1872, pp. 236-276) that the pileola is stipular, which prepares the way for accepting the cotyledonary theory of the nature of the scutellum. This would make the cotyledon play the same part as in palms and *Liliaceæ* of an organ for absorbing the nutriment stored up in the albumen. Hanstein (see *Academy*, Sept. 1st, 1872, p. 328) fully supports the revived and no doubt correct theory of Mirbel. It may be remarked that, standing alone, Van Tieghem's argument that the vascular tissue of the scutellum ought to form a loop if it is not a foliar organ is not very weighty. What view is to be taken *now* of the embryo of *Zostera*?

**Reproduction of Lycopodium.**—J. Fankhauser (*Bot. Zeitung*, 1873, pp. 1-6) has supplied what has long been a great desideratum in the life history of the higher cryptogams. *Selaginella* alone, amongst the *Lycopodiaceæ*, possesses two kinds of spores, one of which ultimately produces the embryo, with the intervention of a prothallial stage. The details of the reproduction of this genus have been completely worked out by De Bary and Pfeffer. *Lycopodium*, however, has spores of only one kind, and no one has hitherto succeeded in tracing the further development of these. Fankhauser has lately found attached underground to young plants of *L. annotinum* a curiously grooved and lobulated body, which proves to be a prothallus bearing, like that of *Ophioglossum*, both archegonia and antheridia. This important discovery would seem, therefore, to entail the removal of the isosporous *Lycopodiaceæ* to the neighbourhood of Ferns. It is comprehensible that *Lycopodium* might merely have a homoplastic agreement with *Selaginella*. What, however, are we to say in the case of the carboniferous *Lycopodiaceæ*, of which *Lepidostrobus* and *Flemingites* agree with *Lycopodium* in only having had spores of one kind, while *Triplisporites*, like *Selaginella*, had two kinds?

**Distribution of the Cupuliferae.**—An elaborate memoir by Cérstedt (*Vidensk. Selsk. skr.*, 1871) is devoted to a preliminary study of existing *Cupuliferae*, principally with reference to their relations to fossil species. These were to have been discussed in the concluding portion, but of this the death of the author has unfortunately deprived us. His classification differs somewhat from that adopted by De Candolle in the *Prodromus*. Three suborders, *Fagineæ*, *Quercineæ*, *Castanineæ* are established; the last, having the styles stigmatic only at the apex, is distinguished by this character from the first two, in which the styles are stigmatic on their inner surface. *Fagineæ* comprises *Fagus* and *Nothofagus*, a genus constituted for the beeches of the southern hemisphere.

*Quercinae* consists, besides *Quercus*, as limited by CErsted, of *Cyclobalanopsis*, a small group of oaks with the habit of chestnuts from S.E. Asia. *Castaninae* is formed of *Castanea* and two new genera, *Pasania* and *Cyclobalanus*, formed of species which De Candolle reckoned amongst oaks. Each of these suborders has had its own centre of distribution: the chestnuts in the Malayan Archipelago, the oaks in Mexico. At the present epoch, however, the beeches are widely scattered, and their centre of distribution must be looked for in the past. *Fagus sylvatica* is European, *F. ferruginea* belongs to N. America, and *F. Sieboldii* is limited to Japan; the species of *Nothofagus* inhabit South Chili, New Zealand, Terra del Fuego, and Tasmania. CErsted thinks that Japan supplied the connecting link between the northern and southern areas—*F. Sieboldii* being the only species in the north with the characteristic nervation of the south. The existing flora of Japan as well as that of New Zealand, Tasmania, and Chili is miocene in character; and beeches existed at any rate in the pliocene, since *F. sylvatica* has been found in deposits of that age in the valley of the Arno. Although CErsted seems to have held that the three divisions of the *Cupulifera* originally diverged from a common stock, he appears also to have regarded the present world distribution of the family as implying that the species spread from three equatorial centres as they augmented in number. Transitional forms arose from the blending of the expanding areas belonging to each group; but this seems a somewhat violent supposition. *Cyclobalanus* is the form of *Castanina* most remote from oaks and beeches; of the other genera of the Indo-Himalayan region *Castanea* approaches the beeches, *Pasania* the oaks; *Cyclobalanopsis* in the same region approaches chestnuts. It is hardly possible to understand how these genera could have arisen by anything like natural hybridism. Nor does CErsted favour the view which has been maintained by Grisebach, that identical climatic conditions are correlated with similarity of organization, inasmuch as he remarks its inability to explain the existence of the *Ilex* section of oaks under the same latitude all round the world, although under very different climates. The only reasonable explanation of intermediate generic forms is that they represent a more generalized type, belonging to a stage in the genetic series antecedent to the appearance of those they connect.

**Production of Alkaloids in Cinchona.**—Howard states (*Pharm. Journ.*, Jan. 11, 1873) that 20 lbs. of the dried leaves of *Cinchona succirubra* yielded on analysis only a minute quantity of cinchonidine, which he is inclined to attribute to the accidental presence of a minute fragment of bark. This appears to prove that the leaves play no direct part in the formation of the alkaloids. Plants form their albuminoids probably in the stem-tissues from the starch, or substances derived from starch, supplied by the leaves and the ammoniacal salts taken up by the roots. The alkaloids of cinchonas are no doubt formed from the same materials, and the results obtained by Broughton (see *Academy*, February 1st, 1873, p. 49), in which increased manuring with ammoniacal compounds produced an additional amount of alkaloids, would seem to indicate that the formation of alkaloids was a means by which the plants got rid of superfluous nitrogen. This is confirmed by the consideration that the alkaloids are stored up in tissues, which being continuously renewed internally and desquamated externally are only temporarily a part of the plant's economy.

**The Secretory Canals of Plants.**—In a lengthy paper on this subject in the *Annal. des Sciences Nat. (Botanique)* for November, 1872, Van Tieghem draws the following conclusions:—Coniferæ, he states, never possess canals in the primary cortical parenchyma of the root; but this is the only region from which secretory organs are entirely absent in this order. All the other tissues of the plant may contain them, and in this respect six principal modifications may be distinguished, as follows:—1. No canals in the root nor stem; *Taxus*. 2. No canals in the root; canals in the cortical parenchyma of the stem; *Cryptomeria*, *Taxodium*, *Podocarpus*, *Dacrydium*, *Torreya*, *Tsuga*, *Cunninghamia*. 3. No canals in the root; canals in the cortical parenchyma and in the pith of the stem; *Ginkgo*. 4. A secretory canal in the root; canals in the cortical parenchyma of the stem; *Cedrus*, *Abies*, *Pseudolarix*. 5. Canals in the wood of the fibro-vascular bundles of the root and of the stem; canals in the cortical parenchyma of the stem; *Pinus*, *Larix*, *Picea*, *Pseudotsuga*. 6. Canals in the liber of the fibro-vascular bundles of the root and of the stem. Canals in the cortical parenchyma of the stem; *Araucaria*, *Widdingtonia*, *Thuja*, *Cupressus*, *Biota*. In Cycadeæ the canals are found disseminated through the cortical parenchyma of the stem; the pith of *Cycas* appears destitute of them. In their distribution they resemble that which occurs in Coniferæ of the second class. The author considers secretory canals to be the highest degree of development of the secreting organs of plants.

**Parasitism and mode of Propagation of Lichens.**—Two important papers on this subject appear in the *Annal. des Sciences Nat. (Botanique)* for November, 1872. Janczewski, in a paper on the Parasitism of *Nostoc lichenoides*, refers to the fact that what were at one time described as the "bulbils" of *Anthoceros laevis* are now generally acknowledged to be small collections of a *Nostoc* parasitic on the tissue of the leaf. They are still, however, considered by Hofmeister to be the organs of reproduction of the *Anthoceros*, although he never

saw them escape from the parent plant. The writer found stomata on the under side of the frond of *Anthoceros*, which had not before been observed; the upper surface of the frond being entirely destitute of these organs. It is these stomata that are attacked by the *Nostoc*, and the writer succeeded in artificially inoculating them with the parasitic alga. The same parasitism was observed of the *Nostoc* on the leaves of *Blasia pusilla*; and the same parasite was found to attack the largest of the two kinds of cells of which the leaf of *Sphagnum acutifolium* is composed. The alga is also parasitic on the rhizome of *Cycas* and of *Gunnera scabra*. The second paper is by Woronin, *Researches on the Gonidia of the lichen Parmelia pulverulenta*. He confirms the previous observations of Famintzin and Baranetzky that the gonidia of this lichen and of *P. parietina* produce zoospores, which he describes as bi-ciliated, and gives an exact account of their mode of escape from the gonidia. These zoospores, after the cessation of their vibratile motion, caused by the cilia, become covered by a membrane after the ordinary manner of the zoospores of Algae, and form themselves into gonidiform bodies, increasing by division, but producing neither filaments nor hyphæ, but only giving birth to new gonidia; in other words, to young individuals of a unicellular alga of the genus *Cystococcus*. This observation of the actual germination of the zoospores he states to be a link in the chain hitherto wanting. Woronin sums up strongly in favour of Schwendener's much disputed theory that Lichens are not independent organisms, but are composed of Fungi parasitic upon Algae (the so-called gonidia), though he considers a further series of very careful experiments will be necessary either to prove or disprove the theory. Both papers are beautifully illustrated by plates.

**Introduction of Loranthus Europæus into Ireland.**—This parasite, belonging to the same natural order as the mistletoe, is well known in the south of Europe, but attempts to introduce it into this country have hitherto failed. Dr. David Moore, the curator of the gardens of the Royal Dublin Society at Glasnevin, has at length succeeded in growing it on two species of oak. The methods hitherto attempted had been by either placing the seed of the parasite outside the bark or beneath the epiphloeum or endophloeum, resting on the albumous wood, but these had not been successful. It occurred to Dr Moore to bruise gently the soft bud on a young shoot of the previous year, and to insert the seed of the parasite in the centre of the partially bruised young bud; and by this method two of the seeds germinated, the seeds remaining dormant and only covered over with their viscous gelatine for more than a twelve-month after their insertion before they began to shoot. The following parasites are also now successfully grown in the Glasnevin Gardens:—*Orobanche Hederae* and *minor*, *Lathraea squamaria*, and six species of *Cuscuta*, as well as the mistletoe, which is not a native of Ireland.

**A New Potato-disease.**—E. Hallier describes in the *Zeitschrift für Parasitenkunde*, 1873, Bd. 4, Heft 1, a new potato-disease which has appeared in the crop at Apolda, near Jena. The disease differs from the one ordinarily known in this country in attacking at once the tubers and not the leaves. The tuber is found to be covered by a purplish felt, which is the mycelium of a fungus; the skin of the potato is in some cases apparently not penetrated by this mycelium, while in others close examination with the microscope shows that it is, the skin being in these cases covered by a number of black spots having the appearance of the perithecia of a pyrenomycetous fungus, the tuber becoming then completely destroyed by a cancerous disease; the fungus, which probably belongs to the genus *Sclerotium*, appearing always to accompany the disease. Prof. Hallier thinks that the remedy will probably be the same as in the ordinary potato-disease, selecting early kinds, using only mineral and no animal or vegetable manures, and a careful selection of the best adapted soil. At Apolda the geological formation is the Keuper; the past summer was remarkably dry, the disease appearing in the autumn.

### Physiology.

**Special mode of Development of certain Batrachians.**—In a letter printed in the *Revue scientifique*, No. 37, 1873, M. Jules Garnier communicates some remarkable observations that have been made by M. Bayay on certain Hylodes which exist in large numbers in the Island of Guadaloupe. These animals are widely distributed over the island, being found not only near the sea, but in the higher lands of the interior, and after rain their croak makes the air resonant. The physical features of Guadaloupe, a volcanic island the soil of which is composed of tufa, pozzuolana, and similar material, are so peculiar and so very unfavourable for the maintenance of tadpole life, which is essentially piscine, that M. Bayay was led to expect the existence of some peculiarities of development. The ova were easily procured, as they were everywhere present under moist leaves. No tadpoles could be discovered, but many of the frogs were of an extraordinarily minute size. The eggs were spherical, with a diameter of from three to four millimeters, and were each provided with a small spheroidal expansion resembling a hernia of the gelatinous mass through a pore in the envelope. In the centre of the sphere the embryo was visible, lying on a vitelline mass of a dirty white colour, and having a thin body, a large head, and four styliform

members with a recurved tail. When the egg was touched the embryo moved rapidly and changed its position. A day later the embryo was perfect, coloured, with a tail as long as the body, translucent, and like that of a tadpole. The limbs immediately formed, and at the expiration of a few days little frogs of a dark greyish brown colour, and *without a vestige of a tail*, escaped from the egg. M. Bavay's observations have established the following facts:—1. That this *Hylodes martinicensis* commences life by a rotatory movement of the future embryo. 2. The fully formed embryo performs the rotatory movements more rapidly, but in a horizontal plane. 3. The branchiæ make their appearance, and again vanish sometime afterwards. 4. The larva in the ovum is provided with a tail and limbs. 5. The tail of the larva not only facilitates the movements of the imprisoned animal, but also aids respiration by the numerous and minute vessels which ramify in this highly developed appendage. 6. The animal issues from the egg in the form which it preserves throughout life. As M. Garnier observes, these observations seem to constitute a starting-point for a special investigation of great importance, and have a close relation to the question of the adaptability of species to surrounding conditions. It may be asked in this case whether the frog has been created with special modifications adapting it to live in an island destitute of marshes, or has it in course of time acquired a new mode of development enabling it to survive under the exceptional conditions under which it has been placed?

**Histology of the Retina of the Horse.**—C. Golgi and N. Manfredi (*Giornali della R. Acad. di Med. di Torino*, August, 1872, abstract in *Centralblatt*, February 1st, 1873) state that if the fresh eye of the horse be macerated in dilute (0.25 to 0.75 per cent.) solution of bichromate of potash, or of chromic acid (0.05 to 1.10 per cent.) the retina separates from the swollen layer of the rods and cones and the layer of outer granules, and splits with great readiness into three laminae. The innermost of these is composed of the optic fibre layers, to which here and there a ganglion cell is adherent. The middle lamina is composed of a layer of grey substance, in which a large number of ganglion cells are imbedded together with the adjoining part of the internal granule layers. The third and outermost lamina is composed of a part of the internal granule layer, together with the intergranule layer. Intercalated in the first named lamina the authors find numerous branched connective tissue cells closely resembling the interesting cell—elements described by M. Golgi in the central organs of the nervous system. In the second lamina these connective tissue cells are likewise very frequent. The intergranule layer of the third lamina consists chiefly of large cells of very irregular form. They are so flattened as to form very thin transparent lamellæ of homogeneous or finely granular aspect and very delicate margins. Their processes are extraordinarily numerous, which appear to be for a considerable distance mere prolongation of the cell body; but their extremities are highly refractile and homogeneous, and present varicosities like those of the optic fibres. The processes of adjoining cells anastomose freely and form a compact network or felt. Besides these typical cells other smaller but likewise flattened cells are found in the intergranular layer. These are highly granular and have fewer processes.

**Regeneration of the Eyes in the Crab.**—At the meeting of the Académie des Sciences of Paris, 27th January, 1873, M. Chautran read a paper detailing some experiments which he had made, in M. Coste's laboratory, upon the regeneration of the eyes of the crab. Considerable differences occur in the perfection of the regenerative process, and depend both on the age of the animal and the relation of the operation to the period of moulting. After the eyes had been removed from a crab one year old, and captured in August, just after the moulting of the shell, they were perfectly restored, the new ones assuming the normal form and functions. If, however, the operation be performed on one taken in the month of May before moulting, the process of regeneration is seriously interfered with by the casting of the skin; the eye is then regenerated of abnormal form and size. In adults, again, the new organ is very imperfect.

**The Poison of Pahonim.**—This poison, obtained in the Gaboon district, acts, according to MM. Carville and Polaillon,\* extremely energetically upon the heart, five milligrammes of the impure alcoholic extract being sufficient to kill a dog weighing fifty-four pounds. It produces death by arresting the action of the heart, and this effect is produced by the abolition of the contractility of the cardiac musculature in the first instance and subsequently of the other muscles. When introduced into the pericardium it stops the action of the heart more rapidly than when the same quantity is injected. It does not abolish the excitability of the nerves. It kills without apparently affecting either the great sympathetic, the encephalon, the spinal cord, or the pneumogastric. It acts feebly on a curarized frog, but there is no antagonism between the curara and the poison. It acts less swiftly by absorption through the stomach than by cutaneous absorption. As compared with digitaline and antiarine, the oily and uniform extract of the poison acts more rapidly than the same weight of the crystallized principles of digitalis and of the *Upas Antiar*, but the marked effects are later in appearing. It interferes with the movements of the heart of the snail and ends by killing it, whilst this effect cannot be produced by digitaline. It causes vomiting in the higher animals.

line and antiarine, the oily and uniform extract of the poison acts more rapidly than the same weight of the crystallized principles of digitalis and of the *Upas Antiar*, but the marked effects are later in appearing. It interferes with the movements of the heart of the snail and ends by killing it, whilst this effect cannot be produced by digitaline. It causes vomiting in the higher animals.

**Action of Muscles determined by Electricity.**—In a recent number of the *Mouvement médical* (see abstract in the *Medical Record*, March 5th, 1873) Dr. Onimus gives the results of some experiments he was permitted by the authorities to make on the body of a criminal who had been guillotined. He found that by acting upon the intercostal muscles the external intercostals elevate the ribs, while the internal intercostals depress them. This is best seen when the upper rib of the intercostal space which is faradized is fixed; the lower rib is then raised, while if the internal intercostals be faradized it remains in the same position. The action of the external seems to be more powerful than that of the internal muscles. The *Pteronius longus* depresses the internal edge of the foot and acts slightly as extensor and abductor of the foot, as shown by Duchenne, of Boulogne. M. Onimus was unable to efface the vault of the sole of the foot by the action of the *tibialis anticus*. Muscular contractility is not lost simultaneously in all the muscles. The first muscles to lose their excitability are the diaphragm and the tongue, and after them come the facial muscles. The *masseter* retains its faradic excitability longer than any other muscle of the face. In two, and a half to three hours after death the contractility is quite lost in all of them. In the limbs the extensor muscles go first; the flexors retain their sensibility about an hour longer. Five or six hours after death the muscles of the trunk still answer to faradization; the abdominal muscles are more especially tenacious in this respect. This corresponds to the fact that in more or less general palsies these muscles are the last to become affected, and it is well known that in many forms of paralysis the extensors suffer more severely and sooner than the flexors. As the muscular contractility becomes enfeebled the way in which the contraction presents itself becomes altered. The substance of the muscle appears to rise first at the points of contact with the electrodes, while the intermediate part responds very slowly; it gradually declines, and in time ceases to answer at all, although a response still takes place at the electrodes. At this stage the muscles do no longer answer to percutaneous faradization, but may still respond to the same stimulus directly applied to their tissue.

**The Innervation of the Lacrymal Gland.**—This subject has recently been investigated by Dr. Demtschenko, who has published his results in *Pflüger's Archiv* for September, 1872. His experiments were conducted on dogs, cats, and rabbits rendered insensible by means of morphia. The stimulus applied was an induced current of electricity. The quantity of fluid secreted by the lacrymal glands was estimated by the number of square centimeters of blotting paper that were moistened. Some differences in the mode of experimenting were found to be required in the different animals. In the dog and cat the lacrymal nerve could be reached from the orbit, but in the rabbit the skull had to be opened. M. Demtschenko found that no influence upon the activity of the lacrymal gland was exerted by the temporo-malar nerve, but the secretion was augmented by irritation of the sympathetic nerve. Irritation of this nerve renders the conjunctiva moist even when the lacrymal gland had previously been excited. The increased flow of tears which follows irritation of various cranial nerves, such as the frontal, infraorbital, nasal, lingual, glossopharyngeal, and pneumogastric, is not interfered with by section of the sympathetic, but is immediately checked by section of the lacrymal nerves. Chloroform narcotisation does not prevent the manifestation of this reflex action. Some differences are presented in the character of the secretion according to whether the sympathetic or the fifth nerve is irritated, being cloudy in the former case, limpid, clear, and abundant in the latter. The sympathetic nerve seems to maintain the normal degree of moisture of the eye, and the fifth the flow of tears, since in cases of paralysis of the latter nerve the conjunctiva remains moist, but the power of shedding tears is lost. Ligature of the carotid artery materially diminished, whilst ligature of the jugular vein augmented, the flow of tears following irritation of the lacrymal nerve. All conditions producing dyspnoea led to increased flow of tears.

**Function of Lingual and Chorda Tympani Nerves.**—The lingual of the fifth pair of nerves has always been regarded as a purely sensory nerve. It has lately been shown, however, that after section of the hypoglossal or proper motor nerve of the tongue, stimulation of the lingual causes movements of the tongue. M. Vulpian, who has recently studied this subject, has laid the results of his investigations before the Académie des Sciences, at the meeting held on the 20th January, 1873. M. Vulpian satisfied himself that some of the fibres of the chorda tympani nerve terminate in the submaxillary gland; but that others are certainly distributed to the tongue. He ascribes to them the singular motor power which the lingual appears to acquire after the section of the hypoglossal. He is therefore still of the opinion that the lingual is a purely sensory nerve, but he is unable to explain why the fibres of

\* MM. Carville et Polaillon On the Poison of Pahonim. A Paper read before the Society of Biology of Paris, and printed in abstract in the *Revue scientifique*, Vol. ii. Ser. ii., p. 527.

the chorda should apparently acquire a motor power after the section of the hypoglossal.

### Geology.

**Mammoth Remains in Wrangel-land.**—In 1872 a party of Americans, led by F. Pavy, left San Francisco to endeavour to reach Wrangel-land, in the Arctic Sea. They landed near the mouth of a large river running from the N.W., and about eighty miles inland observed many indications of Mammoth remains. On clearing away the snow from one of the spots the whole of a well-preserved animal of this genus was exposed to view. The head was beset with long thick white hair, and the tusks, eleven feet eight inches in length, were curved backwards towards the eyes. The animal was in a kneeling position, the hinder part of the body being deeply buried in the snow, and in such an attitude as it would take if it had died whilst endeavouring to extricate itself from the bog. In its stomach were found bark and grass. These remains were distributed for miles over the plain, and were so abundant that it appeared as if a numerous herd had perished there. The place swarms with polar bears, which live upon the bodies.—(*Verhandl. der Geolog. Reichsanstalt zu Wien.* 1873. No. 4, p. 71.)

**Quaternary Fossils of Louvern , Mayenne.**—M. A. Gaudry (*Compt. Rend.*, 1873, vol. 76, 657) has examined a number of fossils found in a cave in the carboniferous limestone at Louvern  by M. Ellert. They consist of four human molars belonging to as many individuals of different ages, the upper portion of a humerus of a man of large stature, a horn of reindeer with an incision evidently made by human hands, and numerous bones which are referred to the following species, *Hyena spelaea*, a large *Canis vulpes*, *Rhinoceros tichorhinus*, *Equus caballus*, *Tarandus rangifer*, and the bison. Most of the bones were broken and had been much gnawed by animals. At a distance of 800 metres from this cave, and in the same rock, a cavity was broken into which was filled with yellow earth, rolled pebbles, large blocks of limestone, and a great many bones. The latter are characteristic of the mammoth epoch, and in addition to the species found in the cave consist of *Felis spelaea*, *Mustela foina*, *Melis taxus*, *Arctomys marmotta*, a large hare which may be either the *Lepus timidus* or *L. variabilis*, *Sciurus vulgaris*, *Elephas primigenius*, *Sus scropha*, a stag as large as the *Megaceros Hibernicus*, some bovid  of the same size as those named *Bison priscus* and *Bos primigenius*. M. Milne-Edwards has recognised among the bird remains the genera *Anser*, *Mergus*, *Nictea nivea*, two species of *Anas*, and a femur of an unknown species of the hawk family larger than the buzzard and smaller than the *Aquila audax*. The mammifers were chiefly recognised by the teeth, the fragments of the limbs and particularly the vertebrae being so gnawed by hyenas and other animals as to be almost indeterminate. From the prevailing longitudinal fractures in the bones M. Desnoyers and others are of opinion that they are the remains of human feasts, but M. Gaudry considers that having regard to the very numerous marks of the teeth of animals it would be rash to attribute them to human agency.

**The Rocks of Griqualand West.**—Dr. E. Cohen in his second letter to Prof. Leonhard (*Jahrbuch f r Mineralogie*, 1873, part i., p. 52) gives a brief account of the rocks of Griqualand West. In the immediate vicinity of Hopetown the prevailing rock is of a greyish green colour and fine-grained to compact texture, not admitting of a ready determination of its mineral constituents. It is largely developed along the line of the Vaal, being in some places amygdaloidal, and forms high ranges and low plateaus very distinct from the table mountains and kopjes of the Karoo formation. Near Klipdrift a large-grained rock makes its appearance consisting of hornblende and a triclinc felspar, with ilmenite and a little quartz. It bears great resemblance to many of the diorites of Alsace and the Odenwald, to which group, it is probable, the close-grained rock will be found to belong. Dr. Cohen regards the crystalline variety as of later date than the close textured, having observed it near Klipdrift overlying shales and to be traversed by vein-like masses of conglomerate, and near Eskdale on the Orange River it covers and is covered by thick deposits of quartzite sandstone, proving its intrusion during their deposition. On the other hand the compact "Vaal rock" never overlies any sedimentary or other beds in the large district already examined. The sedimentary rocks are quartzite sandstone, slaty clay and conglomerate, limestone with laminated siliceous and marly bands, and a so-called jasper-slate; no fossils have yet been observed in any of them. Marly slate, with siliceous limestone overlying it, constitutes the plateau upon which Griqua-Town is situated. It runs parallel with the Vaal and the Hart rivers for 150 miles, the whole of the intervening plain being covered with thick deposits of conglomerate and the ever-present calc-tuff. The jasper-slate rises above Griqua-Town, and Dr. Cohen regards it as a continuation of that of the Asbestos mountains, and to be a completely altered sedimentary deposit. It contains bands of magnetite and fibrous quartz, but the crocidolite of the former locality appears to be wanting.

**The Granulite of Auerswalde.**—The granulite rock of Auerswalde, in Saxony, consists of normal granulite, which is made up of orthoclase

and quartz, with accessory garnet and kyanite, traversed by bands of "trap-granulite," which is a mixture of a triclinc felspar with quartz, magnetite, and a green, mica-like mineral. This interlamination, which was pointed out by Stelzner as evidence of the metamorphic character of this rock, is regarded by Prof. Naumann (*Jahrbuch f r Mineralogie*, 1872, Part 9, 911) as strong evidence of its eruptive origin. After describing the relation of the granulite to the mica-slate, as observed in several quarries and escarpments in the Chemnitz valley, between Wittgensdorf and Garndorf, he proceeds to compare the alternations of varieties of this rock with modern eruptive masses that have been met with in the Island of Ponza, at Bassiluzzo in the Lipari Islands, at the Cerro de las Nabajas, Mexico, the perlite district of Hungary, and the well-known Piperno, near Naples, &c., all of which exhibit alternations of beds or sheets of two dissimilar varieties of the same lava. Still stronger indications of the eruptive origin of these gneissoid rocks are furnished by the fragments of mica-slate, which often occur in the granulite, with their parallel lines of lamination folding over the irregular surfaces of the angular fragments, and producing in the granulite an undulating appearance; similar evidences of flowing-over wedge-shaped projections of mica-slate, often presenting nearly perpendicular sides, occasionally exhibit themselves in the quarries of the district.

Prof. Fr. M ller's long expected work, *Allgemeine Ethnographie*, will be out in a few days at Vienna. From the many-sided learning of the Vienna professor it may be inferred that it will make an epoch, as Prichard's *Natural History* did in its time.

M. Gaidoz is engaged on a work on the Slavonian race in the German Empire and on the German race in Russia, being the enlargement of two lectures of his on the ethnography of Europe which he teaches at the Paris  cole Libre des Sciences Politiques.

The only Norwegian who has ever attained eminence by writing on general physics, Professor Hartwig Christie, has died suddenly in Christiania. He was born in 1826.

## Philology.

**Early Eastern Geography.**—*Bibliotheca Geographorum Arabicorum.*—Eddidit M. J. De Goeje. Pars secunda. Viæ et Regna. Descriptio ditionis Moslemicæ, Auctore Abu 'l Kâsim Ibn Haukal. Lugduni Batavorum : apud E. J. Brill. 1873.

IN accordance with Prof. De Goeje's promise, Ibn Haukal now follows Istakhri as the second volume of the *Bibliotheca Geographorum Arabicorum*. As we showed at the time, according to De Goeje's researches (*Academy*, Oct. 1, 1871), the work of Ibn Haukal is an enlarged and corrected edition of Istakhri's book. The present edition enables every one who knows Arabic to verify for himself the relation of the two geographical works. We see that Ibn Haukal has incorporated almost the whole of Istakhri, more or less literally, in his own work without distinctly stating the fact : the ideas of the time respecting literary property differed essentially from those now prevalent. But he has made so many trifling alterations in the text of his predecessor, even when adopting it as a whole, that it would be extremely difficult, if not impossible, to show the difference between the two texts in a single edition with the help of critical notes and variants. It is far more convenient to be able to lay the two texts side by side, even in passages where they agree in essentials. A formidable critical apparatus is still, however, made necessary by the differences between later versions as well as by the carelessness of copyists. But the later work has very decided points of superiority to its original. Ibn Haukal had seen much in the course of his travels, and many of the results of his observations are included in the work. The most cursory inspection shows us how much more extensive some sections are than in Istakhri (in connection with which it may be remarked that in the edition of Ibn Haukal there is decidedly more text to a page than in that of Istakhri, where the critical portion occupies more space), and these additions are for the most part valuable. Some of the Western countries which are only scantily noticed by Istakhri are described in greater detail by Ibn Haukal ; as for instance Egypt and the rest of North Africa, Moslem Spain, and the Christian coasts of the Mediterranean. The account of Mesopotamia has also been a good deal enlarged, and unfortunately in a less degree that of Syria and Babylonia (Irak). Ibn Haukal, amongst other points, had taken much pains to procure careful information respecting the finances of different

countries and provinces, which are not wanting in sad indications of the decline of material prosperity. For most readers his lists of figures are certainly rather unintelligible ; but if a competent scholar were to undertake to examine more nearly into the nature and history of the state finances in the first centuries of Islam, he would find much valuable matter amongst the *data* furnished by Ibn Haukal as well as Belâdhori and other writers. Ibn Haukal pays particular attention to political conditions, and in this way furnishes a very welcome supplement to the historians. In his time (middle of the tenth century, A.D.) it might appear to a careful observer as if the might of Islam were drawing to its end. With the abasement of the Caliphate, which had already lasted for a century, the strength of the Arabs was really broken. Countries which had been conquered in the first centuries after the Hejira were lost to the Greeks or were devastated by their incursions. The leaders of Turkish mercenaries, Persian adventurers, and small Arabian dynasties, contended for the countries on the banks of the Tigris and Euphrates. Amongst the latter the Hamdanides stand pre-eminent. We are accustomed to regard the most intellectually distinguished member of this stem, Saif-Addaula, as the glory of his people, the light in which he is celebrated by the court poet Motanabbi, while the literary tradition of the Arabs is also very favourable to the generous prince, protector of the *beaux esprits* of his time, and himself possessed of high accomplishments. A very different account, both of him and the other Hamdanides, is given by the sober contemporary Ibn Haukal : how they ruined the cities by their extortions, forced the inhabitants to emigrate, or actually drove them into the arms of the Greeks and of Christendom. If one takes the bare facts set down by the chroniclers, the wars of the Hamdanides against foreign enemies and against each other, and their faithless policy, one is compelled to admit the justice of Ibn Haukal's severe verdict, even though it might be urged in excuse of Saif-Addaula that a petty prince who had constantly to contend for existence against both Greeks and Moslems could not be very scrupulous as to the choice of means for replenishing his war-coffers ; while his brother, Nâsir-Addaula, was compelled to follow a system of ruinous exactions by the sole weight of the tribute to be paid to Bagdad. But, everything considered, we have here a picture of a deplorable state of things of which we have no conception at all in reading Motanabbi, and we can understand the melancholy tone which appears in Ibn Haukal's description of northern Syria and Mesopotamia. He could not know that the Greek Empire was too miserably weak to maintain and follow up its advantages over the Moslems, and that Islam was about to derive new strength, at least for conquest and destruction, from the influx of the Turkish hordes. Ibn Haukal, however, is a zealous partisan of the Fatimides, whose power was just attaining fuller development. This house, whose descent from Ali was in all probability mythical, understood better than most of the other real and imaginary Alides how to lay the foundations of a State and cause it to flourish. We cannot, therefore, take it amiss that our author turned towards them. But I am inclined to doubt whether he himself was at all a Shîte so far as religious matters were concerned ; expressions like that of "so-called caliphs" for the Abbasides are at any rate to be regarded rather as an affectation than as meant seriously. What Ibn Haukal has to say about the non-Moslem world, except so far as it is to be found in Istakhri as well, is not of much special value, though even here a few interesting particulars may be met with, as for instance those relating to the great conquests of the Russians on the East and South (p. 286).

Though Ibn Haukal's changes in the text of Istakhri are

generally for the better, this is not the case quite always. Thus Istakhri says that the Kurds assert themselves to be of Arab descent (p. 115); he plainly does not believe it, but Ibn Haukal supports the absurd claim by the authority of the learned Ibn Doraid, who ought not to be contradicted (p. 187); it looks as if he had here wished to display his own learning.

No doubt Ibn Haukal would have considered it as one of the chief superiorities of his work over that of Istakhri that his maps were better. But on this point we could only judge if the original maps were before us, for they have been much disfigured in different MSS. We observed in speaking of the edition of Istakhri that Prof. De Goeje had done well in omitting the maps altogether.

Ibn Haukal's style is not always to be commended. He often expresses himself obscurely, and though, after the intolerable fashion of learned Arab authors, he frequently speaks in artistic flourishes with rhymes when simple prose would be more to the purpose, yet he has some peculiarities of style which are actually against the rules of good Arabic. Amongst these I reckon his rather frequent use of *ghair* with an indeterminate substantive in the sense of "several:" viz., *ghairu 'ainin* (p. 150) "not a spring," in the sense of "not one spring," that is to say "several springs."

Like the original work of Istakhri, Ibn Haukal's version has been in many respects altered and abridged; evidence of this is given partly by the Arabic MSS. themselves, partly by Persian translations. It is not always easy to say with certainty which is the text of Istakhri, which of Ibn Haukal, and which of the later editor. De Goeje has proceeded in this matter, as ever, with the greatest caution, though he would not claim to have distinguished with perfect exactitude between the two original texts. By the very ample critical apparatus afforded he enables the qualified reader to form his own opinion. We are particularly grateful to the editor for giving in the parts very interesting additions made to our book in a fresh version of two hundred years later, which is contained in a MS. at Paris. This reviser observes, for instance, with respect to many places of which Ibn Haukal says that they have fallen into decay, that in his time—and he generally adds the date—they are again in a flourishing condition. But this writer must have had yet another text of the original before him, and one with considerable differences from the common form. It is particularly strange to find at the beginning of the Parisian MS. a warm eulogium on Saif-Addaula, which is entirely at variance with many other passages of the book. It seems to me a question whether this passage may not have belonged to an earlier version by Ibn Haukal's own hand. The matter, at any rate, is worth investigation.

We await anxiously the third volume of this series, which is to contain Mokaddasi, a publication by which Professor De Goeje will be doing as meritorious service as by that of Baladhori, Istakhri, and Ibn Haukal.

TH. NÖLDEKE.

*Fridankes Bescheidenheit.* Von H. L. Bezzenberger. Halle: Verlag des Waisenhauses.

*Gudrun.* Hgg. und erklärt von E. Martin. Halle: Verlag des Waisenhauses.

WHEN we consider the great progress which the study of modern German literature has made in this country during the last few years we cannot but be struck by the almost total neglect of the Middle High German literature of the twelfth and thirteenth centuries. And yet the earlier is at least equal in interest to the later period, although its merits are of a totally distinct order—whence, indeed, its great value

as a corrective and supplement to the modern literature. It may safely be said that any one who acquires a thorough—not a merely superficial—knowledge of the two periods will possess a breadth and fullness of literary culture otherwise attainable only by a laborious study of several distinct languages. The nearness of the two periods, while sparing the student to a great extent the drudgery of learning a new vocabulary and grammar, yet offers peculiar difficulties, arising from this very similarity. It often happens that a word in the older language differs in meaning from its modern equivalent so slightly as often to entrap the superficial student into hastily assuming a complete identity of meaning, the result being a ludicrous mistranslation. The study of MHG. is thus an excellent training in the differentiation of word-meanings.

The title of the first of the two works now under discussion is a good example of this change of meaning. "*Bescheidenheit*" in MHG. has nothing to do with "modesty;" it means simply "wisdom," or rather "sagacity," afterwards "moderation," "reasonableness," whence the modern signification. "*Fridankes Bescheidenheit*" means therefore "Wisdom of Free-thought," the "wisdom" consisting in a collection of short proverbial sentences in rhymed metre, whose subjects are drawn from every sphere of practical life, from religion and the world of nature. Who Freidank himself was has long been a disputed question. It was at first assumed that Freidank was an assumed name, and the first critical editor, Wilhelm Grimm, conjectured that the real author was the great lyric poet Walther von der Vogelweide. This theory was never generally accepted, and after the masterly summary of the evidence on both sides given by Bezzenberger in his introduction, its untenability must be regarded as put beyond a doubt. Indeed when we see how fundamentally distinct the genius of the two poets is, and how impossible it is to reconcile the purely objective and practical tone of the *Bescheidenheit* with the intense subjectivity, passion, and idealism of Walther, we can only wonder that such a hypothesis could ever have entered the head of so sagacious a critic as W. Grimm. The scanty evidence there is tends to show that Freidank was the real name of the author, that he was of citizen family, led a wandering life, visiting Italy and the Holy Land, and died at Treviso about 1240. It only remains to be said that the present edition is, with its elaborate introduction, rhyme-index, and commentary, suited alike for the critical and the general reader. A better work for any one who is beginning the study of Middle High German could hardly be found.

With the Gudrun we enter on a totally new field of Middle High German literature, the national epos. It is characteristic of the wonderful breadth and many-sidedness of the literature that it possesses two distinct classes of epic poems—the popular, founded on the national traditions, and the "courtly" (*höfisch*), whose subjects are taken from the Old French epics. Of the popular epics the Nibelungen unquestionably deserves the first place, the Gudrun coming second. As far as its internal structure is concerned the Nibelungen stands without a rival in general literature for grandeur of conception, tragic power, and fine development of character. Formally, however, it is far from perfect, having suffered severely from the interpolations and alterations of meddling scribes. The same is the case, only in a still higher degree, with the Gudrun, which has been preserved only in one very corrupt MS. of the sixteenth century. Enough, however, remains to make the Gudrun one of the most fascinating of all MHG. epics. It no doubt owes much of its charm to its peculiar relation to the Nibelungen, which is exactly parallel to that of the Odyssey to the Iliad, although the story of Gudrun's unshaken fidelity to Herwig, on which

the poem mainly turns, is told with a purity and elevation of feeling to which the Greek was a stranger. The present edition, which forms the second volume of Zacher's Germanistische Handbibliothek, gives the readings of the MS. at the foot of each page together with critical notes. The whole work is better adapted for the advanced student than for the beginner, who cannot have a better edition than that of Bartsch in the "Deutsche Classiker des Mittelalters" (see *Academy*, vol. iii. p. 221). H. SWEET.

## General Literature.

*Collection of Hungarian Popular Poetry.* [*Magyar Népköltési gyűjtemény.*] Edited for the Kisfaludy Society by Ladislaus Arany and Paul Gyulai. Pest: Athenæum.

THE two volumes before us appear as the beginning of a new series of popular Hungarian compositions both in verse and prose—ballads, songs, tales, &c.—and the editors express a hope that collectors may still send in additional specimens in order to render the collection as complete as possible. This collection is the second that has appeared under the patronage of the Kisfaludy Society: three volumes edited by M. Erdélyi were published in the years 1846-48. To M. Erdélyi great credit is due as the first collector on any scale of the products of the Hungarian popular muse, but as might be expected his collection left great room for improvement as regards the critical arrangement and appreciation of his materials.

Since that date several partial collections have been published, some of them having a local character, such as M. Pap's collection in the Palócz dialect. Of all these partial collections the *Székely Wild Roses* of M. Kriza, published in 1863, was perhaps the most important. We believe that the materials for a second volume of the *Wild Roses* have been collected, and hopes are held out of its speedy publication. It appears from this that the Hungarians do not feel themselves so poor in fable and song as to necessitate a concentration of their forces. We suppose it is a regard for the coming volume of the *Wild Roses* that has excluded from the present collection both songs and ballads communicated by M. Kriza to various Hungarian periodicals.

Of the two volumes before us the first is a general collection, apparently intended to be representative, of pieces collected by different persons from all parts of the country, while the second is individual and local, being a collection made by Mr. Charles Török in the county of Csongrád, which may be considered as a fairly typical specimen of the Alföld, or Great Plain.

These two volumes contain between them fifteen Christmas mysteries and Twelfth Night games; one hundred and fifty ballads and narrative poems, amongst which, how-

ever, the true ballads form a minority; about five hundred songs, which form both in quantity and quality the main strength of the collection; thirty-six tales; besides an interesting collection of riddles, nursery rhymes, and children's games. It will thus be seen that the Hungarians cannot compete in the matter of folklore with such encyclopædic peoples as the Germans or Russians; but if we take into account the comparative weakness of their numbers it certainly says a great deal for the fertility of the popular imagination that so large a collection appears after so many have preceded it.

A collection of popular compositions naturally appeals to more than one source of interest. It has not only an æsthetic or purely poetical value, but at the same time occupies an important place in the history of literature. Again, as preserving or representing in their most living forms the dialectical varieties of the language, they acquire a philological value. This perhaps especially applies to those compositions which are handed down by the strictest link of tradition, such, for instance, as nursery rhymes and the verses used by children at play. Lastly, and in the opinion of many this is their most real as it is their most human importance, they reflect more faithfully than anything else the peculiar character of the people which has composed and preserved them. As M. Erdélyi has observed, the popular poetry is the guide to the psychology of the Hungarian people. In this respect the songs are the most important as they are the most original of the people's compositions. The tales on the other hand are the least so, their subjects in almost all cases being identical with the well-known tales of other peoples, the peculiar handling of the subject and manner of telling the story being all that is distinctively Hungarian about them.

The amount of importance to be attached to the Christmas mysteries and Twelfth Night plays is very satisfactorily defined in a long explanatory note of M. Gyulai. He traces the course of development of the mysteries in the countries of Western Europe. He shows how from being a somewhat dramatic portion of divine service enacted about the altar by the clergy it became an imperfect drama, still retaining its liturgical character, performed outside the church by non-clerical actors. In its third stage of development the dramatic

elements of the mysteries developed themselves at the expense of the liturgical until the mystery itself became by gradual transition the profane drama. The veteran historian of Hungarian literature, M. Toldy, has maintained that the same process of development took place in Hungary. M. Gyulai, with that respect for recognized authority which is such a striking feature in Hungarian literary circles, does not directly controvert this view, but merely throws out as pertinent to the subject a few observations which will probably prove convincing to all non-Hungarian readers.

That the liturgical mystery existed in Hungary is not proved by any direct historical evidence; but two circumstances render it more than probable. In the first place the liturgy of the Latin Church in Hungary was the same as in other countries of mediæval Europe; in the second, the remains of the mysteries printed in the collection before us evidently prove their original liturgical character. But of the existence of the mystery drama, that is the mystery in its third stage of development, we have not only no historical evidence, but we have also no remains of such dramas handed down to us. Besides, M. Gyulai observes that even at the present day the Hungarian people do not show as much taste for dramatic performances as either the Latin or Teutonic nations; that the ceremonies of Magyar heathendom do not appear to have been so dramatic in their character as those of the Teutonic peoples; and that the heathenism of their ancestors has left scarcely any trace amongst the Magyars, after their conversion to Christianity. In mediæval, as in modern, Hungary the citizen class flourished to a less extent than in Western Europe. But it was just in the largest towns where the citizen class had most influence that the mystery attained its fullest development. Further it is to be observed that where the dramatic mystery flourished it was followed by a marked development of the modern Christian drama: in other words, the third period of the development of the mystery may be considered as a necessary consequence of the second. Now in the sixteenth and seventeenth centuries we find in Hungary only the didactic drama, a modification of the mediæval "morality," and that, too, imported partly by the Jesuits, partly by Protestant pastors who had studied in foreign universities. With regard to the earliest secular drama, "The Betrayal of Balassi Menyhárd," it seems by no means certain that it was ever intended for the stage, being rather a satire written in the form of a dialogue. The fact that the secular drama in Hungary did not stand in connection with the mystery is in itself sufficient proof that the dramatic mystery could not have flourished there as in the West of Europe. All the above considerations taken together point to the conclusion that the mystery in Hungary remained in its first stage, while in the West it had advanced into the second.

It is to be observed that all the liturgical mysteries that have come down to the present day have reference to Christmas or Epiphany. But several traditional anecdotes prove that similar mysteries were formerly played representing the Passion and Resurrection. To these latter, however, the peasantry seem not to have been so much attached, probably because they interfered with their labours in the fields, while those of Christmas and Epiphany fell in the winter season of enforced leisure. The specimens here preserved have naturally suffered a great amount of change since they were driven from the Church to take refuge amongst the people. They exhibit various forms, some simpler, some more artificial, the *naïveté* of the true peasant, and the pedantry of the village schoolmaster; in some only Catholic hymns occur, in others Protestant, in others again both. Here we find fragments of popular

songs, there verses from poets of the last century; sometimes the Latin words of the liturgy have remained, in others verses composed in the most modern Hungarian have been interpolated; often a comic effect has been sought by the introduction of Slave or Rouman words and phrases. But in spite of later corruptions the original compositions of the liturgical mysteries can be distinguished, agreeing in the main points with those of mediæval France and Germany.

Next to the mysteries some of the ballads have the greatest antiquarian interest, dating as a few of them do from the periods of Turkish invasion and the civil wars of the "*Kuruc* world." On the whole, however, the traditional poetry of the Hungarian people is in consideration of its extent not rich in historical or in genuine war songs; this has called forth expressions of surprise from critics who remember the proverbial "thousand years' struggle for existence." By way of explanation it is perhaps sufficient to refer to the fact that from 1711 to 1848 the struggle for existence, often very languid in its character, was maintained not in the battle-field, but in the debates of the Diet and the County assemblies; that the foreign wars of this period were generally dictated by the interest of the "German;" that there was no national army, while the Hungarian regiments had to some extent the character of penal institutions; that the gentry were extensively denationalized, and the traditions of the past were discouraged by the Government. To the fact that these influences had less effect in Transylvania than in Hungary Proper may be attributed the difference observed by M. Gyulai, between the Hungarian and the Transylvanian, especially Székely ballads in the collection, both as regards form and subject. The scenes in which the former are laid are for the most part cottages, lonely farms, or in the more exalted cases the fairyland of the popular tales; while the latter have a certain historical background, and relate to knights, castellans, or the so-called "free heyducks." And the difference of form may be considered to correspond to the difference of subject, in the Hungarian ballads the lyrical elements predominating, in the Transylvanian the epic. Thus the former are generally more modern in their prosody, and are written in rhymed stanzas, while the latter content themselves with the more primitive rhythm produced by the division of lines, alliteration, and a peculiar balance of the accent and the ideas.

This rhythm of the ideas is found produced in three ways: by means of opposition, accumulation, and parallelism.

The simplest form of opposition is where the beginning and end of each verse stand in contrast to each other, as in the instances cited by M. Gyulai:—

Lelekem a lelkednek	My soul to thy soul,
S mennyeekben vígadjon.	And let it rejoice in heaven,
A hercegné asszony	The lady duchess,
Pokolban gyuladjon.	Let her burn in hell.

And again:—

Kit mindig szerettem, jaj be távol estem,  
Kit mindig gyűlöltem annak rabja lettem.

Whom I always loved, alas! (from him) I became far distant.  
Whom I always hated, of him I became the slave.

But often the opposition is indicated by but one word in a repetition, as in the following passage:—

Dost thou make for me *any* coffin?  
I make, my rose, a *marble* coffin.  
Dost thou envelope it in *any* linen?  
I envelope it, my rose, in a *black* veil.  
Dost thou ornament it with *any* nails?  
I ornament it, my rose, with *gold and silver*.  
Dost thou carry me out with a *few* gypsies?  
I carry thee out, my rose, with *royal* princes.

Wilt thou presently ring a *triple peal*?  
 I will ring, my rose, *all the sixteen*.  
 Wilt thou escort me, my rose, *at least to the gate*?  
 I will escort thee, my rose, *to thy abiding resting-place*.

As specimens of what we have called accumulations we may cite :—

Hadst thou then not a *morsel of bread*?  
 A morsel of bread, a *cup of wine*,  
 That thou should'st not deliver me into the hands of the Turks?

And again :—

I already became weary of *arising in the morning*,  
 Of arising in the morning and *going out to the brook*,  
 Of going out to the brook and *washing the bloody clothes*.

The reader will observe that the repetition forms the first half of a verse, and the progression the second, the progression being often rather subjective than objective :—thus in the last quoted passage the brigand's wife dislikes getting up in the morning, shivers at the water's side, and is disgusted at her loathsome occupation.

Of parallelism the instances quoted are perhaps hardly so striking. For instance :—

Boriska, Boriska, *we have come for thy fair daughter*.  
 Into the hands of Turks *deliver thy fair daughter*.

Or again :—

We shall find it in the fair ruddy dawn,  
 In the fair ruddy dawn, in the clear day-break.

And again :—

For I have at home *my betrothed, my espoused*,  
*My faithful consort bound to me by a vow*.

The peculiar rhythm of thought which has been shown to characterize primitive Hungarian poetry is known to exist in the primitive poetry of other nations.

The songs that live in the mouths of the people may be divided into three classes : those that are of purely popular origin entirely uninfluenced by literature ; then those of semi-popular origin composed by half-educated, unknown persons living amongst the people, which the people have accepted generally with some amount of modification, but in which the influence of literature is still more or less discoverable ; and, lastly, the songs of recognized poets which have passed into the mouths of the people amongst whom they too, like those of the second class, often suffer some amount of change. \*The last class of songs has naturally been excluded from this collection.

To distinguish between the first and second class of songs is as easy in some cases as it is difficult in others. In some the intrusion of literary influence is so obvious that a single glance is sufficient to remove all doubt as to its existence. In some the idea and the form appear equally to owe their origin to literary study, and the language and tune are alone of really popular character. Again, in other cases the language betrays the education of the author, where we encounter expressions elegant and regular but devoid of force and originality, while words are employed in those particular shades of meaning which literary authorities have assigned them.

But still there are numerous instances in which the influence of literature has disguised itself with more or less success. In some songs single stanzas or lines are as unmistakeably popular in their origin as others are the reverse, and it becomes a moot question, for the most part incapable of solution, whether the author of the song took these popular elements from the people, or whether the latter themselves inserted them subsequently to its original composition. As M. Bartulus has observed in his report to the Kisfaludy Society respecting the collection of Hungarian melodies, a "folksong" is not composed once for all, but as it passes from mouth to mouth goes through a process of continual recension.

The surest test of the popular as distinguished from the semi-popular origin of a song is a peculiar expression of simplicity and directness, rather to be felt than defined, and therefore peculiarly difficult to imitate. Another test upon which M. Gyulai relies are certain forms too primitive to invite imitation, one of these is the rhythm of thought, and where this is most strictly observed we may be quite sure of the truly popular origin of the poem. One of the forms which this rhythm takes is that in which the whole song consists of a repetition of the same idea, with modifications gradually increasing its force or definiteness. The following Transylvanian love song may serve as an illustration :—

May God smite  
 The house of my beloved !  
 Not just the house,  
 The dwellers therein ;  
 Nor all of them,  
 Only ~~one~~ of them—  
 His own dear father :  
 For he tore away from me  
 His youngest son—  
 If he was his son—  
 He was my beloved :  
 If he was dear to him,  
 To me he was dearer !

Other primitive forms are those in which the same thought is repeated with slight modifications, the feeling or fancy being more or less elevated with each repetition till an unexpected turn of thought concludes the song. A third primitive form is that in which a certain condensed dramatic character is given to the song.

The simplicity and directness which constitute the surest test of the popular origin of a song arise from the substantial identity, nay unity, of the poet and his public. The literary poet necessarily addresses himself to an audience for whom he writes and whom he wishes to affect, and must therefore, however sparing of his words, explain in what character and with what reference to time and place he sings. But the people, singing to itself and for itself, instinctively understands all that is required for the explanation of a song, which can be a mere expression of a feeling, habitual or transient. At the same time, as observed above, there are songs in which corruption and interpolation have by a process of mutual plagiarism between the half-educated and wholly uneducated classes produced such an amalgam of popular and literary elements that it is impossible to assign to either of them the priority.

In like manner it is generally, not to say universally, impossible to discover which is the original version of songs of purely popular origin. A folksong as it passes from mouth to mouth suffers continual change as often for the better as for the worse. In many cases, too, a sort of spurious song is formed by piecing together verses of different songs sung to one common tune. They are to be found even in the best collections, e.g., in those of Erdélyi and Kriza, but the editors of the one before us have made a point of excluding all such accidental accumulations of verses.

ARTHUR J. PATTERSON.

Koberstein's History of German Literature. [*Grundriss der Geschichte der deutschen Nationalliteratur.*] By Augustus Koberstein. Vols. I., II. Fifth edition, revised by Karl Bartsch. Leipzig. 1872.

THE high value of this work has long been recognized by the learned and the general public. It is the first real approach to an exhaustive attempt to depict the historical development of German poetry and rhetoric from a purely scientific point of view, to characterize objectively and realistically the vast intellectual wealth of the German people, so far as it can lay claim to artistic value, in reference to its growth, its significance, and its outward influence, and

this, so far as possible, in the light of contemporary feeling and thought. The author does not aim at giving an independent subjective judgment, or at explaining his subject from within, but he refrains, in compensation, from all those elaborate phrases in which literary historians are apt to envelop the real kernel of the matter, while they substitute, as Faust says, for the spirit of the age "der Herren eigenen Geist in dem die Zeiten sich bespiegeln." Koberstein offers nothing but the collective results obtained by severe and conscientious research expressed in the most concise form. Those who do not like to receive them upon trust, who wish to follow the process by which they were reached and to form their own opinion from the original sources, will find in the innumerable footnotes to the text an amount of bibliographical information such as is scarcely to be met with in any other work of the kind. Indefatigable industry and astonishingly wide reading have brought together everything that has been written upon every controverted point either by specialists or by cultivated laymen down to the smallest newspaper articles, reviews, or occasional critical remarks; no point of view is neglected that the works of the authors themselves, or other written authorities could suggest. It must, however, be admitted that the really oppressive abundance of these notes often interferes with the general view of the whole, and that even the sifting process carefully carried out by the present editor hardly goes far enough to remedy the evil. The new edition, indeed, has one great point of superiority over its predecessors. In these the historical and biographical dates and the various literary criticisms were almost exclusively incorporated in the notes, whereas the text is now recast so as to include them. Another disproportion has also been partially removed; whereas formerly the sixth period, including the latest times, occupied at least three times as much space as the five earlier ones together, the latter now occupy at least two-fifths of the whole, having received material additions, sometimes amounting to reconstruction, by the pen of Prof. Bartsch, as, for instance, the section upon the Nibelungenlied shows.

The line of demarcation in the principal sections has been criticized with some reason, and one point in particular produces a strange impression: contrary to the natural and usual method, the occurrence which had the deepest effect in revolutionizing literary and other relations, the German Reformation, is not taken as the starting point of an epoch, but is included in the fourth period, made to reach from the middle of the fourteenth to the end of the sixteenth century. But this is after all only a matter of external arrangement, concerning which we need not dispute with the lamented author; the other brilliant qualities of his work and the admirable disposition of his bulky and confused materials are a more than sufficient compensation.

Each period is introduced by a general sketch of the political, social, moral, ecclesiastical, and scientific circumstances marking its duration, and their relation to the contemporary literary development. Then follows an account of the language and versification of the period in question, which is based upon the most minute and detailed inquiries and gives an excellent review of the special works bearing on the subject. Lastly the poetry itself is considered, with its separate kinds and forms and its gradual development and increasing cultivation. While in the first period, from the earliest days of German history to the middle of the fourth century (vol. i., 7-15), the origin of the Germans, their early culture, their language and poetry are represented in brief outline, the second—from the middle of the tenth century to the beginning of the twelfth (pp. 16-83)—discloses a vivid picture of the effects on German culture and poetry produced by the migration of the nations and the introduc-

tion of Christianity. The merits of Charles the Great are placed in the proper light; the prime and decay of the monastic and cathedral schools, and whatever else had prominent influence on the development of the national literature, are arranged into an artistic framework, against which we see in clearer relief the shape of the different classes of poetical composition—the popular poetry as well as the ecclesiastical and learned literature of the vulgar tongue. The two other periods contained in the first volume are treated in an equally attractive manner; in the third, from the beginning of the twelfth till towards the middle of the fourteenth century (pp. 84-259), the courtly narrative poetry, the Minnesang, and the great popular epics, the Nibelungenlied, Kudrun, &c., meet especially with thorough discussion; the fourth, from the middle of the fourteenth to the end of the sixteenth century, include the time of the minstrels, the beginnings of dramatic poetry, the revival of classical studies, and a rich prose literature in the field of romance, narrative, fable, legend, and satire. This is the close of the first part, dealing with the heathen and mediæval periods. The fifth division, from the beginning of the seventeenth to the second quarter of the eighteenth century, occupying the whole of the second volume, brings us to modern times, at the head of which Martin Opitz appears as creator and founder.

These few indications touching the form and substance of the two volumes hitherto published may suffice to give an approximate idea of the rich materials worked up in them, and to recommend them to the diligent study of all who are anxious to become thoroughly acquainted with the early literature of Germany. We congratulate Prof. Bartsch on this last production of his uninterrupted industry, and indulge ourselves in the hope of welcoming before long the remaining three volumes, which will include the most glorious period of German poetry, its second classical age. H. ETHÉ.

### Notes and Intelligence.

In the *Révue des deux Mondes* (April 1) Lord<sup>1</sup> Dalling's *Life of Lord Palmerston* is reviewed by the Comte de Jarnac, from the point of view of an Orleanist diplomat, whose respect for Lord Palmerston's ability in negotiation is perhaps intensified, but not made more affectionate, by personal recollections of some passages of decidedly sharp diplomatic practice of the kind by which the Foreign Office under his rule was wont to uphold the national prestige. A paper on *La Physiologie de la Mort*, by M. Fernand Papillon, gives a popular account of the distinction between real and apparent death, and the separate and gradual dissolution of the organic and the animal life; but the conclusion is more popular than scientifically precise or intelligible.

*Witchcraft and Non-Christian Religions*, by A. C. Lyall (*Fortnightly Review*), is an attempt to show, chiefly from experience amongst the more barbarous tribes of India, that the practice of witchcraft is generally independent of the proper local superstition, and is more like rudimentary science than debased religion. The sorcerer relies upon general agencies supposed to be natural though mysterious, and his powers—imposture eked out with a little natural magic and luck—excite the jealousy of the established priesthoods, whose gods are liable to be discredited by such rivalry. A paper on *Ghosts and Goblins*, in the *Cornhill Magazine*, calls attention to a very simple source of superstitious misbelief which has hardly received as much attention as it deserves—viz., the misinterpretation of the senses, or mere inaccuracy of perception, both of which are much commoner than optical delusion, or actual hallucination, while a chance coincidence may make them appear as mysterious.

A volume of historical interest, and containing important details concerning Prussian diplomacy of twenty years ago, has

just appeared at Leipzig, under the title *Aus dem Briefwechsel Friedrich Wilhelms IV. mit Bunsen*. It is edited by Ranke, who accompanies the text with a running commentary of supplementary notes.

Some curious old musical MSS., including the Gospel of St. John set to music, apparently of the fourteenth century, and in good preservation, have been discovered at Harderwik, in Holland.

M. Ortolan, professor of criminal law at Paris, and author of the well-known work on the Institutes of Justinian, died on the 28th ult., at the age of 71.

In the *Contemporary Review* Mr. W. R. Greg discusses, with special reference to the *History of Joshua Davidson*, the extent to which it is desirable, or possible, at the present day to act literally upon the ethical precepts contained in the Gospels, and decides that non-resistance, almsgiving, and carelessness of the morrow are mischievous, though the spirit in which they were formerly recommended or practised continues as desirable as ever. He points out that the political criticisms in *Joshua Davidson* are both less Christian and less just than the portions bearing on social prejudices and shortcomings.

## Art and Archaeology.

**The Early Flemish Painters.** Notices of their Lives and Works. By J. A. Crowe and C. B. Cavalcaselle. Second Edition. 1872. Murray.

ALTHOUGH put forward as a new edition only, this may almost be considered as a new work, so entirely has it been re-written. The increased interest that is now felt in the subject will doubtless ensure it many more readers than when it first appeared in 1857, and all who know the careful study and scientific observation that the authors bring to bear upon their work will be anxious to learn the result of their latest labours in the field of Flemish art.

The art of the Netherlands exhibits several distinct phases. It is only with the first of these phases, the religious but not ascetic art of the school of Bruges, that MM. Crowe-Cavalcaselle deal; they do not even trace the decadence of the religious spirit and the gradual Italianization of early Flemish painting in the school of Antwerp, a school derived from that of Bruges, but soon departing from its early faith.

The school of Bruges is remarkable as having developed, at a time when Italy was already asserting her predominance, a purely national art. While the painters of Florence, Paolo Uccello, Masolino, Masaccio, and others, were studying the scientific principles of their art, the painters of Bruges were experimenting in the mysteries of colour; for colour from the first to the last in the Netherlands was more loved than form. It is not even yet perfectly clear in what the famed discovery of the Van Eycks consisted, but in some way or another their method revolutionized the whole practice of painting. No fresh light is thrown on this subject in the present work. The authors accept Sir Charles Eastlake's conclusions rather than those of Count Secco Suardi, whose theory is that Van Eyck substituted the fluid oils obtained from linseed and nuts *without boiling* for the more viscous boiled oils previously used.

But it is not the discovery of a better medium, it is the individual genius of the great founders of the school of Bruges that gives that school its claim to distinction and makes the scanty knowledge we have of its history interesting. It is surprising that our knowledge should still remain so scanty, considering the careful investigation to which the archives of the Netherlands have recently been submitted by a number of distinguished archæologists and

historians, all working with the same object of throwing light on the early history of their country; yet even when, as in the volume before us, the results of all their researches in the domain of art have been added together we find it does not after all amount to very much. Since the first appearance of their history, the authors tell us, "criticism and inquiry have enlarged our knowledge of the schools of the Netherlands. Artists whose identity was not established are now familiar, records which seemed to have been lost have been found again, and pictures which were thought to have perished are restored to us." It were strange indeed if such an amount of research as has been brought to bear on this subject had proved entirely fruitless; still it must be confessed we do not find quite as many "discoveries" as we anticipated.

Hubert Van Eyck, the great patriarch of Flemish painting, remains the same, grave, unknown figure as heretofore. It is surmised, certainly, that he may have held some high position in the household of the Comte de Charolois, afterwards Philippe le Bon, at Ghent, for at the death of Philippe's first wife, Michelle of France, sister to the Duke of Orleans who murdered Philippe's father, Jean Sans Peur, at the bridge of Montereau, it was considered a grateful tribute to her memory to grant the freedom of the guild at Ghent to "her favourite painters," the two Van Eycks.

The entry to this effect in the Ghent register is not however without "suspicion of interpolation." With the exception of the grand figures of the upper portion of the altar-piece of St. Bavon, no certainly authentic work has been found of a master who was once "high in honour," and of whom his brother, the better known Jan, recorded "major quo nemo repertus."

In Jan's history the only important fact recently gained is that he spent two years at the Hague in the service of the reckless Jean Sans Pitié, Bishop of Liège. In the list of knights, officers, minstrels, and servants who formed part of the usurping Bishop's court at the Hague, Jan is named as *myns genadichs heeren scilder*—our gracious Lord's painter—and the archives of Holland show that he was in receipt of a regular salary for nearly two years. This was, of course, before he entered the service of Philippe le Bon.

Of Hugo Van der Goes we learn from a passage in a chronicle written at Rouge Cloître in 1500 by Gaspar Offhuys, a fellow novice in that monastery with Hugo, that "he was so celebrated as a painter that it was said his like could not be found even beyond the Alps. . . . Numbers of people of rank, the Archduke Maximilian amongst the rest, constantly came to see him and admire his pictures; and through their intercession he obtained permission to frequent the guest-room and join the strangers' dinner. No doubt he was subject to fits of melancholy, often thinking how he should complete the mass of works which he had to do; but what did him most harm was his copious indulgence in wine at the strangers' dinner-table. Five or six years after he professed he went with his brother Nicholas and others to Cologne, and on his return was seized with such a hot fit that but for his friends he would have laid violent hands on himself. He was brought back with difficulty to Brussels, and there the prior who had been sent for endeavoured to soothe his passion with music; but for a long time nothing would quiet him, and he laboured long under the belief that he 'was a son of perdition.' At last he improved, and of his own accord gave up attending in the refectory, and took his meals with the lay brothers." Perhaps the writer may have been a little jealous of his brother novice being invited to the strangers' dinner-table, but it is not improbable that we have here the secret of poor Hugo's "melancholy."

A few facts are added to those already known concerning Roger Van der Weyden and Memling, but no such interesting contemporary comment as this of the novice Offhuys has been found.

The much disputed altar-piece of the "Last Judgment" at Dantzic, which has been assigned to Van Eyck, Van der Goes, Albert Van Ouwater, and lastly by Professor Hotho to Memling, is now reckoned by MM. Crowe-Cavalcasse among the latter's authentic works. It was not mentioned, or at all events not assigned to Memling, in the first edition, but we have now an interesting history of it from the *Dantsiger Chronik*, and an outline drawing, the same as that in Kugler and Waagen's Handbook (*Flemish Schools*).

One entirely new name has recently been added to the annals of Flemish art, that of Gheerardt Davidt, to whom there is nearly a whole chapter devoted in the present edition. His paintings were known before, and were considered to be the work of one man, but to our countryman Mr. Weale belongs the honour of having rescued the artist from the lists of the "unknown." It appears that this "Gheerardt Jans fs. [filius] Davidt of Oudewater" came to Bruges in 1483, paid the dues of the guild as a stranger in 1484, became fourth *vinder* of the guild in 1488, first *vinder* in 1495 and 1498, and dean in 1501; that he married Cornelia Cnoop, daughter of a goldsmith, and was, there is every reason to believe, a worthy Flemish master, and follower of the Van Eycks. His principal existing work is a "Baptism of Christ" in the Bruges gallery.

These are about the most important of the new facts contained in this edition of the *Early Flemish Painters*; but the whole work, as before stated, has been rewritten, the matter thoroughly sifted, and the facts verified.

The thanks of all students of art history are due to its authors for the patient labour they have bestowed upon their work.

M. M. HEATON.

#### THE DUDLEY GALLERY.

IN a modern picture exhibition of small and unremarkable works, such as, without disrespect, we may consider that of the Dudley Gallery to be, it is especially true that, as Shelley remarks of all picture exhibitions, "we see three hundred pictures we forget for one we remember."

The impressions produced on the mind by such works are so slight that they are easily effaced, and although while in the Gallery we are able to note that some are more deserving of praise than others, no sooner are we away than they all alike lose themselves in the prevailing fog.

By far the greater number of the paintings in the Dudley Gallery are landscapes. Almost all show careful study of nature, an artistic appreciation of the varied aspects of sea and sky, and a faithful endeavour to reproduce observed effects. By this means pleasant and truthful little pictures are produced, but unless the artist gives us something more than all this—something added to this—we are apt to feel uninterested in his work. It is the artist's mind that we miss in such reproductions—the artist's own thought about the nature he copies; without this we might almost as well have a photograph. Mind, it must be owned, struck us as being altogether left out by most of the landscape artists of the Dudley; nevertheless there were many excellent landscapes whose faithfulness most people no doubt would prefer to what they would call the idealisation of the scene by the artist's own imagination. Of these we may mention H. Moore's "On the Goodwins" (83); "A Herring Fleet in the Sound of Kilbannan," by H. Macculum (32); "St. Martin's Summer," by the same (96); "Morning—Farmyard, Tynemouth," by C. Richardson (339); "Near Rotterdam," by Joseph Knight (448); "At Stobhall, Perthshire," by W. B. Scott (114); "Barges on the Thames," by Madame Bodichon (455);

"Bruges," by T. C. Farrer (323). Several others besides these gave us pleasure at the exhibition, but at the distance of a week from our visit we cannot call up any distinct recollection of them.

Of the few figure subjects Mr. Burne Jones's "Hesperides" and "Love among the Ruins" (179, 482) easily fix themselves in the memory. It is difficult in fact to escape being haunted by those wearied, pallid daughters of Hesperus, who, as they dance round the tree, look more like galvanized corpses than nymphs of Greek fable. There is a rhythmic poetry, however, in this, as in most of Mr. Burne Jones's works, that has a peculiar charm of its own. "Love among the Ruins" is marked by the same hopeless melancholy. Mr. Poynter's sketch in fresco of "The Gardeners" (515) is an excellent example of decorative art in the simple but imposing classic style. It might have decorated a Greek Lesche. Of portraits may be mentioned Mr. Poynter's "Portrait of Mrs. J. P. Heseltine" (88)—a lady dressed in a blue and white china plate, and a charming portrait of a good little girl earning an orange, by J. C. Moore (272).

#### ART IN PARIS.

SINCE order was restored the French Government have been very active in all matters connected with art, to atone for the destructions of the Commune.

At the Louvre the Salle d'Apollon has been restored, the beautiful Gobelin tapestry portraits repaired. Three new salles have been opened, and the galleries extending the whole length of the building, parallel to the Seine, as far as the Pavillon de Flore are to be filled with paintings. Many statues have been removed from the gardens of the Tuileries and Versailles and placed in the sculpture galleries to keep them protected from the weather. The "Venus" of Milo again stands there in fresh beauty, unhurt by her entombment, and the two plaster casts taken, the one in her present position, supposed to be the original, and the other inclined, as given by Bernard Lange, stand side by side in the Salle des Moulages, so that the two attitudes may be compared. The Egyptian Museum has just made a most valuable acquisition—a group of three figures, Osiris, Isis, and Horus, of about four inches in height, of solid gold: Isis with her cow's horns and disc; Horus, hawk-headed, wearing the "pschent" or Egyptian crown, sits between his mother and Osiris, who stands on the other side holding the crook and whip. On the pedestal are legends of Osorkon II., of the twenty-second dynasty. This little group was purchased by the French Government, at the cost of £1,000, out of the collection of M. Dimitrio, of Alexandria. The place where it was found is unknown, nor has M. Aug. Mariette, director of the excavations for the Pasha, been able to gather any information respecting it. This is what generally occurs as regards objects of gold. The Arabs sell them without making known their derivation, as it is their interest to keep silent on the subject. The salle containing the Musée des Souverains, dispersed in such Gothic taste, has not been re-opened.

In the Louvre, Pavillon Jean Goujon, the last sale of the "moblier" of the imperial palaces has just taken place. The china and glass with the N. and imperial crown sold at high prices, purchased chiefly by the Americans; but together with these was included a quantity of stags' horns which formed the decoration of the imperial hunting boxes. Each set of antlers bore the date of the hunt at Fontainebleau or Compiègne at which the stag had been killed. By a strange caprice of fortune, on the head of a magnificent seven-year-old stag was inscribed, "Tué à Compiègne, aux étangs de Saint-Pierre. Présent: S.M. le roi de Prusse."

The National Assembly has voted 200,000 francs for the purchase of the rare collection of the coins of Gaul, of M. de Saulcy, which has been the work of twenty years' collecting. It is said the British Museum offered for it 300,000 francs, but that M. de Saulcy patriotically preferred reserving it for France, though at a lower sum. This collection is now in the National Library, and comprises about 7,000 pieces, among which are 1,000 in gold, and forms an invaluable monetary series of the coins of Gaul. It probably will eventually be transferred to the Gallo Museum at St. Germain.

The Gobelins are now under the direction of M. Alfred Darcel, late keeper of the ceramic collection at the Louvre. When the

Communists set fire to the building the greater part of its masterpieces were burned. Out of ninety tapestries of priceless value seventy-five were destroyed, copies from Le Brun, Boucher, Coypel, Vanloo, Audry, Mignard, and others. The part of the building necessary for continuing the manufacture has been rebuilt, and some beautiful works are now in progress for the new opera-house, which is proceeding slowly. They say Carpeaux' objectionable Bacchanal group will be removed into the interior of the building.

The Musée de Cluny was unscathed. Such a disgrace its fine collection of pottery should be so incorrectly and scantily described, probably no more than the sale catalogue description of the pieces when purchased. Why not a catalogue raisonné like that excellent one of the Louvre? But in both museums a descriptive ticket should be affixed to each specimen, as is practised at South Kensington and in a less degree at Sèvres. No steps have been yet taken to transfer the ceramic collection of this last place to the new building. M. Champfleury now has the office of the lamented and learned Riocreux.

Soon will be opened at the Palais de l'Industrie the Musée Européen of M. Jules Simon, Government having ordered copies to be made by eminent artists of the most celebrated works of the great painters of all nations. Of these about a hundred and fifty have been finished.

The designs have been made for the new Hôtel de Ville, which now, in its beautiful desolation, recalls strongly, site always excepted, the ruins of Heidelberg. The municipal authorities are actively working at making the Hôtel de Carnavalet, the residence of Mme. De Sevigné, fit for the reception of the city antiquities and what remains of its library. The floors of the corridors have been taken up and replaced with red tiles, picked out with blue and yellow. The old glazings of the windows have been preserved, but all now is confusion, the panelling of the walls taken down, the cabinet d'étude in which Sevigné penned her letters, the chambre bleue, the summer bedroom with its fine chimney-piece, are all bouleversé. The beautiful façade and statues of Jean Goujon are under restoration. The famed sycamore tree in the garden has been cut down; and the antiquities are not yet transferred to the building, with the exception of a number of skeletons embedded in plaster, found in the excavations made at Mont Ste. Geneviève, when a Roman circus was discovered, but the ground being covered with buildings the purchase of it was impracticable.

#### NOTES ON ART.

The *Zeitschrift für bildende Kunst* of March 21 opens with a long biographical and critical notice of Anselm Feuerbach by Fr. Pecht. Feuerbach is one of the few living artists in Germany who still continue to draw their inspiration from the antique. In many respects he may be considered as the successor to Carstens and Ingres, but his style differs considerably from theirs. His paintings are cold in feeling as well as in colour, and like most of the masters who aspire to a grand style he too often sacrifices originality to what he considers the claims of high art. Haydon made the same mistake. Anselm Feuerbach was born in 1829, studied first at the Düsseldorf Academy under Schadow, and afterwards in Italy. The "Death of Pietro Aretino," exhibited in 1853, brought him first into notice. This was followed in 1857 by "Dante with Noble Women in Ravenna," and somewhat later by "Petrarch seeing Laura for the first time in Church." To the Munich Exhibition of 1869 he contributed an important painting representing a classic symposium, which was criticised as appearing among the more gaudy works in the exhibition "like an iceberg from the Arctic regions." His more recent works are "Orpheus and Eurydice," "Medea," and a "Judgment of Paris," conceived in a strictly classic spirit. The article is illustrated by an etching by Professor Raab of a Pietà now in the possession of Freiherr von Schack, and a woodcut of the "Iphigenia" of the Stuttgart Gallery, the best known perhaps of Feuerbach's works.

A drawing by Holbein, executed with extreme care and of exquisite finish, was recently sold at the Hôtel Drouot for the enormous sum of 7,050 frs. The auctioneer was about to knock it down to a gentleman who it was understood was one of the keepers of the Louvre collection for 700 frs., when

M. Suermondt entered into competition and finally succeeded in carrying it off from the Louvre by purchasing it at the price above mentioned. Dr. Woltmann, the German biographer of Holbein, imagines that this drawing, which is of a man's head, three-quarter view, bears some resemblance to the portrait of Charles Wingfield in the Windsor collection.

A young Russian engraver, N. Massaloff, has done good service to art by reproducing by means of etching the most celebrated works of the still but little known gallery of the Hermitage, at St. Petersburg. In two magnificent folio albums Herr Massaloff gives us first, forty fine etchings of Les Rembrandt de l'Ermitage Impérial de Saint Petersburg, and secondly, in Les chefs d'œuvre de l'Ermitage Impérial de Saint Petersburg, twenty etchings of the works of other celebrated masters. This latter album is principally devoted to the Dutch genre school, but Titian's "Danaë" and one or two other Italian works have found their way into it. It promises to be only the first of a series, so that we may hope in time to have satisfactory reproductions of all the great works stored up in the northern capital. Hitherto they have been known only by very poor engravings and lithographs. Herr Massaloff has a complete mastery over the technic of his art; his etchings are spirited and powerful and well preserve the character of the original, but they have not the delicacy that distinguishes the works of the German engraver W. Unger, who has in a similar manner reproduced the chefs d'œuvre of many of the less known galleries of Germany.

The annual distribution of prizes to the art schools throughout the kingdom took place on the 26th of March at Burlington House, their Royal Highnesses the Prince and Princess of Wales being present. Out of the 120 art schools that entered into competition the Female School of Art in Queen's-square, Bloomsbury, carried off the most prizes. In that school one out of every 22 students gained an award, whereas in the Edinburgh school one out of 26, in the Manchester school one out of 36, and in the Birmingham school only one out of 62 received a prize. The Committee of Council on Education has therefore placed the name of Miss Gann, the superintendent of the school in Queen-square, first on the list of premiums awarded to the heads of the art schools.

The art article in a recent number of *Im neuen Reich* is entirely taken up with a stricture on the management and arrangements of the Berlin Museum. The writer, R. Dohme, considers that an institution that appears in the supplement to the budget for 200,000 thalers ought to have a wider influence and to be more effective in its working.

A public subscription has been opened in Italy for the purpose of raising a monument to Titian on the occasion of the fourth centenary of his birth. This will not be, however, until 1877. Italy has certainly not been in too great a hurry to pay this tribute to the memory of her "supreme colourist."

The National Library of Florence, says the *Nazione*, in accordance with a clause in a treaty concluded with Austria-Hungary, has been obliged to restore to the heirs of Duke Leopold II. of Tuscany a richly illuminated manuscript on vellum of which it has long been possessed. The manuscript is dated 1588, and contains miniatures of the German school and very beautiful initial letters; it has, moreover, a family interest, in that it is said to contain the genealogy of the house of Hapsburg-Lorraine, a genealogy including nearly a hundred saints. All the other manuscripts acquired from the Ducal collection are allowed to remain in the National Library on condition that they shall not be removed from Florence.

The *Mémorial Diplomatique* states that the Church of Abongosch in Palestine on the route from Jaffa to Jerusalem has been given by the Porte to the French Government. This building is of interest as dating from the time of the Crusades. It is greatly in ruins, but it is hoped that it may now be preserved if not restored.

Dr. Willshire, who was for many years a distinguished London physician, but who suddenly in the midst of his career

renounced medicine for the sake of art, is, we hear, engaged upon a small work intended to be introductory to the study and collection of old prints. Dr. Willshire has been long known as a devoted print collector.

One of the most gifted of the younger school of Scandinavian painters, August Schneider, has committed suicide at Antwerp. His death will be a blow to Northern art. He was just engaged in illustrating Asbjørnsen's famous Folk-stories.

A new court will shortly be opened at the South Kensington Museum. It will be entirely devoted to reproductions of plastic works, and will be especially valuable to art students, for we hear that a series of casts of works, dating from the earliest ages of sculpture to the time of its fullest development, will be arranged in historical order along the galleries for their especial use.

A loan exhibition of decorative art needlework made before 1809 will likewise prove an additional attraction during the coming summer to the South Kensington Museum.

In the *Zeitschrift für bildende Kunst* G. Gutenberg continues his notice of the Bethnal Green Museum, criticising especially the paintings of the Spanish school.

We have heard from Rome that Storey, the American sculptor, will not send his great statue of "Jerusalem Fallen" to London, being dissatisfied with the manner in which sculpture is exhibited at the Royal Academy. He might, however, surely afford Londoners a view of his work before sending it off to America, even if he does not choose to honour the Royal Academy with it.

It is said in Paris that American artists will be in great force in the forthcoming Salon. Bridgeman, who made a great success last year, now sends a Spanish subject. Great discontent prevails among artists this year, however, because the Government has restricted the space usually allotted to them in the Palais de l'Industrie in order to make room for the projected gallery of copies from all the great collections of Europe.

Gustave Doré sends to the forthcoming Salon a painting of the Crucifixion, "Jour des Ténèbres," a subject well suited to his weird and poetic treatment. This artist we hear is studying Shakespeare with a view to illustration. He intends bringing out one play at a time.

The *Révue des deux Mondes* of the 15th of March contains an important article, entitled *L'Archéologie et l'Art*, by Henri Delaborde. M. Beulé's recent work, *Fouilles et Découvertes*, and the exhibition mentioned in a previous number of the works of the late Léon Vandoeyer at the École des Beaux-Arts, form the *raison d'être* of the article, but it is more than a mere critique.

On the 24th of March, and the four following days, Messrs. Christie, Manson, and Woods sold the first portion of the impressions from plates after Turner's works that had remained in the artist's possession; amongst others some etchings from unpublished plates of the *Liber Studiorum*. Details of this sale and the prices realized have been given in so many journals that we do not think it necessary to repeat them. The second portion of the Turner collection will be sold on 23rd inst. and the two following days.

The result of the controversy which has been carried on in the *Times* concerning the "Yarmouth Water Frolic," belonging to Prof. Selwyn, and exhibited during the winter at the Royal Academy, tends, as far as we can judge, to prove that the picture is by the younger and not by the elder Crome. Critics, however, will no doubt still continue to find the question sufficiently unsettled for them to enjoy the pleasure of disagreeing upon it.

The new descriptive and historical catalogue of the Madrid Museum, prepared by Don Pedro de Madrazo, gives a very full and, on the whole, correct account of the works of the great Spanish gallery. It contains many new and interesting

particulars as to the origin of the pictures, and their authorship is assigned with considerable judgment. Only the first part is as yet published, comprising the Spanish and Italian schools, but we may hope that the German, Flemish, and Dutch schools will soon follow. The pictures are numbered afresh in the new catalogue, but it is characteristic of Spanish dilatoriness that the change carried out in the catalogue has not yet been effected in the gallery itself, so that a valuable work is made comparatively useless. The usefulness of the work is also retarded by its being in Spanish. A French translation is much needed.

For some time it was doubtful whether the German schools of Düsseldorf, Berlin, Dresden, and Munich would be represented at the forthcoming exhibition at Vienna, for it was discovered at the beginning of the year that a treaty had been made between Baron Schwarz, the general director of the exhibition, and the representatives of French art, securing to France and Austria the most important positions in the new building, a very inadequate space and inferior positions being left for Germany, Great Britain, and Italy. The Düsseldorf artists protested energetically. Professor Hoff was very active. Meetings were also held at Berlin, at which all the schools were represented, and these meetings came at last to the resolution that Germany would send no picture to the exhibition unless Baron Schwarz altered his plans. The Austrian artists met subsequently at Vienna, and agreed with their German colleagues. The result has been that Baron Schwarz has yielded, and though it is not yet known what arrangements are made, German artists are satisfied and intend to exhibit. The reason for favouring France beyond other nations by conceding to her half of the entire space in the exhibition is stated to have been that the French Government had promised to forward pictures from all its galleries, including that of the Luxembourg. It was certainly desirable that the collection of masterpieces from Paris should be as large as possible; but it was not too much to ask that other nations should obtain space according to their wants, and this had not been done at all.

Professor Andreas Müller is busy restoring the large and interesting panel by Rubens representing the "Assumption of the Virgin" which adorns the gallery of Düsseldorf. He is doing his work with great care and precision, and not before it was wanted. It has never been stated from whence this picture came; but it is now discovered to have been purchased at the beginning of the eighteenth century by Johann Wilhelm, Elector of the Palatinate, and carried from Brussels to Düsseldorf on the shoulders of a detachment of grenadiers. The picture, one of the finest and largest of those that Rubens executed for the Belgian capital, stood originally over the high altar of the church of Notre Dame de la Chapelle at Brussels, and was sold after the French bombardment of 1693 for the sake of raising funds for the church's repair. It was presented to Notre Dame de la Chapelle by the Archduke Albert in 1614, and had previously been given as a present by Rubens to the Archduke's wife, Isabella Clara Eugenie, regent of the Netherlands.

The collection of antiquities which Sig. Castellani offers for sale to the British Museum has just received an addition of very great importance in the shape of (1) a bronze head of Aphrodite in extremely grand Greek style, and (2) an Etruscan sarcophagus sculptured with low flat reliefs of the greatest interest both for their fine archaic style and for the variety of the figures and actions.

## Physical Science.

**The Physical Effects of Forest upon Atmosphere and Soil.** [*Die physikalischen Einwirkungen des Waldes auf Luft und Boden, und seine klimatologische und hygienische Bedeutung, begründet durch die Beobachtungen der Förstl. Meteorologischen Stationen in Bayern.*] Dr. Ernst Ebermayer. Aschaffenburg: Krebs.

"THE welfare and the progress of a country depend to a certain extent on the amount of forest which it contains." Such a statement appears strange enough to us here at home, but its truth has at last been recognized at the India Office, by the foundation of a forest department, the cadets of which have been sent for training to the continental schools of forestry. The present volume is the outcome of the first five years' results obtained at the stations in Bavaria established under the superintendence of Prof. Ebermayer, of the Forest School of Aschaffenburg.

Many of the statements in the book depend on the observations of only three years, or even of a single year, but our author states his conviction that the main features of the subject can be elicited with sufficient accuracy for each station in a period of observation as short as that mentioned, and that the instruments can then with advantage be removed to a fresh station.

It must be remembered that the difficulties of the observations are very exceptional, as the mounting a ladder to read a thermometer in the top of a tree is not an agreeable duty to perform in all weathers, and so too great a tax must not be laid upon the officials to whom the instruments are entrusted.

The subjects investigated in the open country are, speaking generally, temperature in shade and sun, earth temperature, hygrometry, rainfall and evaporation. To these are added, in the forest, observations made in the head of the tree and on the temperature of the heart of the tree itself at various heights.

The first stations were established in 1867, and the total number in Bavaria is seven, distributed over the country. To these is added one in Bohemia on the property of a nobleman. The outfit of each station cost about £40, and the yearly cost of maintenance is one-half that sum. Some of the apparatus used deserves special notice, especially the vaporimeters for open water surfaces and for soil, and the arrangements for determining the amount of infiltrated water.

The subject is, comparatively speaking, so new and the variety of observations so great that the author for the most part contents himself with simply enumerating his results without attempting to deal with the subject as a whole. We shall therefore confine our remarks to an account of some of the more important subjects touched upon in the volume.

Earth Temperature comes first, as being the most important element for vegetable life. It is found at the various depths, 0—4 feet, to be lower, to the extent of twenty-one per cent., on the mean of the year, in the forest than in the

open, and this is pre-eminently the case in spring and summer, while in winter the difference is scarcely traceable. This shows us that the effect of clearings is mainly felt in summer, and that it is greater the warmer is the climate. Diurnal range is felt only to the depth of three feet, and it is materially diminished by the presence of forest. The annual range of temperature is less in the forest than outside it, but the periods of the two phenomena do not agree very closely.

The effect of wood on Air Temperature is similar to that just described, but the extent of the influence is only about half that exerted on earth temperature: the differences between the temperature above and underground thereby produced are of great importance as affecting the aëration of the soil, and thereby the nutrition of the roots. The observations as regards height show furthermore that the temperature rises with the height at least up to the level of thirty or forty feet. When we remember that the diurnal range is reduced by the presence of wood we see how an alternating vertical circulation, like that assigned as a cause for land and sea breezes, is set on foot, the existence of which, as our author amusingly states, may be proved by watching the smoke of a cigar.

The tendency of forests is found to be to moderate the extremes of temperature, and so to render the climate less severe. This is a direct contradiction to the popular idea that the cutting away of our forests has made our climate less extreme than it used to be.

The observations on Tree Temperature are very valuable, as by them we are able to determine far more simply than by any other means the total amount of heat required by each tree for its development. These experiments also throw great light on the causes which regulate the flow of the sap.

Bequerel's idea that trees warm the air is distinctly controverted by the results under discussion, which show that the temperature of the trees themselves is generally below that of the air.

In the winter the trees are colder than the soil, and in summer warmer: hence we see that the main seat of activity is in the roots in winter and in the branches in summer.

As concerns Vapour Prof. Ebermayer finds that the existence of timber produces no difference in the absolute quantity present in the air, but that owing to the depression of temperature the Fraction of Saturation is raised by the forest. Evaporation from a free water surface is about sixty-four per cent. less in the forest than in the open, and moreover it is far more ruled by the motion of the air than by the temperature. Hence we see the importance to young plantations which are likely to suffer from drought of leaving belts of trees to shelter them. Anything which breaks the force of the wind retains moisture in the soil.

The evaporation from the soil is, however, a very different thing from that from a free water surface, and in considering it we arrive at the valuable result that the brushwood, leaves, &c., which cover the ground exert quite as great an influence in retarding it as the forest itself.

It is found that for every hundred cubic inches of water evaporated from the soil, in the open, the ground in a forest, cleared of brushwood, &c., gives off only thirty-eight, and the uncleared ground, in its natural condition, gives off only fifteen cubic inches. Hence we see how immediately the water supply depends on the wood, and the fact confirms the old observation that in new and thriving settlements the springs dry up in proportion as the land is cleared.

It is a self-evident proposition that plants require rain,

but Hellriegel has shown how much they require: according to him every pound of barley requires the supply of seven hundred lbs. of water during the period it is in the ground. Trees require a different quantity from corn, and in addition they have a very great effect in draining the land, for it is found that land from off which the timber has been entirely felled often becomes swampy, and only dries again when the new plantations spring up. This fact shows us that trees exert a constant demand on the moisture of the soil, so that over-drainage of the ground must seriously affect their growth.

It is then a most important matter to determine the effect of forest on moisture. Prof. Ebermayer's experiments lead him to the view that the idea of the effect usually attributed to wood in increasing rainfall is not fully justified, and that much which has been held to be due to the timber in a country is really much more due to the contour of the country itself. The influence of forests on rain is however much greater among mountains than in the plains; it is also greater in hot climates than in cold, and in summer than in winter.

The actual amount of rain which is collected on the ground in a forest is about three quarters of that which falls on the cleared land outside. The quantity in defect does not all remain in the tree tops, as much runs down the stem; but it is found that the proportion retained by the foliage differs with the different character of the wood; thus it is greater with conifers (Nadelholz) than with leaf trees (Laubholz), and of all trees Scotch fir retains the most.

The usual proportion between evaporation from a free water surface and rainfall on the same surface during the year is that the former rather exceeds the latter. The evaporation from the ground is very different from that from a water surface, and so, as regards the soil of a wood, the proportion above mentioned is reversed, for the diminution of evaporation is less than that of rainfall. If however the wood be cleared of brushwood, leaves, &c., the rate of evaporation from the soil is seriously increased, and in fact in such a case the amount of water stored up in the ground against periods of drought falls below that in open land, owing to the fact that so much of the rain is intercepted before it reaches the ground.

The work concludes with some remarks on ozone, and on the hygienic effects of forests, and with some practical applications of the results obtained to the explanation of the causes of certain diseases which are very destructive to young fir plantations. Copious tables are appended, with an atlas of graphical representations of the results.

Our hearty thanks are due to Prof. Ebermayer for the work, which contains, as will be seen, a mass of carefully collected and important data of the highest value to the scientific meteorologist and botanist, as well as to the practical forester and the landscape gardener. R. H. SCOTT.

### Notes on Scientific Work.

#### Chemistry.

**Thermo-chemical Researches.**—The first part of a paper by J. Thomsen, of Copenhagen, on the affinity of hydrogen for chlorine, bromine, iodine, oxygen, sulphur, nitrogen, and carbon appears in *Poggendorff's Annalen*, 1873, No. 2. Attention is drawn to the value of these fundamental numbers for thermo-chemical inquiries and the vast importance of their experimental determination being conducted and checked with the greatest accuracy. With this end in view the author has passed over the ground traversed by former observers, and has met with some important facts. In the case of the number indicating the affinity of chlorine for hydrogen he finds that it has hitherto been incorrectly given, so that calculations which have been based on it are rendered valueless. Thomsen's number is 1782 lower than that of Favre and Silbermann, which has hitherto been exclusively in use. He attributes this grave error to their having employed chlorine containing

a certain amount of oxygen. The gas which they used was preserved over a solution of salt. That chlorine gradually decomposes water even in the dark is hardly to be doubted, and it would then become contaminated with oxygen or more probably hypochlorous acid. Thomsen employed concentrated sulphuric acid. The affinity of hydrogen for chlorine in gaseous hydrochloric acid is 22001<sup>re</sup> per molecule of the compound. The affinities of bromine and iodine respectively were indirectly determined by the decomposition of their compounds by means of chlorine. In the case of oxygen and of sulphur the first number was estimated by burning hydrogen in oxygen, the second by decomposing sulphuretted hydrogen with iodine; for nitrogen the reaction of chlorine with ammonia was used. To find the affinity of carbon for hydrogen the heats of combustion of ethylene and acetylene were each determined. From the heat of combustion of the hydrocarbon the heat of formation of the compound is obtained by subtracting it from the sum of the heats of combustion of the constituents. A detailed description with an elaborate drawing of the apparatus accompanies the paper, the last part of which will contain some general conclusions that these researches have enabled the author to arrive at.

**The Carbonic Acid in the Air of Soil.**—Von Pettenkofer has carried out an elaborate series of experiments for the purpose of determining the amount of carbonic acid in the air entangled in soil at different depths and at various seasons of the year. He examined, month by month during a year, the air from soil lying 4, 3, 2½, 1½, and ½ metre below the surface, and has compiled a table showing the number of volumes of carbonic found in 1000 volumes of air on each occasion. (See extract from *Sitzber. bayr. Akad. in Chem. Cent.-Blatt*, 1873, No. 4, 53.) During the greater part of the year the air in the upper contains less carbonic acid than that of the lower layers. This proportion is inverted for a short time in summer, in June and July the upper layer containing more carbonic acid (7·7 and 8·8) than the other (6·36 and 8·07). This sudden increase in the upper layer immediately precedes a proportionately much greater increase in the lower layer, for in August and September the lower again surpasses the upper layer in amount, and that to an astonishing degree. In the upper layer the carbonic acid increases from 8·8 in July to 10·38 in August and 9·93 in September, while in the lower layer it rises from 8·07 in July to 10·13 in August and 14·01 in September. In October the numbers for both layers decrease to a considerable extent: in the upper from 9·93 to 4·18, in the lower from 14·01 to 6·46, or more than 50 per cent. of the whole in each case. The paper contains many interesting speculations respecting the source of this carbonic acid.

**Chloral.**—By heating hydrate of chloral with glycerine to 230° H. Byasson found (*Compt. rendus*, 75, 1628) that a number of substances passed off and condensed in the receiver in two layers: the lower consisting of chloroform, the upper containing formic acid, hydrochloric acid, formate of allyl, and hydrate of chloral dissolved in water. The chloroform amounted to 31 per cent. of the hydrate employed.—In the *Ber. Deut. Chem. Gesell. Berlin*, 24th March, 225, J. Grabowski, writing from Strassburg, remarks that concentrated sulphuric acid is usually stated to exert no action on chloral in the cold beyond converting it after a time into an insoluble modification. He has found however that with fuming acid it unites at once to form a solid white mass made up of large crystals of the anhydride of the neutral sulphate of chloral (C<sub>3</sub>H<sub>4</sub>Cl<sub>3</sub>O<sub>11</sub>S<sub>2</sub>). This compound is not changed by cold, but is decomposed by warm water. It is likewise broken up when dissolved in alcohol, but separates unchanged from its solution in ether in the form of needles. When the vapour of Nordhausen acid is conducted into chloral a more stable compound is produced, which can be crystallized from its alcoholic solution.

**Dewalquite.**—This name has been given by F. Pisani (*Compt. rendus*, 75, 1542) to a silicate of aluminium and manganese, containing vanadic acid, which occurs in small crystalline tabular masses on quartz at Salm-Château, in Belgium. The oxygen ratios of SiO<sub>2</sub>:R<sub>2</sub>O<sub>3</sub>:RO are 5:5:3, and the manganese protoxide amounts to 26·4 per cent. The composition approaches nearly that of masonite if the iron be assumed to be replaced by manganese. Masonite however contains 5 per cent. of water, and has very different optical characters from the above mineral, which Pisani has named after the Belgian geologist. Lasaulx analysed it at about the same time, and regards it as a manganese disthene in which one equivalent of aluminium has been replaced by manganese. Pisani however finds that the whole of the latter metal is present as protoxide, and that the crystallographic and optical characters of the Belgian specimen are altogether different from those of disthene.

**Santonol.**—L. de St. Martin states (*Compt. rend.*, 75, 1190) that by the reduction of santonin a diatomic phenol, C<sub>15</sub>H<sub>18</sub>O<sub>2</sub>, a monatomic phenol, C<sub>15</sub>H<sub>18</sub>O, and a hydrocarbon, C<sub>15</sub>H<sub>18</sub>, may be obtained. The latter body is homologous with naphthalene and isomeric, if not identical, with amyl-naphthalene. The monatomic phenol, to which he has given the name of santonol, is prepared by heating santonin with zinc powder in a current of hydrogen. The new body appears to exist in two forms: as a crystalline substance resembling stearin, and as

a liquid which undergoes rapid change by exposure to the air. Both are insoluble in water, but are readily taken up by alcohol or ether.

**Phosphorus arsenide.**—This compound has been prepared by J. V. Janowsky (*Ber. Deut. Chem. Gesell. Berlin*, 24th March, 216) by the action in the cold of perfectly dry arsenetted hydrogen, prepared from sodium arsenide, on phosphorus trichloride.

Phosphorus arsenide, when freshly precipitated, forms a bright reddish brown powder which becomes dark and lustreless when dry. It is easily acted on by water, but is not attacked by cold hydrochloric acid. Potash, ammonia, or baryta decomposes it, forming phosphuretted hydrogen, arsenetted hydrogen, phosphorous acid, arsenious acid and free arsenic. Water, as has been stated, acts upon it and forms a substance having the composition  $\text{As}_2 \text{P}_2 \text{O}_3$ . Acids, with the exception of nitric acid, have no appreciable action on this body, but alkalis decompose it at ordinary temperatures. It decomposes slowly at  $100^\circ$ , and rapidly at  $250^\circ$ .

#### Anthropology.

A report on a series of excavations among the *tumuli* in the island of Sylt (*Ausgrabungen auf Sylt, von H. Handelsmann, Kiel*, 1873), conducted at the instance of the Schleswig-Holstein authorities and extending over the years 1870, 1871, and 1872, gives a detailed account of the operations, with descriptions of the objects discovered and careful engravings of the most important of them. It appears that thirty mounds were opened, and found with one exception to have been ancient places of burial. Some of them, it was seen, had been previously searched, probably for the treasure which local imagination pictured them to contain. A mound once opened in haste and in the night would have to yield its last relic as some sort of compensation. Separating the mounds into two classes according as their tenants had been burned or not before burial, and comparing their contents, no evidence was found of the one mode of sepulture having been practised, as is supposed, always exclusively of the other. Both contained the same class of relics—bronze swords, sometimes with wooden sheaths and hilts richly ornamented with those spiral and linear patterns with which we have become familiar in the best works of the so-called bronze age; bronze axes, fibulae and rings, all of which clearly mark the occupants as having been persons of distinction in their time. Occasionally an article of gold or flint was found, but the latter material never under such circumstances, even when found alone in a tomb, as would entitle its original owner to be described as having lived in the stone age. When combustion had not been resorted to, it was found that the bodies had been wrapped in the bark of trees and bandaged by shreds of the same. Some small fragments of woollen stuff were found in cases where the bodies had been burned and the ashes deposited in the tomb. Two swords which were found in one cist have this peculiarity, that their sheaths, which were of wood, were lined with leather, the hair of which had not been removed, but was turned inwards away from the blade. Each sword had been wrapped in a piece of brown woollen cloth, very little of which remained. The opening of one of the mounds (No. 24) raised a question for which it is difficult to find a satisfactory answer. For contrary to all precedent the relics, consisting of a flint saw, a bronze knife and sword in fragmentary condition, were found not inside the cist, but outside, and stuck in among the stones of which it was made, as if having forgotten them until the heavy lid had closed over the deceased, the mourners had been unable to move it again, and had sought to soothe their consciences by placing them as near the dead as they could. Not less inviting to conjecture was the result of the excavation of another mound (No. 26) within which was found a cist containing nothing but the remains of a human skull, and these under such circumstances as to leave no doubt that the head alone of some decapitated person had been interred. It may have been, as is thought, the head of a leader who had fallen on a distant battle-field, where his body would be buried, while his head, according to ancient usage, would be carried off and entombed in his native place. The absence of relics, however, does not speak for an affectionate action of this kind. It is further remarkable that the place of sepulture had been originally a cistern for collecting rain, or perhaps a small spring, the water of which kept the earth inside the mound wet till the day it was opened. The mounds of Sylt had attracted the attention of Northern antiquaries as early as 1756, in which year excavations of considerable extent were made, and the results published. Again in 1849 we find a number more opened and their contents systematically described. From that time little or nothing appears to have been done till 1870, when the excavations of which we have now the report commenced.

#### Zoology.

**New Researches on the Natural History of Bacteria.**—Dr. Ferdinand Cohn, in the second part of his *Botanical Contributions*, recently published at Breslau, gives an account of researches which he has conducted for many years on various questions relating to Bacteria. A highly important memoir was published twenty years ago by this algologist, in which he established the occurrence of various phases in

the life-history of Bacteria, especially the Bacterium-jelly or Zoogloea-form. In his new work Cohn divides the Bacteria, which he now regards as colourless algae allied to the oscillariæ, into four groups, reserving however with regard to these groups and their included genera the question of their being phases of one or more real species. These groups are spherical Bacteria (SPHÆROBACTERIA), peg-like Bacteria (MICROBACTERIA), filamentous Bacteria (DESMOBACTERIA), and spiral Bacteria (SPIROBACTERIA). The minute spherical organisms, little more than mere granules, which appear to be connected with certain diseases (vaccinia, diphtheria, pyæmia, pébrine), and which also cause coloured putrefaction, and the alkaline fermentation of urine, appear in the first group under the genus *Micrococcus*. The common *Bacterium termo* and the larger but abundant *B. lineola* belong to the second group, as well as some colour-producing ferments of which that of blue-green pus is especially interesting. The butyric ferment (*Bacillus subtilis*) and the organism connected with the disease known as "malignant pustule" and "the blood" (*Bacteridium anthracis*) belong to the third group, which likewise includes the undulate forms comprised in the genus *Vibrio*. The fourth group contains the remarkable forms of *Spirillum* and *Spirochæte*, one of which, *Spirillum volutans*, is provided at each end with a protoplasmic flagellum. The typical forms are all clearly figured in a plate. Cohn considers that the protoplasm of Bacteria is not naked as sometimes supposed, but that it has a dense cell-wall. Bacteria multiply exclusively by transverse fission and never branch; by arrest of the actual separation of new-formed cells or cytods (for there is no nucleus) they may however form chains, or grow into long filaments in which the division into separate elements cannot be recognised. (*Leptothrix* forms). They exhibit very active movements in the presence of oxygen, but become quiescent in its absence. After an exhaustion of the nutriment or the supply of oxygen accessible to them in an infusion they form a fine precipitate, and remain in this state, preserved from decomposition by their dense cell-walls; this is also the case if they are boiled or treated with reagents. According to their external effects Bacteria may be classed as Chromogenous, Pathogenous, and Zymogenous or Saproogenous. The colour-producing Bacteria are of very great interest. Their characters have been traced out to some extent by Schröter under Cohn's direction. One form especially, *Micrococcus cyanus*, Cohn found could be transferred from the boiled potato on which it made its appearance and cultivated in a one per cent. solution of tartrate of ammonium with a proportion of yeast-ash salts. Under these circumstances the production of intensely blue soluble pigment continued for some months. Sanderson had already used Pasteur's solution for the cultivation of Bacteria, but Cohn found it better to omit the sugar from the solution. The Bacteria however absolutely failed to grow if the yeast-ash salts were omitted.

As Bacteria are thus found to be capable of taking up their nitrogen from ammonia Cohn considers it probable that they always receive it in this form, or perhaps sometimes from nitrates, and that the chief work of the putrefactive Bacteria consists in breaking down complex organic molecules containing nitrogen to the condition of ammonia. Their carbon, it appears, must be in a higher condition of combination than is met with in carbonic acid, and in this respect only does their nutrition differ from that of green plants. Their vital processes, like those of all protoplasm, are necessarily accompanied by the fixing of oxygen and the evolution of carbonic acid. The specific products of their life-activity, such as pigments, foul gaseous substances, &c., are independent of the chemical changes in their pabulum and are due to internal chemical work, which goes on just the same whether they are nourished by organic infusions or by ammonium tartrate.

As to the question of spontaneous generation Dr. Cohn is of opinion that Dr. Bastian and others who have become its champions are able to make out an apparently plausible case, not only because they accept illogical conclusions and faulty experimentation, but because, as our knowledge stands at present, there are still certain conditions relating to the life of Bacteria which have not been definitely determined. Cohn has made a considerable number of experiments on the effect of heat in destroying the life of Bacteria, and finds that in such a fluid as Pasteur's a careful heating for one hour to  $62^\circ \text{C}$ . is sufficient. In other fluids higher temperatures are required and irregular results may be obtained. A boiling temperature is not certain to destroy life if small lumps are present in the infusion submitted to experiment. *Bacillus* appears to survive a higher temperature than *Bacterium*, but prolonged boiling is destructive of both, and in infusions which had thus been treated none of any kind ever made their appearance. Practically, a temperature of  $80^\circ \text{C}$ . destroys the life of Bacteria and prevents their appearance in any infusion or mass which has been raised throughout to that temperature. Temperatures below  $0^\circ \text{C}$ . render Bacteria torpid; they recover their activities however on the restoration of warmth.

## History.

**The Sixth Great Oriental Monarchy.** By George Rawlinson, M.A. Longmans, Green, & Co. 1873.

THE Sixth Oriental Monarchy, which the Oxford Professor of Ancient History undertakes to describe in this volume, is the Parthian. The book begins with two chapters on the geography and physical nature of the country, and the origin and ethnic character of the race; then, after a review of the condition of Western Asia under the Seleucid princes, an elaborate history is given of the Parthian Monarchy, from its rise as a kingdom under Arsakes and its consolidation as an empire under Mithridates I. down to its final extinction by the successful Persian insurgent Artaxerxes. The work concludes with a sketch of the architecture, religion, and manners of the people, and of their position generally in relation to culture and art.

Professor Rawlinson would regard the history of the Parthian Empire rather as a supplement to that of Rome and the West than as a mere continuation of the ancient sovereignties of the East. The main idea which underlies the whole of his book is that Parthia was the counterpoise

and rival of Rome. Rome was not the universal, unchecked power that the ordinary theory would assume it to be; but "from first to last, from the time of Pompey's eastern conquests to the fall of the empire, there was always in the world a second power, civilized or semi-civilized, which in a true sense balanced Rome, acted as a counterpoise and a check, had to be consulted or considered, held a place in all men's thoughts, and, finally, furnished a not intolerable refuge to such as had provoked Rome's master beyond endurance." This is an important truth, which the future historian of Rome will do well to regard; though we are not sure that a Roman political offender would not have preferred death to exile among "barbarians" whose language he could not understand, even if he were able to traverse successfully the well-guarded eastern provinces of the empire, or the deserts and mountain fastnesses that led to his place of refuge. That the policy of Rome, however, was profoundly influenced by the existence of its formidable neighbour, and its very continuance in great measure secured by the constant exertion and training forced upon it, is a fact which cannot be doubted; and Professor Rawlinson deserves thanks for setting it in a clear light.

In discussing the ethnic affinities of the Parthians, the author decides in favour of their "Turanian" origin, and this seems borne out by the words for "king" and "generalissimo" (*vitaxa* or *βίταξ* and *surena*) which have been preserved for us, as well as by the proper names. I cannot, however, agree with the view that "the Assyrian inscriptions are wholly silent concerning them." It is true that we find no such word as *Parth*, which represents the Persian *Parthawa* in the Babylonian text of the Akhæmenian legends, but the Elamite text has *Partsuas*, and this I believe, with Oppert and Lenormant, answers to the Assyrian *Par'suas* (W. A. I., i., 41, 31) or *Parsua*, as Tiglath-Pileser writes it. *Parsua* appears in the same list as *Ziguli* or *Zigartu*, the *Σαράπρια* of the Greeks, *Arakuttu* or *Arakhosia*, *Urvizan* compared with the *Urvâ* of the *Vêdidâd* by Lenormant and Finzi, *Ariarvi* or *Ariana*, and *Nissa*,\* the Greek *Νισαία*, the mention of which in the "Zendavesta" under the form *Ni'saya* is thought by Professor Rawlinson (p. 22) to imply that the Parthians were not yet settled in the country. I suppose this is based upon Haug's opinion that *Nisæa* has an Aryan derivation in *ni* and *'si*, "to settle."

A notice of this instructive and carefully-written work cannot be concluded without special attention being drawn to the chapter on Parthian architecture. The subject is unfortunately a meagre one, and Hatra, from which the details have principally to be taken, is rather Arabian than Parthian, while the statements of the romancer Philostratus, quoted on p. 417, cannot be trusted; but the chief point to be brought out into relief is the absolute, nomad-like inability of the Parthian to cultivate art, and this Professor Rawlinson has been successful in making clear to the mind of every reader. The court was migratory, like the court of a Genghiz-Khan; and art slept throughout Western Asia from the revolt of Arsakes until, 300 years later, Aryan influence revived again under the Sassanian dynasty and the supremacy of Persia.

**Willems on Roman Public Law.** [*Le Droit Public Romain, ou les Antiquités romaines envisagées au point de vue des institutions politiques.* Par P. Willems, Professeur à l'Université de Louvain. 2<sup>me</sup> édition.] Louvain. 1872.

THIS book belongs to a class of which there are not too many examples in French literature, but which is almost

\* *Buzus* also is found in this list immediately before *Ariarvi*. I would identify it with the city of *Bytaxa*, "the king's" town, since the form of *Vitaxa* given in Hesychius is *βίταξ*.

unknown elsewhere—that of thoroughly good philological text-books. On the one hand it is fully on a level with the best investigations, not slavishly borrowing, but testing and assimilating their results: on the other hand it is rigorously concise and systematic, the author economizing his space and the attention of his readers with perfect judgment and self-control. The Louvain students of law, for whom it was primarily intended, are happy in having a professor who is 'so well acquainted with what Mommsen calls the "Getümmel" on the building ground of antiquarian learning, and so able to construct for himself a clear and solid edifice of truth.

The method of the book is to give as text a concise and well digested *précis*, according to the view preferred by the author, while the notes—which fill on an average about half of each page—contain full references to the ancient authorities, notices of the chief books, and monographs on each part of the subject, and (where the importance of a controverted point requires it) a summary of the arguments. It would be impossible from the nature of the case to give a sufficient idea of such a work by any *résumé*. Readers will find good specimens of the mode of treatment in the pages dealing with "the Comitia Tributa and Concilia plebis" (pp. 162-164), and the "patrician senate" (pp. 199-201), which put very clearly the substance of much of Mommsen's later researches. We may also single out the section on "the communal organization of the colonies and *municipia* at the end of the Republic and during the first two centuries of the Empire" (pp. 361-381), a subject on which recently discovered documents have thrown much interesting light.

D. B. MONRO.

Chapters in the History of Yorkshire. By James J. Cartwright, M.A. Wakefield: B. W. Allen.

THE history of that ill-planned and unfortunate rebellion known as the "Rising in the North" has not had the attention devoted to it which the subject deserves. It was the last act in the long drama of feudal turbulence—the last time that the heads of the great northern houses rose in arms against their sovereign. Why it ended unfortunately we hardly know. The incapacity of the leaders must have been the main, if not the sole cause, for it is proved beyond shadow of doubt that almost all the northern and western shires sympathized with the movement, and would have joined their fortunes with the insurgents had the Percy and the Neville of those days shown the genius, or the military ardour even, of their forefathers.

The materials for such a history of this sad event as we should like to see are widely scattered, but many of the most important are probably still locked up in manuscript in inaccessible places; and those that have been edited by Sir Cuthbert Sharpe and others have come before the world in such a manner as to furnish some excuse for the historians of the picturesque school drawing largely on their imaginations for the sake of filling up the shadowy outlines.

Notwithstanding, however, the confident way in which some writers have felt justified in speaking, we have not accessible at present any evidence to show what was the origin and what were the real objects of the movement. Was it a religious war only, a rebellion entered into for the sake of establishing once more the rites of the old religion? or was there mixed up with this, selfish personal ends, and a determination to dethrone Elizabeth and place Mary of Scotland on the vacant throne?

We cannot answer these questions except by guesses until the documents bearing on the period have been sorted and arranged in something like order and sequence. In a

matter of this kind local knowledge counts for very much. We may well despair of knowing the truth until some one who is acquainted with the family history of "The North Countré" shall be moved to investigate the whole matter thoroughly.

Mr. Cartwright has not endeavoured to do this, but he has added to our stores of knowledge by printing in the sketch he has given of the life of Sir Thomas Gargrave a series of hitherto unpublished letters illustrative of the history of this crisis.

Gargrave was a notable Yorkshire worthy in his time—one of those strange combinations of good and evil qualities which cross our path so frequently in the history of the Reformation, and are in such strong contrast alike to the men of the mediæval period and those of modern life.

To Gargrave's energy as much as to that of any one man the Queen owed the suppression of the northern rebellion. But it does not really seem that any of her loyal subjects showed either genius or remarkable energy even, in her service. "The Percy's crescent set in blood," not because the ideas it represented were repugnant to the spirit of the time and called forth patriotic resistance, as the Spanish Armada threats did some years later, but because there was no head to direct, no power to coerce, the motley array of military tenants who had flocked to the rebel standard as soon as they heard their lords had determined on levying war against the southern Queen.

The part Gargrave played was not a military one. All gentlemen were soldiers in some sort then, and therefore it is almost certain that Sir Thomas had received that general instruction in the art of fighting without which he would have been a laughing-stock to his neighbours; but he was a lawyer by profession, and he seems to have served his mistress and made his own fortune in the world by that careful attention to the details of business which Elizabeth and her ministers valued much more than any imitation, however dexterously accurate, of the chivalrous manners of the bygone time. A man of knightly feelings, indeed, would hardly have relished some of the work which the Queen handed over to him. In January, 1568-9, he was instructed to assist Sir Francis Knollys in conducting the captive Queen of Scotland from Bolton Castle to Tutbury. A stronger proof of confidence could hardly have been given than selecting him for this hateful task. In a letter he wrote in the April following he alludes to this employment, and tells his correspondent, the Earl of Sussex, Lord President of the North, that Mary "hayth herd wekely at this Lent 13 sermons, every Sunday, Wednesdays, and Friday one, whereyn she hayth ben well perswadyd to the Redyngs of Scriptures."

The ruthlessness with which the northern insurrection was suppressed, or, to speak accurately, the cruelty which was shown when all resistance was over, has been little dwelt on by historians, though it is well known to those who have studied the history of the time in original documents. The papers printed here furnish a horrible illustration of this spirit. "As soon as the flight of the rebels was clearly ascertained the President of the Council issued warrants to the Sheriffs of Northumberland, the Bishoprick of Durham and Yorkshire, to seize into the Queen's hands all the lands, goods, and cattle of the rebels and their supporters, and to apprehend their persons. It was ordained that in every special place, where they gathered any strength, and in every market town or great parish, execution should at once take place, by martial law, of such as had 'no freehold, nor copyhold, nor substance of lands.'"

The object of this barbarous order is clear enough. The landed men were not to be put to death by martial law,

because if executed in this off-hand manner they would not be felons in law, and their estates would not escheat to the Crown; but the poor hinds, tradesmen, and mechanics who had done the bidding of their feudal lords were not worth trying. They were to be hanged out of hand at once like dogs. At Ripon, Topcliffe Wetherby, and Tadcaster the executions were perhaps the most numerous. But there was scarcely a parish throughout the whole of the disturbed districts where the body of some poor "papist," unknown to us by name even now, but well known to the villagers around, did not rot on a gallows for the purpose of terrifying his neighbours into loyalty to the Tudor Queen.

Mr. Cartwright prints a few passages which bear upon the history of the penal laws; but the information on that head is not so full as we could wish. There is one passage, however, in a letter from Gargrave to Cecil, written the year after the rebellion, which must not be passed over. It shows that however we in happier times may blame Elizabeth and her ministers for severe laws against Roman Catholics, they were censured in their own time for too great laxity not by religious fanatics only, but by capable business men, whose feelings about religion may without injustice be assumed to have been kept in strict subordination to their politics.

"Yf any refuse the service or communion, I wold wyshe them," Gargrave says, "convyned by opyn disputation in every shyre before Comysyoners; and yf they wyll not relent to the treuth, I wold wyshe them attayntyd in *premunire* for one yere, and yf they stycke at the yeres end, then to be dethe for herseye or treason."

Sir Thomas Gargrave survived the rebellion upwards of ten years. He died possessed of a large estate, the greater portion of which had been acquired by his own labour. In the latter years of his life he dwelt at Nostel Priory, near Wakefield, not in the present princely residence, which was built in the middle of the last century, but in the old priory, much of which remained until it was demolished, when the new house arose.

The early chapters of the book, as they relate almost entirely to events of national importance, are by far the most interesting; but the whole is well edited, and will richly repay reading by those who desire to comprehend the social life of their forefathers.

The chapter on "Towns and their Trades" contains new and important information. EDWARD PEACOCK.

### THE HISTORICAL MSS. COMMISSION.—III.

THE Royal Historical Commissioners, whose second Report was noticed in the *Academy*, No. 21, have now issued their third Report, giving accounts of upwards of a hundred public and private collections which have been examined and reported upon during the past year. They also report that two important collections, that of the Earl of Macclesfield, purchased by the British Museum, and of the Earl of Shaftesbury, deposited by him in the Record Office as a free gift to the nation, have become public property. The most valuable portion of this gift is the correspondence and papers of the third Earl—author of the "Characteristics"—and those of John Locke, notably among the latter a copy in Locke's hand, with his own corrections, of the first set of constitutions for Carolina.

Historical students will rejoice to learn that the great treasury of manuscripts well known as the Cecil Papers, belonging to the Marquis of Salisbury, has been thoroughly examined. This, the most valuable private collection in the kingdom, consists, Mr. Brewer reports, "partly of ancient vellum MSS. of early date, partly of correspondence, commencing with the reign of Henry VIII., and ending with that of Charles II." But the mass of the papers refers to the reigns of Elizabeth and James I., and minutely illustrates the events of the whole period. The index alone to the documents belonging to the reign of James takes up thirty closely printed pages. Among the Elizabethan archives are papers relating to the Queen's personal history before her accession, and important documents bearing upon the intrigues con-

nected with Mary, Queen of Scots. Among the latter was found one of the casket letters, a valuable discovery, for though it forms part of the series already known, and is numbered by Lord Burleigh in his peculiar fashion, its handwriting differs from that of the rest, and the French, in which it is written, has undergone numerous corrections. Only second in importance and extent to the MSS. at Hatfield House are those belonging to the Marquis of Bath. This collection is remarkably varied in character, amply illustrating, and from very early times, the civil, military, naval, ecclesiastical, and literary history of the country. Among the numerous remains of early English and French prose and verse, the French original appears of a poem given in Joshua Barnes' Life of Edward III., as having been composed in Latin by Edward II. while in prison. Its historical treasures include the famous Red Book of Bath, an early fifteenth century volume of legal and historical miscellanies; a Chronicle of London from Richard I. to Henry VI., more full than that published by Sir Harris Nicholas; two fine copies of Higden's Polychronicon, and one of Bellenden's History of Scotland. Among legal works are ancient copies of Bracton, Britton, and early statutes and law tracts. There are numerous ancient registers of lands and charters, household inventories, and accounts of the sixteenth and seventeenth centuries, &c. The original correspondence at Longleat is very important; it includes numerous letters by Queen Elizabeth and members of her Council, some of them touching upon the intended execution of the Queen of Scots. There are also letters by Charles I. and II., nine original letters from Cranmer, others by Parker and Whitgift, Hatton, Bodley, Coke, Raleigh, Bacon, Cecil, Buckingham, and other celebrities. The literary correspondence includes that of Matthew Prior, letters by Swift, Pope, Locke, Gibbon, &c. Among other matters of interest is an account-book of Arabella Stuart, on the last leaf is a note of her marriage, with the date and names of the witnesses; the marriage-settlement of Amy Robsart, with a letter in her handwriting, and a list of splendid jewels given away by Prince Charles on leaving Spain.

The Duke of Northumberland's extensive collection includes documents illustrating the state of Ireland towards the close of the sixteenth century, and others bearing upon the English settlements in that country. It is rich in documents illustrating the Civil War and the period of the Restoration; notices of the Duke of Monmouth and his rebellion, &c. The Duke of Devonshire has *inter alia* a long and valuable series of household books of the sixteenth and seventeenth centuries, notices of the Civil War, and letters of Court gossip *temp.* James and Elizabeth; one of the latter describes Arabella Stuart's visit when a child to Court, how the Queen was cold, and Burleigh genial, how he praised her Italian and music, wished she were older, and "with that rownd Mr. Rawley in the eare, who answered him it would be a happy thing." The Marquis of Westminster possesses a fine copy of Henry of Huntingdon's Chronicle, containing a contemporary (twelfth century) drawing of Baldwin Fitz-Gilbert about to harangue the Royal army before the Battle of Lincoln, by order of King Stephen; many valuable charters and a large mass of historical papers. The diplomatic papers of Sir Charles (afterwards Lord) Whitworth running over the first quarter of the eighteenth century are at Buckhurst, Earl Delawarr's seat; the Earl of Chichester possesses the extensive correspondence of Thomas, Duke of Newcastle, from the time when he took office in 1724, up to 1768, containing valuable information for the history of the country, its political parties, and its foreign relations.

In Lord de Lisle's library at Penshurst are upwards of four hundred early charters to the Abbey of Robertsbridge; numerous papers relating to Ireland and Wales under the governorship of Sir Henry Sidney, *temp.* Elizabeth; many volumes of letters to the Sidneys in the sixteenth and seventeenth centuries; a notice of the fact that Sir Philip Sidney, when a child of ten, held church preferment; and other unpublished matter of great interest. Sir Henry Bedingfield's series of letters showing the names and treatment of prisoners in the Tower, *temp.* Queen Mary, is noteworthy. The Rev. Walter Sneyd has holograph letters by Queen Elizabeth, Mary Queen of Scots, James I., Charles I. and his Queen, Charles II., James II., and his son James, William III., the Duke of Marlborough, and other historical personages.

He also possesses the diary of the travels of Alessandro Magno, a Venetian who visited England early in Queen Elizabeth's reign. Among Mr. Egerton Warburton's papers are letters by Hobbes, Cowper, Coleridge, and many other literary celebrities of the seventeenth, eighteenth, and nineteenth centuries. In the muniment room of Mr. le Strange, of Hunstanton, are numerous letters ranging from the fifteenth to the eighteenth century, churchwardens' accounts covering the same period, and important household books of the fourteenth, sixteenth, and seventeenth centuries. In the Neville Charter Chest are interesting news letters, mainly written from London, by Count Gastaldi, agent in England of the Genoese Republic from 1739 to 1760. Sir Henry Gunning's collection is exclusively diplomatic, comprising the official correspondence of Walter Titeley and Mr. (afterwards Sir) Robert Gunning; the former was Envoy Extraordinary at the Court of Denmark from 1728 to 1736, and the latter held the same post at the Courts of Denmark, Berlin, and St. Petersburg, from 1766 to 1774.

Mr. Riley's second Report of the documents belonging to the Dean and Chapter of Wells describes a large number of ancient deeds, some of which illustrate the early history of the Wellesleigh family; a conveyance establishing the fact, hitherto disputed, that Henry Beaufort was Dean of Wells; two letters written by Edward II., and Thomas, Earl of Lancaster, after the Battle of Bannockburn, pressing Bishop John de Drokenesford to forward certain moneys; exemplification of the charter, "De Prisis bonorum," to Edward I.; and the original copy, deposited in the Church of Wells, of the sentence fulminated by the Bishops of England against those who should violate the liberties contained in the Charters of England 37 Henry III.—perhaps the only original copy now extant. Among the documents of the Corporation of Bridgwater, mentioned in Mr. Riley's second Report, are a Welsh-English religious poem of the fifteenth century, a lease written in Somersetshire-English of that date, while a contemporary specimen of Irish-English is furnished through a communication from the Town Council of Youghal to that of Bridgwater, A.D. 1475. Here are upwards of a thousand deeds relating to transfers of property between the reigns of Henry III. and Henry VIII.; also above a hundred documents referring to the town and university of Oxford, mostly in the reigns of Edward IV. and Henry VII. The municipal records of Axbridge offer interesting illustrations of social, religious, and civic life in a West of England town in the Middle Age. At Totnes, the Rolls of the Mayor's Law Court, fifteenth century, supply the particulars of the building of the parish church tower; and conspicuous among still more ancient records are the various rolls of its Merchants' Guild, beginning A.D. 1260, and coming down to 17 Edward III. (A.D. 1343). The border town of Berwick-upon-Tweed has a large number of early archives. They date as far back as the reign of Edward III., and from the accession of Elizabeth the series is tolerably complete. On the other hand, Kingston-on-Thames preserves no records earlier than the reign of Henry VII.; its churchwardens' accounts of that time present notices of May-day minstrels, morris dancing, and "Robin Hood games." John Bowtell, a Cambridge bookseller, left in the first quarter of this century to Downing College his collections illustrating the history of the county, university, and town of Cambridge. Most of these papers, none of which are in print, are of special interest and value. Noteworthy among others are the series of accounts of the town, ranging from A.D. 1510 down to 1787; collections made in the seventeenth century for a history of each of the Cambridge colleges; the gossiping commonplace book of J. Wickstede, mayor in 1613; and the diary written in somewhat Pepysian fashion of John Newton, a Cambridge burgess, in the latter part of the seventeenth and beginning of the eighteenth century.

In Scotland Mr. Fraser has made a second report on the muniments and archives of the Duke of Montrose. He describes (1st) the official correspondence of the first Duke from 1700 to 1755. Besides a holograph letter of thanks from Queen Anne for his services in promoting the Union between England and Scotland, this includes the Duke's correspondence with John, Earl of Mar, and many leading statesmen; a series of letters referring to the insurrection in the year 1715; and notices respecting the proceedings of Rob Roy. (2.) The charters and correspondence of the Earls and Dukes of Lennox from 1177 to 1603. Here is an unpublished letter from Queen Mary to her father-in-law,

the Earl of Lennox, complaining of Darnley's conduct towards her, and also a letter of James VI., written in his ninth year, to Captain Thomas Crawford, who had taken Dumbarton Castle by stratagem; another holograph letter of James VI., probably written about 1600, refers to raising money to promote his succession to the English crown, and a third dated March, 1603, requests the Duke of Lennox to accompany him to England. (3.) The Menteith muniments, containing many ancient charters, and several unpublished letters from Charles I. and Charles II. Lord Seafield has at Cullen House a fine series of family charters illustrating the succession to the lands from 1437 downwards; writs of the foundation of the collegiate church of Cullen, among them a charter of endowment by King Robert Bruce. Later papers include Queen Anne's "private instructions" to the first Earl of Seafield, as Commissioner to the General Assembly in 1703, and a series of letters from Lord Hardwicke, 1747 to 1764, bearing on the settlement of the country after the rebellion. The charters at Crawford Priory are not less remarkable. "One of them," says the Report, "is a charter by William of Keith and his wife at their Manor of Kynlor in 1380, remarkable for preserving in the list of witnesses a picture of the little Court assembled within the walls of this great baron. It numbered representatives of the baronage, of literature, and of trade. They were Robert, Earl of Menteith, James and Alexander of Lyndesay, knights, John Barber, Archdeacon of Aberdeen, William of Fenton, Alexander of Stratoun, and John Crab, burgess of Aberdeen. Here we find the future Regent of Scotland, with the poet Barbour, and a wealthy burgess of Aberdeen, descended from Crab, the Fleming, who helped to defend Berwick in the time of Edward II." The papers of Sir Patrick Murray are numerous and important. Among them is a record of a series of Baron Courts held on the Moothill of Langforgrund in 1385, partly written in Scotch, and presenting a specimen of the vernacular contemporary with Barbour's Bruce. The collection of Mr. Dundas, of Arniston, is rich in illustrations of local and national history; the charters begin with a series of deeds of the Knights Templars, the earliest dated 1354;—there are numerous miscellaneous documents dating from 1538;—household and estate account-books full of valuable statistics during the next century; and a large mass of correspondence coming down to 1819, more or less of a public character. The letters belonging to Mr. Webster, Aberdeen, are equally valuable; they include letters from Cardinal Beaton, the Regent Murray, different members of the royal family of Stuart, and several statesmen of the seventeenth century. At Wemyss the series of family records begins in 1250. There is a large collection of letters from the sovereigns of Scotland and public men; others from Charles I. and II., General Monck, Archbishop Sharp, &c. The records of the university of Glasgow are full and complete from its foundation in 1450; in addition to these Dr. Stuart describes the very valuable manuscripts, many of them beautifully illuminated, and other original records preserved in the Hunterian Museum.

In Ireland Mr. Gilbert reports on the Ormond archives, which are found to be rich in unique documents from the twelfth century, and in MS. books, State papers, correspondence and miscellanea to the early part of the eighteenth century. The whole collection is of the highest historical interest and of truly national importance. Dr. Russell gives an interesting account of the famous ancient cartulary, known in Ireland as the *Liber Nigre*, or Black Book of Limerick. Its entries, beginning 1194, consist of papal rescripts, charters, and other documents, throwing light not only on the antiquities and topography of Limerick, but also on the social history of the Anglo-Irish community. Dr. Russell especially notices one curious document, an inquisition taken 1201, under an order of Meyler Fitz-Henry, Grand Justiciary, by William de Burgo, of the property of the Bishop of Limerick. The inquisition was held under a jury representing the three classes of the citizens, and was *trilingual*, consisting of twelve Englishmen, twelve Irishmen, and twelve *Ostmen*, or *Danes*. This is noteworthy as illustrating the strong foothold which the Northerners had at that period taken in the seaboard towns of Ireland. Not only in Waterford and the towns of the eastern coast were they fully established as an important part of the community, but here we find them holding the same place in a remote western port such as Limerick.

Among the special subjects upon which the present report throws additional light may be mentioned (1) The history of religious and craft gilds in England. Apart from scattered notices of these ancient associations, there is, belonging to the Marquis of Bute, preserved intact the Book of the Gild of the Holy Trinity of Luton, Beds., written in English during the first half of the sixteenth century. Its accounts are full, illustrating the history of the fraternity, its religious observances, the ritual and ancient state of Luton Church, the rate of wages and price of materials; it gives also the items, with their cost, of the annual gild feasts, &c. The companion volume is its register, richly illuminated and furnishing the names of all members enrolled from 1475 to 1546. The History of English Gilds, published by the E. E. Text Society, includes neither these records, nor those of the Merchants' Gild of Totnes preserved in the archives of the Corporation. Here are several rolls of the Gild, with entries full of curious details, beginning A.D. 1260, and coming down to 17 Edward III., A.D. 1343.

(2.) Among Biblical Manuscripts may be mentioned the inestimable seventh century copy of St. John's Gospel, said to have belonged to St. Cuthbert, and now in the library of Stonyhurst College. The Rev. Sir W. Cope, among other valuable ancient books formerly the property of different abbeys, possesses a splendid Evangelium, end of tenth or beginning of eleventh century, only second in beauty to that of Col. Carew described in the former Report. The Marquis of Westminster also has a beautiful Evangelium (thirteenth century); the Marquis of Bute an early thirteenth century Greek Book of the Gospels, and an English metrical paraphrase of the Gospels, fourteenth century, while at Longleat is part of a sixteenth century copy of a poetical version of the Old Testament, and early MSS. of Wyclif's translations.

(3.) Apart from Wyclif MSS., the collection at Longleat is rich in valuable works illustrative of early English literature. A large body of religious prose and verse belonging to the fourteenth and fifteenth centuries includes works by Richard de Hampole, Walter Hylton, John Morton, Bishop Alcock, anonymous religious tracts, Passion poems, &c. Here are also many pieces by Lydgate, Chaucer's Knight's Tale, and Grisilda (1400); the Persone's Tale, a fifteenth century copy. In a small folio (middle of fifteenth century) of minor poems by Chaucer and Lydgate, sixteen leaves containing, as shown by the table of contents, the Flower and the Leaf, with the first part of the Complaint of Mars, are unfortunately missing. Connected with Chaucer is a long letter from Hearne, the antiquary, Oxford, 28 May, 1709, concerning the poet and the various editions and copies of his works. At Alnwick Castle is an MS. of the Canterbury Tales. In the Hunterian Museum are E. E. sacred poems, Trevisa's translation of the Polychronicon, works by Gower, an MS. of the Canterbury Tales (late fifteenth century), and the copy, unfortunately still unique, of the Romaunt of the Rose. The Marquis of Westminster's highly interesting fifteenth century MS. of Piers Plowman presents variations from the texts lately printed by the E. E. Text Society. Mr. Legh, of Lyme, has a fine early copy of the Scottish Field, an alliterative poem; the Rev. Sir W. Cope a long poem, *circa* 1500, on the life and Passion of Christ, and the Rev. Walter Sneyd an early MS. of Sir John Mandeville's travels, and medical treatises of the sixteenth century.

This Report being particularly rich in documents illustrating the history and personages of the seventeenth century, it will be worth while to select from its various collections the most interesting papers connected with that eventful period for the purpose of presenting them in chronological sequence. Among the Phelps' MSS. are preserved the archives of the Gunpowder Plot (1605); papers and a series of letters bearing on the Spanish Match, and notes of the evidence against Lord Bacon, with an original letter (7th September, 1619), mentioning that the King had received five hundred articles of complaint against the Chancellor, had said that were they proved he would make him an example to all ages, and threatens to hang him. The Report mentions many original letters from Bacon—one November 13, 1619, gives Buckingham the news that Lord and Lady Suffolk are fined £40,000 and imprisoned—and all the documents connected with the Chancellor's impeachment. Correspondence and papers connected with and by Sir W. Raleigh are likewise numerous; the former, mostly dated from the Tower, include letters to his wife, to Cecil, the Privy Council, and the King.

One to James (1607) concerning Guiana is probably still unprinted; another addressed to Sir Francis Bacon appeals to him "to spend some few words to ye putting of false flame to flight." The State and other documents throwing light on the affairs of the Palatinate are noteworthy, especially a series of letters, dating from 1619 to 1637, on the subject, and a highly interesting volume of family correspondence formerly belonging to Prince Rupert, and containing the letters of the Elector Frederic to his wife, the Queen of Bohemia, giving in detail the progress of the war and his disasters, with others addressed to her by her sons, Charles and Rupert, and her royal relatives in England.

Among the important contributions which appear in this Report towards a history of religious parties under James I. may be specified—a petition of the commonalty in Sussex complaining of the tyranny of the ecclesiastical courts, and setting forth the dearth of religious instruction throughout the county (1603); various collections showing the same state of things in existence throughout Cornwall, Staffordshire, and Lancashire; lists of presentments for non-attendance at church; treatises concerning the disagreements in the Anglican Church, &c. Here is a letter from Williams, Bishop of Lincoln, to the minister of Grantham touching the placing of the communion-table. It is to stand not "altarwise," but "otherwise," and in any "place in the church or chancel where the minister may be conveniently heard." Also a characteristic letter (*circa* 1612), printed in full, from Abbot, Archbishop of Canterbury, to Matthew, Archbishop of York, urging him to use severer measures against recusants. The Bishop of Southwark has a remarkable series of various documents illustrating the condition of English Catholics throughout the century, and at Stonyhurst is a still more important mass of papers connected with the same subjects. Lastly, the library of the Rev. Dr. Williams, Bloomsbury, contributes highly valuable materials for the history of Nonconformity.

Passing on to the reign of Charles I., we find in the library of Sir Rainald Knightley a MS. account of the Parliament of 1625, written *de die in diem* by a Member of the House, and furnishing considerable additions to our knowledge of that important session from which the breach between the King and Parliament dates. Among the archives of the House of Lords are ten Minute Books, *i.e.* records of their proceedings, ranging from the last years of James I. up to March, 1644-5; papers connected with Archbishop Laud's visitations, and a set of documents dating from February, 1630-1, to March, 1639-40, respecting John Durye's mission to the continent, made under Laud's auspices, for the purpose of effecting a pacification between the Lutherans and Calvinists. Here too we meet with a document which takes up a loose link in the history of Strafford's trial—Pym's copy of Sir Harry Vane's notes of speeches made by the Earl and others at "a giunto" of the Privy Council for the Scotch affairs, 5th May, 1640. In fear of consequences to Strafford, Vane had destroyed the original; but this copy, read in both Houses, and fraught with evidence fatal for the Earl, greatly helped towards the passing of the Act of Attainder. To the Duke of Northumberland belongs a large mass of papers illustrating the history of the Civil War; some of these show the poverty of the Exchequer and debasement of the coinage in 1640. Here is a copy, certified by Sir John Borough, of the Lords' letter from York, 25th September, 1640; a copy of the letter of the King's Commissioners at Ripon, 21st October, 1640, varying from that among the State Papers; speeches and notes of speeches in Parliament, 1641 and 1642; also many letters and papers of interest touching the progress of the war. The Duke of Devonshire has an important series of letters (1633-48) containing details of the struggle in the North between the Royal and Parliamentary forces. In other collections we find papers touching Parliamentary levies in various Bedfordshire parishes (1642-3); others about Royalist levies in Norfolk; letters relating to the movements of the King's army in Wales under Byron; a full account of the defence of Brampton Bryan Castle, Herefordshire, and scattered papers illustrating the general distress entailed upon the community during the Civil War. The only known evidence of Cromwell having been a captain of foot is here supplied by a warrant, 17 December, 1642, from the Earl of Essex, for payment of moneys to "Captain Oliver Cromwell," with a holograph letter by Cromwell requesting the payment to be made to George Barton, his servant. The original of Sir Bulstrode Whitelocke's account of his em-

bassy to Sweden, under the Commonwealth in 1653, exists, as is well known, at Longleat. But among the papers of the Marquis of Bute a most valuable recovery has been made of the missing "Annals" of Whitelocke—an autobiography in his own handwriting, mainly in the form of a diary, and recording his personal history from his birth in 1605 up to July, 1675, about a month before his death. GEORGE WARING.

### Contents of the Journals.

Von Sybel's *Historische Zeitschrift*, erstes Heft. 1873. Pauli reviews Freeman's *Norman Conquest*, vol. iv., especially praising Freeman's account of the commercial rights already existing at Exeter, Lincoln, &c., and the way in which he uses the historical information contained in Domesday.—An article on "Dante and the Two Confessions" shows that Dante, starting from Catholicism as his basis, has in many points emancipated himself from the priestly theory, and so far approximated to Protestantism.—An account of Von Harrach's mission to Spain, 1696-7, supplies a clear picture of the relations of the Spanish Court to Austria and France just before the war of the Spanish Succession.—Max Lehmann gives a critical and instructive analysis of the French accounts of the war of 1870 up to the siege of Metz.—The literary notices contain a summary of Brunner's "Origin of the Jury System." Brunner traces it back through the Normans to the Frankish kings, who introduced this mode of investigating a charge as a means of so far setting aside the popular law of trial, much as the Roman pretors allowed modes of trial which practically did away with the *Jus Civile*.—There are also short notices of the late publications of the *Rolls Series*, Stubb's edition of Hoveden, Hardy's *Catalogue of Materials*, Twiss's *Black Book of the Admiralty*, and Gilbert's *Irish Documents*. The number concludes with a sketch of the proceedings of the *Hanseatic Historical Society* and the *Munich Historical Commission*. The whole number is a very good one.

### Philology.

- On a Cuneiform Inscription describing the Deluge; by G. Smith. Read before the Society of Biblical Archaeology, December 3rd, 1872.
- Chaldean Account of the Deluge. Photographed by Steph. Thompson, with translation by G. Smith. W. A. Mansell & Co. 1872.
- Le Déluge et l'Épopée babylonienne, par Fr. Lenormant. Reprinted from the *Correspondant*. Paris, 1873.

THE discovery of the native Babylonian account of the Deluge, which has rewarded the patience and skill of Mr. G. Smith, is one of the most important and valuable ever made in the province of archæology. The trustworthiness of Berosus has been confirmed in the most decisive way, thus enabling us to rely upon his statements where they are

not corroborated by the monuments; and a new light is thrown upon the origin and meaning of Western Asiatic mythology. The story of the Flood, instead of being borrowed by the Chaldean historian from Genesis, must have been derived by the Hebrew writers from Babylonia. There alone is it significant, and a part of a great epic cycle.

The narrative is contained in the eleventh tablet of a series of twelve which record the adventures of a mythical hero who may provisionally be called Gisdhubar or Gisdhumas. The British Museum possesses three mutilated copies of these (from the library of Assur-bani-pal). Mr. Smith has found and pieced together about eighty fragments of them. The original text came from Erech, and must have been translated into Semitic at an early period, since the three Assyrian copies present variant readings, have incorporated glosses into the text, and have sometimes retained the original hieratic characters when their modern equivalents were unknown. Mr. Smith's unrivalled powers of deciphering guarantee the substantial correctness of his translation, and those who are able to test it know that his renderings are fully to be depended upon, except of course in the doubtful reading of certain proper names.

Gisdhubar and his servant Hea-bani, according to the legend, went to seek the translated son of Ubara-tutu, the Sisuthrus of Berosus, whom Mr. Smith calls "Sisit." After forty-five days the mouth of the Euphrates is reached, where "Sisit" stands on the other side of the waters of death.\* He tells Gisdhubar the story of the Flood: how on account of his piety the gods of his "ancient city" Surippak warned him of a deluge that was about to destroy all mankind for their sins, and how Hea ordered him to build an ark. The height and breadth of this were the same, and it was coated within and without with bitumen. This preserved "Sisit" and his family and pilot, with "all the seed of life," for the seven days during which the deluge (sent by the sun-god) was raging. "All life" was "destroyed," and the ark finally rested on "the mountain Nizir" (*Sad-u Ni-sir*). After seven more days "Sisit" opened the window and sent forth a dove, which returned, then a swallow, which also returned, and finally a raven (*aribi*). Then he left the ark and built an altar on "the peak of the mountain" (*'siggurra' tadi*), cutting herbs "by sevens" (*'siba' u' siba'*); and the gods smelt the sacrifice, and at Hea's prayer Bel made a covenant with "Sisit" and declared that he would not again destroy man with a flood for his sins. After this "Sisit" was translated.

Mr. Smith adds to his translation a comparison of the cuneiform narrative with the accounts of Berosus and Genesis, but does not attempt any further analysis of the legend. Sir H. Rawlinson, however, in a letter to the *Athenæum* (December 8th, 1872) suggested that Gisdhubar was a solar hero, the twelve tablets recording his labours during the twelve months of the year. The eleventh month was the month "of rain" in Accadian, whence the name of the zodiacal Aquarius; and this would suit the Deluge-myth as perfectly as the conquest of the winged bull by Gisdhubar in the second tablet agrees with the second month "of the favourable bull" (Taurus) or his marriage with Istar in the sixth tablet with the sixth month "of the errand of Istar." The suggestion is borne out by the correspondence of the legend of Bul, a sea-monster which demanded an annual tribute of young girls for its food and was slain by Gisdhubar and his huntsman Tsaid, with the fourth month of "the seizer of seed" (Cancer). The legend is compared by Lenor-

\* Tuoni is the river of death in the Kalewala. The river Datilla is called "the lord of the house of death" in W. A. I. ii. 62, 50, and Tu, "the setting" sun, is given as the god of death (W. A. I. iii. 67, 21).

mant with the myth of Perseus and Andromeda, which Eckstein has traced back to Babylonia, where the inhabitants were originally called Kephenees according to Stephanus of Byzantium. I believe that the third tablet, answering to the month of "the twins," or "the bricks," as it is also named, will be found to contain a story not unlike that of Cain and Abel, and of the foundation of the first city, Enoch.

M. Lenormant's pamphlet is an acute and learned commentary on the inscription. He shows from the traditions given by Berosus, as supported by the evidence of the monuments, that the Accadians possessed a connected epic cycle, like the Kalewala of the Fins or the Kalepoe of the Esths, which included the episodes of the creation, the ten antediluvian kings, the Tower of Babel, &c., copied by Greek writers from Berosus. This cycle was borrowed by the Assyrians along with the old theology and literature; but I much doubt whether the Assyrians ever had an epic of their own, such as M. Lenormant believes he can recover from the pages of Ktesias, and whether M. Rénan's view that the Semite could never originate an epic is not after all the true one. The descent of Allat of Cutha, another form of Istar, into the land of the dead, which is translated in Lenormant's "Essai de Commentaire des Fragments de Bérosee," Frgt. xx., belongs to this epic. After lamenting the premature death of her husband "The Son of Life," Allat passes through the seven gates, at each of which she leaves part of her apparel, down to Hades and the golden throne of the Anunnaci, where she is purified by Mamit, Istar, and Hea, who has been fetched by his son the Sungod. The story clearly refers on the one side to Tammuz, and on the other attaches itself to the legend of the sixth month. We may compare the legend of Tammuz in Ibn Wahshiya, and the lament of the gods over him in the Temple of the Sun.\* This is noticed by M. Lenormant, who refers to the transformation of the Vedic deities into the Iranian leaders of the first generations of mankind, and then goes on to review the Hindu account of the Deluge. This is first found in the 'Satapatha-Brahmana; and Eugène Burnouf long ago proved that it had come into India from a foreign source. The fish that aided Manu would be "the saving fish-god" Hea, the earth primarily, and then the deity of the hearth and the river. As the planet Mercury, Merodach, "the eldest son of Hea," was called "the fish of Hea" (*kha-Enu-ci*) in the month of Adar (February); and I would explain the double fish of the modern zodiac by the fact that the last month of the year was a double one through the intercalated Ve-Adar (Accadian *dir-se*). M. Lenormant suggests that, like the legend of the Deluge, the churning of the sea by the help of the serpent Vāsuki also made its way into India from Babylonia; and he reminds us that Tiglath-Pileser II. penetrated as far as the valley of Indus, while Sennacherib speaks of the precious wood of *Sinda*, and Col. Taylor has found pieces of teak at Mugheir. We may add to this the mention of *Mitra* in a mythological tablet as a name of the sun. Von Bohlen long ago ventured on the conjecture that 𐎢 in Gen. iii. (a misapprehension of 𐎢𐎣) was India, and the land of Andiu, which is described by the Assyrian king as "a distant place" (W. A. I. i. 35, 9), may very possibly confirm this, the loss of the initial sibilant showing that the name had made its way into Assyria through the medium of a Persian population.

The more I investigate the mythology of Accad, the more

\* Tammuz, we are told, belonged to the Janbans or Janbasiyans, the primeval inhabitants of Babylonia. Perhaps we may discover

*Gan-duni* or *Gan-duniyas* (Southern Chaldaea) in the 𐎢𐎣𐎶 of Dimeshki and the variant readings with an inserted sibilant of El-Marizi (Chwolson, "Die Ssabier," ii. pp. 414, 607, 680).

I am convinced that it is for the most part of solar origin. The larger part of the gods, such as Adar, "the sun of the south," or Rimmon, "the south sun in Elam," resolve themselves into the great luminary of day. Hence it is not surprising that the epic cycle of Babylonia should revolve round the same centre. Gisdhubar, whose ship is called "the ship *gis-tuk*" in W. A. I. ii. 46, 3, may be the god of fire, with *dhu*, "mass," or "body," inserted in the middle of the compound; and the name read "Sisit" by Mr. Smith means "the sun of life," which would be pronounced *Tam-zi* in Accadian. It is impossible not to compare this with Tammuz. The character of Tammuz, however, better suits the first husband of Allat-Istar, whose name would be read in Accadian *Dū-zi* (see W. A. I. iii. 70, 120). Now this exactly agrees with *Dūzu*, the Assyrian form of the month Tammuz, and we can only account for the variant Tammuz by a confusion of *Tam-zi* and *Dū-zi*, two several forms of the sun. *Dū-zi* is associated with *Cittu*, the sun, in W. A. I. ii. 59, and Istar seems there to appear as his mother. The translation of *Tam-zi*, on the other hand, leads us to the Biblical Enoch, whose name (like that of 'Qavvys in Berosus) may be explained by *kha-Enu-ci*, "the fish of Hea," that is, Merodach at the close of the 365 days of the year. Now Merodach was primarily solar, as is shown by his Accadian name *Amar-ud* or *Amar-utuci*, "the circle of the sun," and he might be described as rising either out of the earth (Hea) or out of the water. The name of *Tam-zi's* father, again, *Ubara-tutu*, or "the glow of sunset" (see W. A. I. ii. 2, 254) perhaps reminds us of 𐎢𐎣 "the setting" sun. How *Tam-zi* comes to be called *Sisuthrus* by Berosus it is not very easy to say; since *Sisuthrus* must be *Susru*, an old Chaldean name of Anu, or Na, "the sky." *Na* or *Nakh*, however, seems to claim kindred with the Biblical Noah, and an ancient Accadian ritual speaks of "the great flood of Anu in the midst of heaven" (W. A. I. ii. 19, 40). It is possible, therefore, that Anu was rather the sky of day, as synonymous with the sun, his mother *Zigara*, or "heaven," being the sky properly so-called; and it is noticeable that Nagidhdha, the wife of Anu, is "the queen-mother, the moon." At the same time a geographical discrepancy has to be admitted: Gutium or Kutu, which seems to be the country between the Euphrates and Syria, is called "the fortress of Anu" (W. A. I. ii. 48, 14), while Nizir was the mountainous district to the east of Assyria, which, according to Assur-nazir-pal, was called by its inhabitants Lullu of Cinipa. Still the situation of Gutium is not quite certain; and we find Anu entitled "the lord of the land of the East" (W. A. I. ii. 54, 45).

A. H. SAYCE.

Library of Anglo-Saxon Prose. [*Bibliothek der angelsächsischen Prosa.*] Von C. W. M. Grein. Erster Band. Cassel und Göttingen: G. Wigand. 1872.

IN the present work we have the first instalment of a series of Anglo-Saxon prose texts by the well-known editor of the "*Bibliothek der angelsächsischen Poesie.*" Dr. Grein says in his preface that he originally looked forward to passing some time in England, so as to be able to take his texts directly from the MSS. instead of having to base them on the often untrustworthy English editions. Unfortunately he has not been able to carry out this plan, and has therefore been obliged, as in his edition of the poetry, to follow the English editions, only regulating the orthography and making such emendations as were possible without access to the MSS.

This plan has, however, been modified to a certain extent. When the present volume was nearly all printed off, Dr. Grein received intelligence from England of the great inaccuracy of the later English editions, with an offer to collate

the proof-sheets of future texts with the MSS. before publication. The present volume being so far advanced, it was not judged advisable to delay its issue till it was collated with the MSS., especially as the edition on which it is based was described as being tolerably accurate. The results of such a collation are, however, to be given in a later volume.

There can be no question that this assistance will greatly increase the value of the series. Indeed, without MS. correction much of it would be worse than useless: only those who have gone through the weary drudgery of correcting such work as the A.S. publications of the Surtees Society word for word by the MSS. can fully appreciate its importance. The best guarantee for the efficient carrying out of the task is the name of the scholar who has undertaken it—Mr. Skeat, of Cambridge. We earnestly hope Mr. Skeat may not be left alone, and that other competent Saxonists may come forward in the same liberal and disinterested way. We should of course like better still to see the burden taken off Dr. Grein's shoulders, and see the work done efficiently by Englishmen; but of this there seems little chance at present.

While wishing Dr. Grein every success in his spirited undertaking, we cannot suppress certain misgivings as to the value of some of his future texts, even with the promised MS. collation. In those cases where they are founded on a single MS. we have nothing to say against the result—instead of the cumbrous, expensive, and often inaccurate English edition we shall have a cheap and reliable text in the most convenient form. Where there is a number of MSS. the case is very different. A reproduction of a single MS. or a text founded on a mass of readings gathered at random from a variety of MSS. of different ages and value cannot be called a "critical" text. The MSS. themselves must first be accurately classed by age, dialect, and genealogy. Now this can only be done by a man who has qualifications which Dr. Grein cannot and does not possess. He is ignorant of A.S. palæography, and can get his knowledge of the MSS. only at second-hand, and seems to know nothing about the chronology and dialects of the language, if we may infer so much from his treatment of the old forms in the poetry. Of the gross misconceptions prevalent both at home and abroad about the chronology of the language I have already given full proofs in the preface to my edition of the A.S. Pastoral, where it is shown that the development even of the West-Saxon dialect has been totally misunderstood.

It is painful to reflect that if Englishmen had done their duty in this matter, and the study of English had been properly supported by our great educational bodies, the work which is now being carried out at a great disadvantage by a foreigner might have been long ago done at home in a complete and satisfactory way.

The present volume contains Elfric's treatise "De Vetere et Novo Testamento," his translations of the Pentateuch and of the books of Joshua, Judges, and Job, and the Latin text at the foot of each page. The spelling is so far normalized that the long vowels and diphthongs are regularly accented, and the thorns are distributed according to Rask's rule. In the case of all other alterations the MS. reading is given at the foot of the page. In all this we think Dr. Grein has shown a sound judgment. The accents and thorns of the MSS. are hardly ever given accurately in the editions, and their restoration would not repay the trouble of collation. It is, on the other hand, to be regretted that Dr. Grein has not abandoned the *v* for *w* and *ā* for short *æ* introduced by Grimm. These arbitrary innovations were never accepted in England (except perhaps by a few servile imitators) and

Scandinavia, and are now being dropped even in Germany. We should also be glad to know Dr. Grein's reasons for retaining the long exploded instrumental in *ē* (*mid flascē*, &c.)

The critical emendations are few, the texts as given by Thwaites and de L'Isle being apparently accurate enough, and many of them are self-evident corrections of scribal or typographical errors. Some, however, of Dr. Grein's alterations we consider unnecessary, such as *answarode* for *answarode* (Exod. vi. 12)—a perfectly legitimate form; others, such as *wateru* for *watera* (Gen. viii. 1), very doubtful; others again, such as *cidhde* and *cydhdest* for *cidde* (Gen. ix. 22) and *cyddest* (Gen. xix. 19), absolutely erroneous. When Dr. Grein begins to collect references for his prose lexicon he will find that *cydde* is the regular late West-Saxon preterite of *cydhan*, and that *cydhde* is almost an archaism at this period. The plur.-pret. *hi abitan* is quite usual, and Dr. Grein's ingenious emendation *abitun* introduces into a late W.S. text a form which is archaic even in Alfredian English. We do not wish to lay too much stress on minutiae of this kind, but they are worth noticing as showing how much caution is necessary in introducing conjectural emendations even into late W.S. texts, and therefore how doubly cautious the editor must be in the case of archaic or dialectic forms.

H. SWEET.

**Mnemosyne**, Bibliotheca Philologica Batava. Scripserunt C. G. Cobet, C. M. Francken, H. van Herwerden, S. A. Naber, W. G. Pluygers, alii. Collegerunt H. T. Karsten, H. J. Polak, H. W. van der Mey. Nova Series, Vol. i., pars i. Lugduni-Batavorum. 1873.

UNDER this title begins a new period of the *Mnemosyne*, a periodical which has already lived longer than any of the similar attempts made of late years in England. Without going into the reasons of this singular contrast, which would involve us in a comparison between the scholarship of the continent and the accomplishments which pass under the same name in this country, we may point to the fact that in the preceding volumes are to be found both the *Variae lectiones* and the *Novae lectiones* of Cobet. The new part begins with an important contribution from the same illustrious scholar on the Scholia to the Odyssey. These Scholia, though much less valuable than the Scholia to the Iliad, have had the advantage of much more attention from scholars. They have been edited by Buttmann, and again by W. Dindorf (Oxonii, 1855), the last being the edition on which Cobet's annotations are composed. Of the numerous and suggestive emendations, given in an article of nearly sixty pages, it would be difficult to point to one about which there could be a doubt. It is to be hoped that the edition of the Scholia on the Iliad, promised so many years ago by W. Dindorf, will appear in time to call forth a similar commentary from Cobet. The remaining articles are:—"Varia," by W. G. Pluygers, chiefly on Catullus and Cicero's letters; "Ad Thucydidem," by H. van Herwerden, valuable notes devoted partly to suggesting emendations, partly to the equally useful task of vindicating the text against those of other scholars—the writer has made a careful comparison of Dion Cassius; "Frontoniana," by J. J. Cornelissen. There is also a short note by Cobet correcting a place in Dio Chrysostomus. Altogether the periodical is full of promise for the future of classical studies in Holland.

### Contents of the Journals.

**Hermes**, vol. vii. pt. 3, contains:—R. Hercher: On Greek prose writers. [Dio Chrysostomus, Apollodorus, Horapollo, &c.]—C. E. Geppert: Arcadius or Theodosius. [In the treatise *περι τῶνων*, first published by Barker in 1820, Arcadius merely copied an abridgement made by Theodosius from the first nineteen books of Herodian's *Καθολικὴ προσωδία*, and added a section of the Grammar of Theodosius and an abridgement of the twentieth book of the *Καθ. προσωδία* made by an unknown hand. This appears on comparing three MSS. (Matritensis, Hauniensis, and Bodleianus) which contain the abridgement of Theodosius under his name, with one (Parisiensis 2102) which has also the pieces added by Arcadius. A number of corrections are given from the Matritensis.]—O. Lüders: An artist's inscription from Athens. [*Ἀντιδίου Καλλιωνίδης ἐποίησε τὸ Δεῦλον*, found on one of the funeral monuments which were built into the wall of Themistocles.]—H. Jordan: The results of the excavations in the Forum at Rome. [Deals mainly with two points, the history of the destruction of the Forum in the Middle Ages, and that of its construction or re-arrangement by Cæsar and Augustus. The rubbish (forty feet thick) under which it has been buried is shown to consist neither of gradual deposit nor of the remains of the ancient buildings,

but of staff shot there at particular times.]—M. Haupt: Conjectanea.—Th. Mommsen: The Roman camp-cities. [Discusses the growth of municipal communities out of the permanent camps of the legions. Such camps were first formed, when the principle of a standing army was recognised, under Augustus, but the notions of "camp" and "city" were long regarded as incompatible, and the legions were not usually quartered in cities. The Pretorians were exceptional. Colonia Agrippinensis, after it received that title, ceased to be the *hiberna* of a garrison. Hence new communities soon grew up round the camps, called (from the booths erected by the camp-followers) *canabae legionis*. Two forms of government may be traced by inscriptions; one more purely military, under a *curator veteranorum et civium Romanorum qui consistunt ad canabas legionis*, another more like but still carefully distinguished from a municipal constitution, under two *magistri* (priests) and an *edilis*. The first camp which received municipal rights without the removal of the garrison was *Vetula* (Xanten), made a colony by Trajan under the name *Trajana*. Of the three quarters of the legions in Britain York was made a colony, the date unknown: the other two, Caerleon (*Castra legionis*) and Chester (*Castra*), were not: hence they never received any other names.]—L. v. Sybel: On Simonides of Amorgus. [Called forth by Ribbeck's criticism of the "Mirror of women" in the *Rh. Mus.* xx. 74.]—Miscellaneous:—C. E. Geppert: "Manuscript Emendations," and "On the Greek Grammarians."—Th. Mommsen: *Quingenta milia*. [On the use of Q or q to denote that number.]—H. Jordan: Expressions of rustic Latin. [*Aqueductum, terrimotuum*, instead of the literary *aquae ductus, terrae motus*.]

**Kenelm Chillingly: his Adventures and Opinions.** By the Author of "The Caxtons." Blackwood. 1873.

THERE is one—perhaps only one—of the criticisms which have been passed on Lord Lytton as a novelist that a candid review of his works will prove to be undeserved. He never wrote himself out. *Kenelm Chillingly* is in all respects a characteristic performance, and will leave its author's reputation unaltered for better or worse. It may be that the characters are unreal, the thought shallow, and the feeling artificial; but from the days of *Pelham* onwards Lord Lytton's works have shown a singular capacity for living through such accusations without needing to live them down. And whatever merits there were in *Pelham* are just as conspicuous in *Kenelm*. The author has kept pace with the times, and unless his public has grown more critical or is *blasé* with the number of competitors for its favour there is no reason why his last success should be less than his first. His subject is still the same, as indeed it almost always was: an affectionate satire upon a young man bent upon rising superior to the age of which he was the pride and ornament, and though never quite succeeding to his own or the author's satisfaction, covering himself with glory in the attempt. *Kenelm's* weak side, we are told in the second volume, was "a passionate longing to find ideal truth in real life." Lord Lytton's weak side was a passionate longing to find ideal truth in his own novels; and he succeeded in persuading himself that his heroes' searchings, though never presented to the imagination as successful, yet constituted the realization of his own ambition. His prefaces—with their plaintive conceit and unconvincing allegory of interpretation—are quite trustworthy as accounts of what he wished to have done, though amusingly out of proportion to what he actually did. If good intentions and capital letters could have turned the walking gentlemen of fashionable melodrama into personifications of Genius, Intellect, Will, Nature, Passion and the various other abstractions which he tried to figure to himself in earthly disguise as Maltravers, Godolphin, Darrell, Alice, Leonard, and the rest,—the prefaces would have been less absurd, as well as less indispensable; and there is no reason to doubt that these characters really repre-

sent all that Lord Lytton could represent of as much as he could apprehend of the inner nature of such ideal entities. But no great artist ever talked so much about his art, and no man of genius ever took so much trouble to describe his own distinguishing quality. The spirit of the ideal declined to grace his pages, so he tried to represent its bodily presence; but it is sufficiently obvious that a novelist who fails in idealising the men whom he had seen is not likely to succeed in personifying the ideal essences that have been always absent from his ken. Thackeray, who was not in a position to criticise his want of speculative profundity or æsthetic intuition, and evidently rather enjoyed his power as a story-teller, has said, better than any one since, all that needs to be said of the absurdities of his earlier manner and the disparity between his advertised intentions and execution. But novelists seldom err by taking too serious a view of their mission, and as Lord Lytton has a right to be tried by the standard he preferred, we will endeavour to do as much justice to *Kenelm Chillingly* as if its author had lived to denounce once more the indolence of inappreciative reviewers and interpret it himself for their confusion.

The first part of the book is rather amusing. The hero—called *Kenelm* by his father, after Sir *Kenelm Digby*, in the hope that he might grow up clever, chivalrous, and muscular, and *Chillingly* by the author, in dark allusion to the frigid influences brought to bear on the present generation—begins his career as the victim and the exponent of New Ideas. On coming of age he addresses his father's tenants with cheerfully discouraging remarks on science, morals, and political economy that prove him not only to have assimilated the most advanced views of that enlightened organ the *Londoner*, but to have reached the still higher point of esoteric wisdom at which those views themselves appear trite and unimportant. He regards the world as a sham, himself as a sham, and solaces himself by launching languid epigrams at his parents, who, having nothing better to do with him, decide that he must travel. A chance encounter with a pedestrian artist determines him to travel incognito and on foot, and the versatility of Lord Lytton's invention is shown by the skill with which he has caught the spirit of a school of fiction with which he could naturally have so little affinity as that of muscular Christianity. *Kenelm* champions two distressed damsels, sets a great

many people to rights morally and intellectually, earns two shillings at haymaking, and swears an eternal friendship with a promising farrier whom he has knocked down and crossed in love. All this is not much in the manner of Godolphin or Eugene Aram, but from the first Kenelm and all the other estimable characters have a way every now and then of talking pure Bulwer for a page or two together without the slightest reference to dramatic propriety, and as the work proceeds the foreign influence wears off, and the hero drops both his cynicism and his aggressive benevolence, retaining only a sceptical contempt for ambition and love, and a good deal of the old-fashioned Bulwer sentimentality. There is not much plot, and the *dramatis personæ* are mostly old acquaintances. The man of the world is a fashionable editor instead of a peer; the inevitable cousin and political rival, who is distinguished as usual from the true hero by more practical sense and less moral sensibility, is much less unscrupulous than in *The Caxtons* or *My Novel*, as if, in spite of the new ideas, the world had after all advanced somewhat in conscientiousness. The artist, whom we had better, if we can, regard as typifying the ideal votary of Nature, has about as much character as Vance in *What will he do with it?* Cecilia, the first heroine, is an equally shadowy figure, but that is no argument against her having been intended to represent the Real, Attainable Domestic Felicity, Practical Life with its pleasures and duties, or anything else of the same sort. As to Lily, the second and principal heroine, who converts Kenelm back from the New Ideas to a saving sense of the importance of public virtue and private happiness, it would be vain to conjecture what she was meant, or rather what she was not meant, to symbolize. She is young and childish and uncultivated; a poet, or rather "a poem," a believer in fairies, a tamer of butterflies, and a proficient in the singularly tame and empty generalities which Lord Lytton used to mistake for the metaphysics of emotion. She was the ward of the artist, who had arranged her education to his fancy, and meant to marry her as soon as he was famous and she old enough. No doubt some moral lesson or æsthetic truth was adumbrated in Lily's preference of Kenelm over Melville, and when, loving the first, she promises to marry the other from gratitude and dies consequently of consumption before the wedding, this no doubt proves that to "find ideal truth in real life" it is necessary to have loved and lost, and since further it is ideal truth in bodily shape which the hero is supposed to love and lose, it follows that for the remainder of his days he must be content with real truth, *i.e.* Cecilia Travers, the exemplary young lady whose affections he had disparaged in the first volume under the influence of New Ideas in general and the views of the Rev. Decimus Roach on celibacy in particular. In saying that Lord Lytton kept pace with the times we only mean that he was not more out of harmony with the thought of the last decade than he had always been with the serious convictions of those amongst his contemporaries who had convictions. He knew approximately what was believed by different parties, but only at second hand, and without sufficient sympathy or insight to secure him against such occasional inconsistencies as this of making Kenelm reinforce the counsels of worldly wisdom learnt in literary London society by the spiritual precepts of an advanced Oxford Anglican on the "Approach to Angels." So industrious a workman ought to have known better than to confound Lord Bantam with Lothair. Similarly we are at a loss to recognise any known forms of "German æsthetic philosophy" in the cheerful morality which impresses Kenelm so much in the mouth of a country clergyman's wife as to mark the turning point in his conversion from the New Ideas, and especially from one of the most

highly esteemed amongst them, the "Not-worth-while Idea," which he had hitherto "made the basis of his philosophical system." The general conclusion at which he arrives is that it *is* worth while first to fall in love—either with the Ideal or the Real, as Providence may dispose—and secondly, and most emphatically, that it *is* worth while to become an enlightened Conservative member of the House of Commons. To complete the account of his "adventures and opinions" we should perhaps add that he valued churches because their bells, heard from outside, remind him that it is possible to believe "that Nature has a God and man has a life hereafter;" and that after having been introduced to us as "this strange man who surveyed the objects and pursuits of his fellows with a yearning desire to share them," murmuring to himself, "I cannot—I do not stand in this world; like a ghost I glide beside it and look on"—he is made in the last chapter to confess and resolve: "We must go through the romance of life before we clearly detect what is grand in its realities. I can no longer lament that I stand estranged from the objects and pursuits of my race. I have learned how much I have with them in common . . . My choice is made. Not that of deserter, that of soldier in the ranks."

After this it will scarcely be denied that Lord Lytton's mind preserved its youth to the last. Leaving out the disquisitions, *Kenelm Chillingly* would be a fair average story of fashionable life, rather slight in structure, but pleasantly written. But Lord Lytton's novels without the disquisitions would certainly be the play of *Hamlet* with Hamlet left out. The disquisitions are the hero and the hero is the author. It used to be said that the age of both varied together, and nominally perhaps this was true, but really time stood still, alike with the author and his characters, who, whether introduced first as of mature years, or supposed to pass from youth to middle age under our eyes, were in practice always the same ageless, colourless mouthpiece of the same sterile worship of the ideal; there was something touching in the earnest pertinacity which erected so many altars to the Unknown God, Genius, but since the God chose to remain unknown, a wiser worshipper would not have affected the mien of an initiated priest of his mysteries. This admixture of personal vanity made critics of the serious sort less indulgent to his failures than perhaps the laudable height of his aims gave him a right to expect; but on the other hand his popularity with the uncritical public was too considerable to make it easy to regard him as an object of pity—except for praise withheld, which could not honestly be given. Yet popularity so wide and sustained is a sign of some kind of power, and future historians of literature will be interested in the question what the power was that left its owner in such Egyptian darkness respecting its true nature and extent. It is generally admitted that his works might be so divided amongst half-a-dozen writers as to have furnished as many creditable third-rate reputations, and it is argued by some that several third-rate reputations together must be the equivalent of at least one second; and so far as the man himself is concerned this may be true, but it is not enough to secure even second-rate fame for his best works, while it is certainly hard that a writer who put so much of himself into his books should have most chance of being remembered if they are forgotten. Lord Lytton was an exceedingly clever writer, and it is perhaps within the bounds of possibility that under more favourable circumstances the same amount of cleverness might have produced a smaller quantity of better work; of ability unattached, merely literary cleverness, he possessed an abundant supply, and these gifts are scarcely distinguishable from original power of an inferior kind in ages possessing fixed traditions, classical models, and definite literary ideals. But in the

absence of any original, spontaneous impulse or creative power he could do nothing, in an age of literary individualism, but compile and invent with dexterity enough to deceive the unwary and himself. He believed that his place was amongst the foremost of contemporary writers, but he could not advance in any direction himself, much less lead others, until he had determined whither; and this question, which is scarcely settled in *Kenelm Chillingly*, was certainly not settled in his earlier works.

The style of composition to which he was naturally most inclined seems to have been the old-fashioned florid romance, in which—to borrow his own criticism on Byron—sentiment is painted nearly as strongly as if it were passion, while the interest is sustained by an assortment of crimes, perils, and misfortunes of approved melodramatic types. In *Falkland* the tendency was unrestrained: in *Pelham* there is a subsidiary plot of the same order, though the success of the book was owing to the cleverness, then new, of its social satire. The motive in compositions of this school is generally a passion much too mysteriously profound to have its origin described within the compass of the work: it is usually something tragical connected with women—vengeance for some ancient wrong, a sacred vow, or something equally elastic and remote from ordinary experience. Even in *My Novel* and *What will he do with it?* the old heaven is nearly as active as in *Godolphin* or *Pelham*. In this respect Bulwer was always rather behind the taste of the ordinary educated public, but though he could not altogether reform, he tried to amend, especially after the warning conveyed in Thackeray's parody and Jeames' letter. What he wrote in this vein could not possibly have been written by a man of genius except in his teens, scarcely even by a man of talent unless he had mistaken his vocation; it was justly fatal to him with the critics, and was a serious weight on his general popularity.

It was probably a sense of something wanting to complete his success in the romance of incident, character, and passion that made Bulwer turn his attention to the capital to be made out of theories of art and morality. The person and adventures of the conventional hero were to derive profounder significance from association with a few windy propositions about the life of the soul and the influences of the universe; while the plot of the story was to be dignified by conveying some social doctrine or speculative opinion. In the first innovation, which has been referred to already, Bulwer to some extent followed a German tendency, which his writings have since helped to strengthen; but he was less sincere than his models and less ingenious than his imitators. When writers of the school of Tieck and Novalis turned romance into allegory the hidden meaning was really what the romance was written to convey; with Bulwer it was an after-thought, or at best the two were invented together; later Germans, like Auerbach—we are of course speaking of his novels, not his *Village Tales*—though they may not have a much clearer purpose than we have traced in *Kenelm Chillingly*, still follow a different plan in trying to give artificial force to its expression. They contemplate a platitude till it swells, to the eye of sentiment, into an object of enthusiasm, where Bulwer used rather to take for granted a commonplace sentiment and then extract or append the nearest approach to a recondite reflection which occurred to him; but in any case it is a defect in a work of fiction for the author to have to appear as his own chorus. This Lord Lytton never felt, and since in 1851 he placed *Ernest Maltravers* and *Alice* in the first rank amongst his works, expressly on account of the moral—the hero, Genius, in love with Nature, bereaved of her presence, and finally re-united to her chastened and refined, &c.—we are

certainly justified in believing his title to immortality to be as slender as several allegorized melodramas can make it. But then Lord Lytton was not always exclusively himself. In 1845 he claimed to have "served as a guide to later and abler writers," and though he had a considerable talent for free imitation, it is also true that he sometimes "followed before" public opinion, in directions which led less versatile and more earnest writers to assured distinction. Of his contemporaries Disraeli certainly owed him nothing, whereas the influence of *Vivian Grey* is plain in *Godolphin*, which owed its success to the fresh element of politics, though decidedly inferior to *Pelham*, for the author was far less master of the philosophy of party warfare and intrigue than of the laws of fashion and social success. But *Paul Clifford* and *Eugene Aram* were written respectively eight and six years before *Oliver Twist*, and inexplicable as their vogue seems to us now, they must have had some influence in bridging the interval that separated objective admiration for the gallant highwayman from the more searching sympathy that makes society responsible for his offences against itself. It is thus far from true that his reputation suffered through his advocacy of unpopular views; only as the views seemed rather to eke out his invention than to inspire or direct it they did not procure him a reflected popularity. When Dickens set to work to abolish beadles, or Thackeray to exterminate snobs, they were not only possessed with a conviction that those ends were supremely desirable, but they had also an unusually keen insight into the nature of beadles and snobs which enabled them to set a living picture of their undesirableness before their readers' imagination. But in *Night and Morning* for instance, which we are told was meant for an attack on respectable vice, the respectable villains differ in no way from those of more modest writers, whose villainy is subordinate to the exigencies of a plot intended merely to amuse an idle hour.

In historical romance Lord Lytton certainly distanced G. P. R. James and Ainsworth, but the day of the historical romance, as an independent form of art, was over as soon as it had served the purpose of re-awakening interest in the romance of history; if *The Last Days of Pompeii* and *Rienzi* were to live it would have to be for the sake of the fiction, not for the background of foundation in fact. In *The Caxtons*, in which he seemed to have struck out an entirely new line, there are traces of Thackeray's influence, besides the obvious imitation of Sterne; but he was too fertile a writer, or, at least, borrowed too little at a time and from too many quarters at once, for the charge of plagiarism to be worth pressing. The want of originality, which includes all his other shortcomings, compelled him to be always on the look-out for suggestions and materials ready digested for use, but his skill in following out and re-arranging these really left nothing to be desired. We have seen in *Kenelm Chillingly* that he could take a hint from the school of muscular Christianity; in *The Parisians*, now appearing in *Blackwood*, it seems that he was not too proud to borrow from some recently published sketches of French society a new framework in which to set his moral dissertations upon art, pedigree, the stage, the vocation of woman, &c. Internal evidence, though the two works were published within a short time of each other, would also seem to suggest an obligation to Hawthorne for part of the conception of Margrave in *A Strange Story*, the mention of which brings us to the last, and not the least characteristic class of his writings—those in which he deals with the supernatural. It is intelligible enough that an author who was always seeking for stronger forces than such natural passions as he could apprehend or represent should have been attracted by the thought of mysterious agencies that could be

described by negatives, and might be explained away or not at will. He begins to trifle with the notion in *Falkland*; there are astrologers in several of his early works, and *Zanoni* is full of the Elixir of Life, which mingles in *A Strange Story* with mesmerism, theories of madness, and very random attempts to distinguish the separate lives of body, soul, and mind. As a short cut to sensational effects the trick is harmless enough, and when, as in Hawthorne, the imagination is satisfied by a kind of fantastic logic and coherency in the ideal creation—trick is hardly the word to use. But with Lord Lytton the magic was always mechanical, and the horrors those of an ordinary ghost story, to which the reader's nerves have to supply the chief contribution; while his sympathetic curiosity, always verging towards credulity, touching speculations of this kind, makes his judgment show to as little advantage as his imagination. In *The Coming Race*, which was pure fairy tale, his skill in taking hints from semi-scientific possibilities showed to greater advantage, and indeed but for the triviality of the political criticisms we should be inclined to call this his most original work. On the weightier matters of faith and philosophy its conclusions harmonize with those in which Kenelm seems intended to rest; for the probable discontent of mortals transported into *Vrilya* implies that what makes life on earth tolerable is its faults, which are ours.

If we seem thus far to have taken Lord Lytton's claims to consideration too much *au sérieux*, it can only be said that morality is a more serious matter than art, and that though he was certainly but an indifferent artist, he yet succeeded in luring so many thousand readers through so many pages of vapid moralization as to make his moral theories a matter of some consequence. The power by which he did so we conceive to have been the simple charm of commonplace. He was never weary of making sententious reflections of the kind that look profound to people who are not in the habit of reflecting for themselves; his sentences, naturally, were either true or false; if they were true, it was hard to prove that they were not worth stating so long as there were people who found them new and impressive; if they were false it seemed arrogant merely to say so without offering any reasons for the opinion, yet it would have been a waste of good mental energy, akin to that which we deplore in the author, to discuss each various occasion in which a small error takes the place of a smaller truth in discussions which are radically trivial and unproductive. The mind of man "works upon stuff": Lord Lytton was an indefatigable worker, and his mind was always active, but "stuff" was wanting, or rather it was there in abundant mass, but strangely thin and innutritious as to quality. After all, criticism of Lord Lytton is far rather criticism of the public taste which he always almost satisfied: his life and writings are at least valuable as illustrations of the truth that even when the two pursuits—of the Ideal and a tomb in Westminster Abbey—are followed with equal devotion by the same person, success in one is neither a consequence nor a guarantee of success in the other.

EDITH SIMCOX.

#### THE NUT-BROWN MAID.

To the Editor of the ACADEMY.

22nd April, 1873.

SIR,—Mr. Purves has overlooked a strong difficulty when he makes the last stanza a woman's, instead of the author's, as I made it in the Percy Folio; and that is, that the speaker prays God that "*we* [*i.e.* we men] may be comfortable" to women. No doubt Mr. Purves can get out of the difficulty by reading "ye" for "we"; but this would force the plain meaning of the lines to fit the fancy that because the stanza ends with "alone" it must be a woman's,

The dialogue ends with the Knight's promise to marry his Nutbrown Mayde (l. 348); and then in the concluding stanza the author sums up the moral of his charming tale, and speaks of himself and his fellow-men as "*we*."

F. J. FURNIVALL.

#### Notes and Intelligence.

The *Revue des deux Mondes* and the *Edinburgh Review* contain articles on the political romance *Um Scepter und Kronen*, which, though beneath criticism as a literary work, has excited much attention in Germany, owing to its subject, the war of Sadowa, and the calm audacity with which illustrious personages are brought upon the stage in it. The author, who uses the pseudonym Samarow, is reported to be one of the actors in the romance, Herr Meding, at that time Hanoverian *Regierungsrath*, whence his opportunities for acquiring information not generally accessible to private persons, as to how "under the influence of beer and Beethoven" (as the English reviewer puts it) "Prince Bismarck resolved to attack the Austrian Empire," and what astonishing nonsense defeated kings and emperors talk to their confidential advisers. The book is curious, because so far as there is any attempt to save decorum it consists, contrary to all former precedents, in making real personages do and say much that is imaginary, instead of masking indiscreet revelations by the use of fictitious names. The same (April) number of the *Edinburgh* contains a notice of Mr. Darwin's book on Expression, in which the weak sides of the weaker sectarians of Evolution are well pointed out, though the doctrine itself is partly undervalued and partly misunderstood.

In the *Allgemeine Zeitung* (Ap. 22, 23) there is an interesting account of the voluminous and unpublished Memoirs left by Christian v. Mannlich, director of the Munich Gallery, who died in 1822. The original MS. fills four large folios, and a copy taken by order of King Louis I. of Bavaria, and placed in the public library of Munich, is accessible to students. The author was born at Strasburg in 1740, spent much time in Paris, which accounts for the fact that his Memoirs are written in French and in a lively manner, proceeded to Rome in 1767, carrying with him Boucher's advice to study Albani and Guido, not Raphael, who in spite of his fame was *un peintre bien triste*, nor the terrible Michel Angelo; he afterwards studied under Mengs at Florence. Mixed up with diffuse private reminiscences are many anecdotes of literary, social, and even historical interest.

Karl Hillebrand writes to the same journal to state that he had been invited to examine the literary remains of the Countess Guiccioli, now in the possession of Count Gamba's family. They include a work on "Byron's residence in Italy," which contains unpublished letters and other contemporary memoranda, several autograph MSS. of Lord Byron's—of *Marino Falieri*, parts of *Don Juan*, the *Prophecy of Dante*, &c., and what is of more importance, an extensive correspondence belonging to the years 1820-1823, which however "is not very well suited for publication."

M. Saint Marc Girardin, whose death was announced last week, was equally active as a professor, a moderate liberal politician, and a *littérateur*. Besides frequent contributions to the *Revue des deux Mondes* and the *Journal des Débats*, his best known works are *Essais de littérature et de morale* (1844) and *La Fontaine et les fabulistes*, published in 1867. He succeeded Sainte Beuve as editor of the *Journal des Savants*.

At the Pultowa Observatory at St. Petersburg an old book (printed 1531) has been discovered, in which Copernicus, to whom it formerly belonged, had written marginal notes, partly astronomical, partly autobiographical, and placed temporarily at the disposal of the Copernicus Society of Thorn.

A new geographical journal, *Cosmos*, edited by Guido Cora, has been founded at Turin, and introduced with a preface by Dr. Petermann; the first number contains an article on Recent Expeditions to New Guinea, one entitled *Il Tangani-*

*lia, bacino chiuso*, and a third on the Russian possessions in North and Central Asia. Another new publication, *Storia dei viaggiatori italiani*, by Gaetano Branca, is intended to revive the memory of what Italy has already done in geographical discovery, and to stimulate the rising generation to deeds worthy of their ancestors.

Jerne of Armorica, the heroine of the new volume of the Quarterly Series, was, it seems, the daughter of Christian parents, but brought up to be a priestess of Ceridwen, and much impressed by Druidical metaphysics, which were surprisingly like those of Christianity. She had the good fortune to be captured by Clovis and placed in a convent at Soissons, whence she is carried off, still half converted, and after being rescued and betrayed a good deal finally converts her countrymen by being baptised after she has been stabbed by the archdruid to prevent her being rescued again. She appears to her lover as a white hart of the feminine gender to indicate a ford by which Clovis can make his way to engage the Arian Alaric. Her lover is killed in the battle, and Clovis and Saint Clotilde are crowned emperor and empress of Gaul at Tours after the victory. The author has taken a good deal of pains to collect antiquarian information from all sorts of authorities from Mallet to Gibbon and Villemarque; but the manners of the book are an odd medley of modern Roman Catholic Pietism and the imaginary chivalry of the Middle Ages; it would have been better to make the Franks speak the language of the Norse Sagas if it was impossible to construct a credible dialect for them out of the scanty indications given by Gregory of Tours.

The opening number of the new volume of the *Svensk Tidsskrift för Literatur, Politik och Ekonomi*, contains an interesting paper on the poet Olof von Dalin (1708-1763), the Swedish Boileau, who sang the praises of Queen Louisa Ulrika's court ladies, and wrote long didactic poems in alexandrines. The chief novelty in the criticism is the clever attempt to prove that though Dalin bowed before the French taste of the time, the real sources of his inspiration were the works of contemporary English writers. His famous literary journal, *Argus*, is shown to have been moulded on the plan of the "Spectator," and passages ingeniously imitative of Pope, Swift, Addison, and Steele are pointed out. Perhaps the most interesting idea is that Dalin's most famous poem, *Svenska Friheten*, "Swedish Liberty," was altogether inspired and suggested by a passage in the fourth book of Thomson's forgotten epic, "Liberty," a passage that celebrates Scandinavian prowess in the accepted manner of the age. In the remaining words of his essay the reviewer recapitulates the widely differing judgments which successive generations have passed upon Dalin's work, and exhorts the present one not to forget how much he did to build up a national literature in Sweden.

The question occurs to us, What would Dalin, or, to come a little nearer to our own times, what would Atterbom or Hammarsköld think of the literary condition of Sweden to-day? In all Scandinavia the *Svensk Tidsskrift* is the only first-rate magazine that is being published. What literary life there is in Sweden seems to have flitted from Stockholm and Upsala to Finland. It is to Helsingfors, it seems, that we are to look for scholarship and poetry! The *Svensk Tidsskrift* itself is far from being satisfactory; with the exception of the one paper we have cited, the whole number is heavy and dreary beyond expression.

In the April number of the *Preussische Jahrbücher* Theodor Lindner examines all the authorities for the legend of Charlemagne's entombment; after referring to the silence of all contemporary or well-informed writers as to anything unusual in the Emperor's burial, and to Thietmar's chronicle (1012) in which the opening of his grave by Otto I. is described without any miraculous adjuncts, he inclines to trace the origin of the myth which afterwards became current to the invention of Otto, Count of Comello, who is quoted in the chronicle of the Monastery of Novalesse, in the valley of Susa (1048), as giving on his own authority, as an eye-witness, an account of what was found in the tomb when opened by Otto III. The only difficulty is that the same legend was known to a French chronicler, Adhèmar (1000), who might have got the story from Novalesse, but there is no evidence to show that he did. The same journal contains a readable article on Mirabeau, by K. Mendelssohn Bartholdy, dealing chiefly with the romantic interest of his life and character.

## Art and Archaeology.

*Histoire de la Céramique.* Par Albert Jacquemart. Paris. 1873.

THIS volume is perhaps the most comprehensive that has been yet written on the ceramic art. Starting with the axiom of a French writer that "the history of pottery is the history of humanity," M. Albert Jacquemart, after having first laid down the great divisions of pottery as established by Brogniart, proceeds to review in succession the fabrics of all the great civilizations of the universe, seeking rather to trace the historic influences or moral causes which have modified the ideas of the artists and the style of their works, than the improvements which science has made in their mode of fabrication.

In this philosophic study our learned author sets before his reader all in his subject that can interest the general as well as the special inquirer, through the course of ages to the present time. He begins with Egypt, where, contrary to the usual order of things, instead of a coarse pottery with rude attempts at ornament with zigzag lines or concentric circles, we find a porcelain of a beautiful turquoise blue, "scarcely rivalled after thirty centuries of human experience;" modelled as carefully as a jewel, and sometimes heightened with an enamel of fine workmanship. Of such are the objects found in the tomb of the Egyptian Queen Aah-Hotep, contemporary of Joseph, and our museums swarm with real ceramic masterpieces, representing the symbols of Egyptian worship, statuettes, lamps and vases ornamented with the symbolic lotus, or the scarabæus, with extended wings, emblem of the sun and immortality.

Hebrew art was a branch of the Egyptian, modified by the injunctions against images as leading to idolatry. A fragment now in the Louvre shows that the Hebrews used a siliceous earth enamelled with blue for cups, amphora, and lamps. Subjects from the vegetable kingdom formed the decoration of their vases, and the iconoclastic tendencies of this pastoral race were no doubt transmitted to the neighbouring nations, and rendered still narrower by the restrictions of Islamism, formed the basis of Arabian art and its exuberant floral ornament.

Passing next to the extreme East, for which M. Jacquemart shows a decided predilection, we have a most animated and interesting chapter upon China, its mixed theogonies, the one leading to all the extravagancies of superstition, the other purely philosophic; the government, language, and manners of the Chinese, their colours entirely symbolic, presenting a signification either political or religious. All these are intimately connected with the origin and development of their ceramic art, which can only be studied as associated with them.

Japan, as regards art, is superior to China, and among its products we find the great masterpieces of oriental ceramic art; but, as M. Jacquemart indignantly exclaims, since the opening of the country to European intercourse, we must confess that in point of art Japan no longer exists; it modifies its taste to conform to ours, and sends us in place of its former charming productions, the inspirations of native genius, odious imitations of our manufactures—inevitable result of our contact with oriental nations. Where is this more strongly exemplified than in the modern shawls of Cashmere, all made under French teaching?

Assyria and Babylon with their enamelled tiles next follow; then Syria and the products of Damascus, the votive lamps of faïence and glass, and the rude "gey-cham" of Asia Minor. In the next chapter upon Persia, its pottery and porcelain, M. Jacquemart again launches forth on the history and manners of the country, the doctrines of Zoroaster, the good and evil genii Ormuzd and Ahriman, the fabulous animals, &c., all as in connection with ceramic works. His

ideas on Persian hard porcelain and on the products of India are not generally accepted.

The pottery of the Magreb or Barbary States, till lately so little known, is fully described; urns of almost classic form, vases with three handles, bearing a strong resemblance to those of the Hispano-Arabian, showing one common derivation. They are covered with a polychrome decoration, in which the tints are most harmoniously blended.

The unrivalled forms of Greek pottery have never been surpassed. To beauty of outline is added a severe simplicity of decoration, in which colour is made subservient to form, and an elegance of composition, raising to the highest standard of art the coarsest materials applied only to vulgar uses.

With the brilliant historic period of the Renaissance we have the enamelled pottery of Italy, the marvellous works of Luca della Robbia, and the fabrics of the hill cities of Romagna, their compositions the reflex of contemporary painting in Italy, the princes of each little court as much occupied in the manufacture as the artists themselves.

M. Jacquemart descants largely on the pottery of France, which country has created more decorative kinds of pottery than any other in Europe. Bernard Palissy, the ceramic hero of the sixteenth century, "the eloquent personification of the French taste of his period;" the mysterious products of Oiron, with the varied products of Rouen, Nevers, Moustiers, with Sèvres as the crowning work, show what ceramic successes France has achieved.

We will not follow M. Jacquemart to modern times, where each manufacture is fully described. The whole is most carefully and conscientiously written. The work is profusely illustrated with woodcuts, and twelve admirable aquafortis engravings by M. Jules Jacquemart. Father and son seem animated with the same feeling for art, the draughtsman interpreting the thoughts of the writer, each illustrating the other.

M. Jacquemart's ideas on some points may be fanciful, but they will always command attention as the result of many years' study of the subject; and containing so extensive a history of all ages and all countries, his book forms a complete grammar of the potter's art. F. PALLISER.

#### THE CASTELLANI COLLECTION.

By the arrival within the last few days of four very precious painted vases the final charm would appear to have been added to that series of artistic remains collected by Signor Castellani here and there among the sites of ancient Greek, Etruscan, and Roman civilization, and now deposited in the British Museum. As the collection now stands, therefore, so must it be judged, leaving only a narrow margin for what is still in Rome, and remembering that whereas it now constitutes a most choice epitome of ancient art, it would necessarily, if acquired for the British Museum, be distributed, and each particular object called upon to sustain a severe comparison. In this event, no doubt, some would suffer and many gain greatly. On the other hand, there is a class of monuments which, by combining historical with artistic importance, admit of no comparison, every addition of this kind to a public institution being a positive and direct gain to knowledge. Of this nature is one of the recent arrivals, a vase on which is painted the scene at the institution of the Eleusinian Mysteries, recalling vividly the Homeric Hymn to Demeter. The names of the persons engaged in the ceremony are inscribed beside each. The central place is occupied by *Triptolemos* (so written) seated in the winged car presented to him on the occasion by Demeter, with the injunction to travel through all lands for the purpose of teaching mankind to cultivate grain. Behind him stands *Demetre* holding a torch and ears of wheat. Before him stands *Persephone*, here called *Pherophatta*—a more ancient form of the name, from which her sanctuary in Athens was styled *Pherrephattion*. Behind her is a female figure, named *Eleusis*, a personification of the locality, and behind her again is seated *Eumolpos*, who was said to have been the first Hierophant at Eleusis, and in

whose family that office always remained. On the other side of the vase are the deities *Zeus*, *Poseidon*, *Anphitrite*, and *Dionysos*. Another object of importance in the study of ancient religion is the bronze tablet, known as the *tavola d'Agnone*, from the place where it was found near Bovianum, with a long inscription in the Oscan language ordaining, according to the interpretation of Mommsen (*Die Unteritalische Dialekte*, p. 128), festival days for the various Samnite deities whose names even in many cases would without this tablet be unknown. For the study of the Oscan language it has another and a very considerable importance.

For the variety of interest which it awakens there is, however, no monument in the collection so conspicuous as the terracotta sarcophagus which once under the ground of the ancient Caere contained the body of *Tannia Unatia*, the daughter or it may be the wife of *Velius Matinius*. In either case she must not have been over four and a half feet high. Reclining on a couch formed by the lid is an old man, whose nude body and limbs have given the sculptor every opportunity of expressing the spareness and wasting of age. By his side is a lady with whom he is engaged in lively conversation. To judge from her dress and ornaments she must have been a person of station. The four sides of the sarcophagus are sculptured with figures in low flat relief, the subject on the front being a combat which, if it be mythical, may be described as that between Achilles and Memnon. The hero to whom the encounter is fatal would be Memnon; while the women who stand looking on from either side would be, as frequently on vases, the mothers of the two heroes, Thetis and Eos, each with a female attendant. Who the two men may be who also look on as partisans we do not know; but there can be no doubt that the graceful winged figures at either extremity of the scene represent the Fates or souls of the two combatants, such beings as those which Zeus, to be impartial when Thetis and Eos implored him each to save her son's life, placed in his balance, holding it while the combat lasted. The soul of Achilles trips from a portal lightly on the scene, but that of Memnon bounds away. On the head of the sarcophagus is sorrow and wailing on the part of two couples who sit facing each other leaning their heads on their hands. On the foot are two warriors, probably again Achilles and Memnon, taking leave of Thetis and Eos, each with her female companion. On the back are a man and wife reclining on a couch, surrounded by female attendants and all the apparatus of a feast.

From an artistic point of view these reliefs present a striking contrast to the figures on the lid in this respect that while in the former formality and a certain manner of gracefulness are supreme, in the latter the utmost devotion appears to have been paid to the production of truthful copies from nature, however ungainly they might be. In the reliefs the female figures compare very well with some that are to be found on the early vases, and particularly with the figure of Athene on the Burgon Panathenaic vase, in which the same shortness and breadth, precisely the same drapery with its broad borders, the same facial angles, and the same smallness of head are recognisable. The male figures are also of this short, thick type for which the name of Old Doric has been suggested by their resemblance in this respect to the columns of the early Doric architecture. The artist has had to render a mythical subject and he treats it in the traditional manner in which he finds it handed down. But in the figures in the round on the lid his task has been one of portraiture, in which he has been scrupulous to be exact. The fact of his extraordinary success, however, requires some explanation. It may be that the art of sculpture in relief had from long practice before his time come to be bound down to certain traditions of style, while sculpture in the round is to be regarded as then possessed of all the vigour and force of a new and youthful art. In support of this explanation we might point on the one hand to the frequent mannerisms of the later Assyrian reliefs as compared with the earlier, and on the other hand to the extreme scarcity and rudeness of Assyrian sculptures in the round as a proof that the latter phase of art followed the former at a long distance. Similarly in the history of Greek art we find sculpture in the round coming first into practice, and then in some cases as portraiture, about the seventh century B.C., while sculpture in relief is known to have been practised by the Greeks centuries before that date.

On the front of the sarcophagus is inscribed :—

(1)

ΑΙΙΙΧΙΖΙΝΤΕ[Α]ΕΕΕΜΜΑΥΜΕΕΑΥΕΕΙΜ

(2)

ΑΤΑΥΥΙΑΥΙΤΑΥΙΑΥΕΕΑΥΑΘ

That is, reading from right to left, (1) *Mi Vela Vesnas me vepe Tursi kipa*, and (2) *Thania Velai Matinai Unata*. The letters are obviously early Greek, and, so far as they go, closely resemble the Greek alphabet found written on a vase from Caere now in the Museum Gregorianum in Rome. The date is not determinable, but so much may be gathered from the presence of two forms of *ς*, that the inscription belongs to a period when the Greek alphabet had not yet dismissed the Phœnician element of a double form of sibilant. With regard to the interpretation this is not a time to be venturesome when any day may bring a book of Corssen's containing the promised revelation on the language or languages in use in Etruria. There is, however, in the Campana collection of the Louvre an Etruscan fibula of gold found at Clusium (Chiusi) and bearing an inscription in which the same formula, the same forms of letters, and for the greater part the same names occur. If it has been rightly interpreted (*Bulletino d. Inst. Arch. Rom.* 1851, p. 46) there will be no difficulty in reading our inscription as a form of Greek *eimi Feliou Finnioi. me fepoiei Tuskos kipios*; the fibula was the work of this same Tuscan artist Cipius and belonged to one of the family of Velius Vinnius.

Among the objects of a peculiarly Italian character in the Castellani collection are four terracotta figures of actors found in Campania and representing the Pappus or Pantaloon, the Maccus or Glutton, and the Bucco or Clown of the old *fabulae Atellanæ* which were introduced into Rome from Campania in the year 450 A.U.C., and still exist in the Italian Punchinello. The fourth character is a thief who protests that he has not stolen a purse, the corner of which he will be dismayed to find is visible under his mantle.

Turning now to the monuments the merits of which rest on their beauty alone, it is difficult to know where to begin; whether to approach first that singularly monumental bronze head of Aphrodite which looks so fair and has the illumination in its features which transcends all the expression of mortals, or whether to take the marble head of Hera, chaste and refined to the borders of severity, as became the somewhat cold but still the noblest of goddesses. Her lips have been spoiled of their curving lines by polishing, but traces enough remain to show that they must almost have rivalled in delicacy those of the bronze head. Her massive chin, like the chins on the coins of Sicily, reminds us that the marble was found at Agrigentum. But instead of the Sicilian nose, which on the early coins is remarkably short, and even in the best is by no means too long, the nose of Hera is unusually prolonged and lends a peculiarly restrained or rather chastened expression to the face. Then again there is the bronze relief of a young hero from Tarentum, which has been compared with the Theseus of the Parthenon for the simple grandeur of its forms. But the face is too animated for Pheidias, and the sense of physical strength in the neck and head too pronounced. *Gloria Lysippi est animosa effingere signa* (Propert. iii. 7, 9), and were it not that we have been led to expect nothing so noble from Lysippos we should trace this figure to his school, which must have flourished greatly in Tarentum. We must pass over the most graceful of bronze strigils, the rhyton from wealthy Capua, and many other objects tempting by their beauty or their historical importance. A. J. MURRAY.

#### PUBLIC WORKS AND ANTIQUITIES IN ROME.

THE manner in which authorities pursue antiquarian undertakings at present in Rome is not less contrasted with former proceedings in that range than is the constitutional monarchy itself with the theocracy which has yielded place to it. Between two and three years have passed since that great change; yet still are the older quarters of this city left in their old conditions, with narrow, gloomy streets, ill-paved and uncleanly as before, their dismal palazzi and huge convents looking as dull and

dilapidated as ever. But when we quit the lower for the higher regions we find on the heights of the Quirinal and Esquiline Hills the new Rome rapidly springing up, with handsome rectilinear and symmetric streets, large and imposing mansions, a general air of cheerfulness and superior civilization—the genius of the nineteenth century, in fact, confronting the mediæval and sixteenth century metropolis so little improved during the ages of pontifical dominion—though (it is fair to add) much embellished under Pius IX. At some spots the scene, in the transitional circumstances, is curiously picturesque. Where once were in view only solitary fields, neglected gardens, squalid cottages, with here and there a grey old villa amidst enclosures and ilex-trees, the surroundings all rural though actually within the civic walls and towered gateways, the eye now perceives on every side the signs and consequences of this wide-spreading innovation—the activities of the mason and the builder breaking up the ground and intersecting it with long lines of foundation-walls, or passes where walls are to arise, or habitations near to completeness: the residences of faded aristocracy or once wealthy prelates are dragged into view by the throwing down of their enclosures or uprooting of their gardens—the metamorphosis thus effected around them being itself an apt symbol of the decline of the Past before the ascendant Present in Rome. On those higher grounds of the classic hills almost all available spaces have been purchased by building companies; and by the beginning of last winter 2,000 new houses were commenced. Though the law for suppressing monasteries and convents has not yet been enforced here, almost all such establishments are now appropriated in part for secular uses—for the school, the barrack, or the ministerial office; the great “Collegio Romano” of the Jesuits contains the Gymnasium and Lyceum, under government control; the Minerva Convent of the Dominicans, where the Inquisition held its sessions, serves for political purposes; and cavalry soldiers intrude upon the ascetic solitude of the Carthusians in the cloisters built by Michelangelo among the ruins of Diocletian's Thermae. In January last appeared an edict for the expropriation of sixteen convents or other monastic properties at one blow. The newly appointed Commission of Antiquities, to which the Government assigned a subvention of 300,000 francs per annum, comprises six assessors; and an engineer (Signor Lanciani, himself a learned archæologist) is now engaged in the service of the municipality to report to those magistrates once a week all things found in the range of the antique. Nothing of this character can be sold or removed till after such report, and after sanction obtained for so disposing of such objects. The earliest adopted projects of the Commission were: the uniting of all grounds on the Palatine Hill in a single estate for the furtherance of the *scavi* over the entire extent; the reducing of the Forum to its ancient level, and the opening of the (for the most part buried) Via Sacra as far as the Coliseum; the purchase and working of the Forum of Augustus; the complete disencumbering of the Antonine Thermae, and reduction to their ancient level of the halls and palestra throughout those vast ruins; the formation of a museum, to contain all the more valuable specimens of architecture in fragmentary state located in the long deserted chambers of the Tabularium, above whose ancient structures stands the modern Capitoline Palace. External to the city the principal undertakings resolved on, and soon commenced, were the purchase of the ruins of the Tiburtine Villa of Hadrian for *scavi* over their whole extent; and the resuming of the works at Ostia, commenced in 1855 by the late Government.

Among less important, though in some instances noteworthy, discoveries are those of numerous mansions, more or less decorated with painted walls, mosaic pavements, &c. Such have been brought to light amidst the earth-heaps accumulated against the agger of Servius Tullius, on the premises of the central railway station, together with many courses of massive stone-work, which must have fenced the earth-works of that agger on both sides. Similar remains brought to view by the cutting of the agger, unfortunately necessitated for the building of a great ministerial palazzo near the Porta Pia, have been swept away; amidst heaped up soil and new foundation-walls in a once solitary valley between the Viminal and Esquiline, overlooked by the cupolas and campanile, grandly conspicuous on the latter hill-summit, of S. Maria Maggiore, the remains of a mansion lately laid open attest the most aristocratic character; but the painted walls, the mosaic pavements, the

open court with a marble-encrusted fountain at one side, have all been again consigned to earth and oblivion through the utilitarian demands of proprietors or builders for the site occupied. There was something affecting in this brief glimpse of olden splendour so soon to be again buried as during ages past. So many ruins of more or less conspicuous mansions have been discovered on the grounds near the eastern line of walls where the Quirinal, Esquiline, and Viminal gradually converge to a wide plateau, that we may infer the anciently aristocratic character of this entire region. Here is supposed to have stood (near the railway station) the villa of Mæcenas, within which demesne the ashes of Horace had sepulture (would that the spot were recognisable!)—allowed an honourable tomb on the estate of his beneficent friend. Most of the ancient houses, lately found in long-buried ruin, seem of about the period of Hadrian or the Antonine Emperors. Some partition walls with paintings in good style—Europa carried away by the bull, and a voluptuous love scene, &c.—within a private estate near that part of the Thermæ of Titus called “Sette Sale,” must pertain to the buildings of the baths founded by that emperor and added to by Trajan on the Esquiline. Next to the precious fragments of marble architecture on the Palatine and Forum, the finest relic of the antique in that class lately found is a colossal and exquisitely wrought pediment with frieze and Corinthian mouldings, the brackets supporting eagles which grasp thunderbolts in their talons, like those in the details of the Portico of Octavius; this new treasure-trove being laid at little depth beneath the surface of grounds near the side platform of the Prætorian Camp, still surrounded on three sides by its old fortifications.

More valuable art-works, sculptures, are dug up from time to time. Among the latter I may mention a finely-draped female figure (supposed a Flora, but without attributes) discovered on the spot where, on the 25th January last, was laid with solemnity the first stone for a Protestant Episcopalian church, designed by Mr. Street, for worshippers from the United States. Among busts of superior execution a head of Juno, a colossal portrait of Titus, and a fine colossal head of Bacchus stand out from the multitude. A seated female statue, headless and armless (probably a goddess—perhaps Cybele), is the most noticeable of recently found sculptures in the Palatine. The most precious art-works lately added to the Capitoline Museum are two small statues dug up within the great public cemetery at the extramural S. Lorenzo: a youthful Hercules, with laughing expression and a boyish delicacy of form very unlike the more familiar types of that god, who here holds three apples (from the Hesperides’ garden) in his hand; also a Cybele seated on a throne in a kind of sedecula, found entire, and with a curious dedication on the front-cornice:—“Terræ Matri S. A. Hortensius Cerdæ Conservatrici meæ. D. D.” In this museum is also placed the singular monument, with a statuette-relief, to the literary youth Quintus Sulpicius Maximus, who died at the age of eleven, having won a prize for Greek poetry in public competition,—the memorial of him, with his poem in Greek chiselled beneath his effigy, having been immured in one of the round towers of the Salarian Gate, destroyed (I am sorry to say) by the new authorities for the erecting of a new “Porta Vittorio Emannuele” on the same site.

Other projects, not all carried out, which promise well for art interests are the new museum on the Capitol, that already open for local antiquities at Ostia, some (private) on the grounds purchased for building near the beautiful domed edifice mis-called “Minerva Medica Temple.”

Two of the relief representations of the sacrifice of Mithras (the god piercing with his dagger the allegoric bull), several examples of which mystic subject are seen in Roman museums, have been lately brought to light, one from the pavement of an old house in Trastevere, the other from a cavern (no doubt destined for the worship of that Persian Sun-god) in the Capitoline Hill—this last, we may conclude, no other than the sculpture seen in a subterranean recess below that hill, and reported with wonder by Flaminio Vacca in the sixteenth century. Those Mithraic reliefs, highly interesting for symbolism, are of the rude and feeble execution which indicates a late period, the decline of art, and also the long, lingering life of that Oriental religion. Both are now placed in the Palazzo dei Conservatori on the Capitol. In a hall of the same palace has been formed a provisional museum, containing a great variety of objects, artistic and

for household or other uses, some beautiful, and all more or less curious; the majority found on the Esquiline Hill and in or near the Prætorian Camp, all the architectural fragments (among them some splendid specimens of variegated breccia, with agate embedded in the many-hued component masses) will be transferred to the collection in the Tabularium; the sculptures to the Capitoline Museum in the opposite building, or to some other yet unchosen locality. In the best among sculptures now on view, as they are provisionally placed, we observe the Romano-Greek characteristics, vigour, truthfulness, and a noble simplicity. Well are these qualities displayed in these life-size statues of athletes about to engage in contest, all nude and of finely developed muscular forms, powerful without any coarseness; the heads expressive, even beautiful. A statuette of Venus rising from the sea, or the bath, and wringing the water from her long hair is most graceful. A head of a youthful faun, crowned with pine cones, has visible traces of colour, vivid red, &c., and in its half-savage character a certain poetic wildness. An immense number of terracotta lamps and decorative details are mixed with iron and bronze objects: some chains and manacles, for refractory Prætorians perhaps, among those metallic specimens. The numismatist will be delighted by a numerous assortment of copper and silver medals; the student of historic monuments by a variety of epigraphs, some interesting in their titles and import—one with the indication of an officer, the “Præfectus Equitum,” known to have been maintained not longer than from the reign of Augustus to that of Claudius: “P. Numicius Picæ Cæsiano Præf. Equitum VI. vir Pro Pi. Provinciæ Asiæ Tri. Pi. Provincia Asia.”

In another sphere, private enterprise, I have to mention some sarcophagi with good reliefs, of the third century, as appears probable, found in a mausoleum, long unopened, on an estate near the Appian Gate. In the range of Christian archæology I am glad to report that the Chev. de Rossi and his assistants are not interfered with by the new authorities, those gentlemen continuing connected with the ecclesiastical and dependent on the Pope. The only considerable works in catacombs since the political change are those still progressing, though slowly and with but few hands, in the cemetery called after S. Calixtus, the burial-place of the popes during the second century; also in that (I prefer “cemetery” to the mediæval term “catacomb”) called after Prætextatus, the representative of a patrician family, and in which latter hypogæa are seen the tombs of martyrs who suffered in the second century. A most interesting and extensive range of the subterranean corridors and chapels belonging to the S. Agnes Cemetery has been opened, and is still being worked, by the monks of the monastery at the extramural church dedicated to that saint.

But more memorable than all the discoveries and art-objects I have alluded to are those secured through the labours, long carried out, at those pre-eminently classical and promising centres, the Forum and the Palatine Hill. C. I. HEMANS.

(To be continued.)

#### SOCIETY OF FRENCH ARTISTS.

THE sixth exhibition of the Society of French Artists, now open at 168, New Bond-street, is distinguished from former exhibitions by the great picture by Eugène Delacroix of the “Death of Sardanapalus” which occupies nearly the whole of one of the walls of the small gallery. The apparition of such a picture as this in a modern gallery where we are only accustomed to find faithful landscapes and sentimental domestic genre subjects is perfectly startling. It is like an opium dream in its evil beauty and splendid horror. Delacroix, we are told, considered this work “the greatest feather in his cap—the triumph of orientalism over the Spartan daubs of the David school.” His contemporaries, however, did not agree with him, and the “Death of Sardanapalus” excited much adverse criticism when it was first exhibited in the Salon of 1827. Only recently has a more favourable opinion prevailed. The estimation in which it is now held is sufficiently proved by its having fetched 96,000 frs. at the recent sale of the Wilson collection in Paris.

At first the confused detail of the terrible scene represented is bewildering, but the eye soon recognises the masterly drawing and still more masterly colouring that the painter has brought to his work. The composition of the picture, both as regards

the grouping of the struggling masses of men, women, and horses, and the disposal of the lights and shades, is almost worthy of Rubens. Few other masters could have commanded such subtly gradated and complex flesh tints, or have poured out such lavish magnificence of colour. But the faults of Rubens are in a still greater degree the faults of Delacroix. With every shade of colour we look in vain for any shade of emotion in this "Death of Sardanapalus." The dying monarch himself is insignificant, and the actors in the wild massacre going on around him are actuated by no passion save an uniform fury. Byron's terrible conception remains therefore unrealized, for the painter has not understood the "fiery workings" of the poet's heart, but has only represented the material image called up by his verse. Still, when criticism is exhausted this "deed" of Delacroix's will remain like that of Sardanapalus—

"A problem few dare imitate and none despise."

Turning from this picture to the peaceful landscapes that form the greater part of the remainder of the exhibition seems like coming out of a theatre into quiet country lanes; Jules Dupré leads us beside a still river, Marie Collart takes us into an autumn forest through which the light gleams from a threatening evening sky, G. Courbet places us with a man and a girl in a boat on a dark pond in Franche Comté, and Corot brings us to many pleasant places, all of which however, when looked at too near, seem undefined and enveloped in mist. This peculiarity disappears to a great extent when the picture is seen from a distance. The painter has evidently had regard to the position his pictures were likely to occupy on the walls of rooms, and has wished them to be seen to their best advantage without giving people the trouble of going up to examine them.

One really fine landscape appears among the many pleasant ones in this exhibition. "River Pastures," by Jules Dupré, No. 88, is lifted far above the commonplace by its skilful disposition of light and shade. The little pond in front, by which the barely sketched horses are standing, is made to reveal its secret in the strong light thrown on it by the strangely lurid sky. The whole scene, in fact, is rendered poetical in the same way as Rembrandt would have made it so, by a true artistic perception of the mysteries of light and shade. This picture hangs in the upper room of the exhibition, where also may be seen several of J. A. M. Whistler's daring experiments in colours. In the "Golden Screen—Harmony, in Purple and Gold," No. 109, he seems to have emulated the painting on the Japanese screen that the lady holds in her hand. M. M. HEATON.

### NOTES ON ART.

The private picture collections of France have never been described and criticised as our English collections have been by Mrs. Jameson in her excellent *Handbook to the Private Galleries of Art*, and by Dr. Waagen in his *Treasures of Art in Great Britain*, but the *Gazette des Beaux-Arts* is doing its best to remedy this omission in the articles descriptive of various important private galleries that have recently appeared in its pages. The collections of M. Thiers, M. le Comte Duchâtel, M. Maurice Cottier, M. le Comte Pourtales, M. de Morny, M. Delessert, M. J. Pereire, M. le Marquis de la Rocheb., M. Papin, and M. Laurent Richard, collections now for the most part dispersed by the auctioneer, have already been described, and in the present number we find an interesting account of the "Galerie de M. Gustave Rothan." The Rothan collection has only recently been formed. According to M. Paul Mantz, its critic, it has been formed with much judgment. It is rich in works of the Dutch school, especially in those of one of its earlier masters, the jovial veteran Frans Hals. The article is illustrated by an etching from a portrait by him called "La femme au gant" that is very like a Rembrandt; indeed Frans Hals, more perhaps than any other painter, may be considered the master of Rembrandt. Nicolas Maas, Rembrandt's greatest pupil, is also well represented, but the portrait assigned to Rembrandt himself is "fortement contesté," some critics believe it to be by Reynolds. Adrian Van Ostade, C. Netscher, Jan Steen, the dreary Palamedes, Van Goyen, Lingelbach, W. Van der Velde, Ruysdael, and Hondekoeter are other Dutch masters whose names we meet with in the Rothan collection. It is not stated whether this collection is doomed to follow those already mentioned to the Hôtel Drouot.

Among the many parts that M. Thiers has played in his time has been that of art critic. The *Gazette des Beaux-Arts* quotes a long passage from an article in *La Revue européenne* on *David et son École*, written by M. Thiers in 1824, in which he expresses his love of the ideal and the beautiful in art, *le vrai beau* and *le grand beau*.

On the 6th of April the anniversary of Raphael's birth and death was celebrated at Urbino. Mr. Morris Moore, in compliance with the desire of the president of the Raphael Academy, gave a lecture on Raphael and his works, and afterwards finding that 5,000 lire were still wanting to complete the sum necessary for the purchase of the house where Raphael was born, he kindly offered to contribute this amount. At the banquet that followed the Mayor conferred on Mr. Moore the rights of an honorary citizen of Urbino, and bestowed on him also the privilege of always having a room at his disposal in the Raphael-house.

The death is announced of Pierre-Antoine Labouchère, a French painter of some note. M. Labouchère was a pupil of Paul Delaroche, and is principally known by his subjects from Protestant history, especially by his numerous paintings representing episodes in the life of Luther.

The empty spaces in the Gallery of the Luxembourg caused by the number of paintings that have been sent to the Vienna Exhibition have been partially filled up by several works that have been laid aside for many years. Among these we find a *Temptation of Christ*, by Ary Scheffer, a man's portrait, by Gigoux, *le Bien et le Mal*, by Victor Orsel, and a *Relais de diligence en Normandie*, painted in 1831, by Charles de la Berge.

The great Laurent Richard collection—a collection "consecrated exclusively to the glorification of the modern French school"—was sold on the 7th inst. at the Hôtel Drouot. This sale has been the talk of the artistic world for some time past, and it was, as might be expected, very largely attended. "A tumultuous crowd," says a French paper, "followed the experts." We have in a previous number given some account of the principal pictures of this collection. It only remains to add the prices they realized—prices that go far to prove that their value was not over-estimated by connoisseurs. In almost all cases the painters were represented by some of their best works.

We have to regret the death of Mr. William Davis, the landscape painter. His pictures were for the most part small, and have scarcely ever been favourably seen at the exhibitions; but that called "Harrowing" was a noted and much admired example of his works at the International Exhibition in 1862.

The activity which is manifested at Berlin is also apparent at Vienna. If the plans of the Austrian Government are carried out we shall have a new museum to replace that of the Belvedere, in which there will be room not only for the grand collection at present crowded into a small and inconvenient space, but also for a host of canvasses and panels, many of which are now lying in magazines and even in lumber rooms of imperial country houses. The new collections will require new catalogues, and these it is the first aim of the director, Professor Engerth, to obtain. We may hope that the importance of giving to works of art their genuine names will be recognised. It is quite necessary that the new catalogues, both at Vienna and Berlin, should tell the public the truth.

### Theology.

The Scientific Bases of Belief. J. J. Murphy. Macmillan and Co. 1873.

THERE is a book by Harris, a meritorious though neglected thinker of the last century, by whom Boswell fructified much, entitled *Philosophical Arrangements*, the title of which indicates exactly the kind of speculative power which Mr. Murphy displays. He is hardly what is called "a suggestive thinker," that is to say, he does not deal in brilliant aphorisms which opponents can isolate and accept; he certainly is not a powerful reasoner, he is apt to think he can turn probabilities into certainties by a series of cross references; and, though this is a less defect, he trusts by preference to the cumulative force of many weak presumptions rather than to one solid chain of argument. Nor can it be said that he is a great master of exposition, and understands how to marshal a great body of facts impressively. And yet it must be admitted that he has thought out a clear, coherent system which answers most of the questions which we have been in the habit of asking; that the answers are never in flagrant contradiction with knowledge, and are even

sufficiently supported by a few important facts and a great many plausible analogies to produce a strong impression on an ingenuous and attentive reader that there must be something in it all.

Readers whose habits of thought are too fixed to yield to anything short of scientific demonstration will be inclined to maintain that a method which combines the physics of *Habit and Intelligence*, a work which has many curious points of contact with Hartmann and Schopenhauer, and the transcendental Christianity of Erskine of Linlathen, proves nothing because it is capable of proving anything. But after all this is only a presumption, and those who can resist it will find the book sufficiently ingenious to repay them.

The writer's object is to show that spiritual truth may be made to rest upon scientific truth in the same way that the higher sciences rest upon the lower without being developed out of them; e.g., biology presupposes chemistry, but it is impossible to construct biology from the data of chemistry or even to explain all biological laws as cases of chemical laws. His main positions are as follows: Knowledge is valuable both as a guide in action and still more as an aid to the formation of character. Knowledge of the former kind can only be obtained by inductive science starting from data of observation (and as for this purpose all other methods are sterile Comte was so far right in his condemnation of metaphysics); but when we have attained all that is possible in this direction we need to interpret and realize our knowledge (Mr. Murphy does not recall the significant fact that Comte's last work was a subjective synthesis), and this is done by metaphysical science starting from data of consciousness.

He has an unusually firm grasp of the position that "there is no ground for believing matter and mind or spirit to differ in their essence: and that while inductive science reveals a world of matter whereof mind is one of the functions, metaphysics reveals a world of spirit whereof matter is one of the functions, so that we recognize the deepest realities of the universe as not material, but spiritual." At first sight this position scarcely seems to go beyond what Professor Huxley for instance would accept, though perhaps he might think the truth of the last line insufficiently established by deductions from the different aspects of the fact that our only intuition of force is furnished by our own volitions. But there is a more important difference: so far as Professor Huxley would admit the generalization it stands for him at the end of science; for Mr. Murphy it is always in the foreground as the starting-point of philosophy, lighting up such conceptions as the laws of thought, the ground of the moral sense in uncreated law, our faith in the uniformity of nature, and the intelligence shown in the adaptation of organic nature to inorganic. This intelligence Mr. Murphy does not believe to be supreme, but since it began to exist in time it must derive from an Intelligence which is eternal. Here we come to one of the most disputable points of the system. The author is very much impressed by the facts which prove that the solar system cannot always have existed under its present conditions and tell in favour of the nebular hypothesis; of course these facts are also a presumption in favour of the hypothesis of creation, but they are only a presumption. If it were proved that all the bodies which fill known or conjectured space had once been evolved from a nebula it would still be quite possible that that nebula represented the fatal dissolution of a pre-existing cosmos and so *ad infinitum*, though in the present state of knowledge such a conjecture would be purely arbitrary.

Another point on which the author really founds as largely as upon the resolution of matter into force and force into

will is the fact that consciousness is only the last stage of intelligence, and that conscious thought is determined by data which if normal are objectively valid though lying out of consciousness. This view perhaps is hardly so fully developed as its importance in the writer's system deserves; but it underlies not only the doctrine of faith as unverified certitude, but all the ingenious and perplexed discussion which is meant to establish that an unlimited field for transcendental inference is opened when we once have argued from intercourse with others to personalities which resemble our own.

With such premises and such methods the writer is in a tolerably hopeful condition for attempting a scientific reconstruction of theism, and has risen above the inducements to treat the habitual experience and the familiar ways of thinking of the present generation as decisive presumptions against Christianity.

The most interesting of his special views are on the purpose of creation, where the limits of optimism are stated with great refinement and decorum; on ecclesiastical authority, which is valuable as eliminating individual crotchets; on the psychological interpretation of original sin as the inherited perversion of our faculties caused by the distorting influence of a premature self-consciousness: the contrast between Christian and Stoical morality and the vindication of the doctrine of eternal life from the superficial imputation of selfishness are also meritorious, though it may be less original. The writer's weakness as a theologian is his ignorance of the history of doctrine, which is really a far surer guide to the inner harmonies of truth than the principle of contradiction which he is much too ready to apply upon subjects where the highest ideas must be inadequate. Another consequence of this unhistorical spirit is a disposition to treat the Old Testament more cavalierly than critically, partly because the writer assigns an absolute validity to our present moral ideals, and makes the character which it is our duty to cultivate under our existing relations binding not only upon distant ages, but upon intelligences of an order incommensurable with ours.

But with all these drawbacks the book is not without a substantial value: the writer continues the work of the best apologists of the last century, it may be with less force and clearness, but still with commendable persuasiveness and tact, and with an intelligent feeling for the changed conditions of the problem.

G. A. SIMCOX.

**Sacraments and Sacramentals.** (*Sakramente und Sakramentalien in den drei ersten christlichen Jahrhunderten.*) Von Dr. Ferdinand Probst. Tübingen. 1872.

DR. PROBST has here undertaken to trace out from such indirect notices as are available—for there are of course no liturgies or rituals of that date extant—the ceremonies and manner of administering the seven sacraments and those lesser rites called sacramentals, such as exorcisms and benedictions, during the first three centuries. And inasmuch as dogma and ritual are from the nature of the case closely connected, this has also involved an inquiry into the sacramental doctrine of the period; only in treating of the Eucharist, where anything like an adequate discussion of doctrine would have been impossible within the limits of the volume, he has confined himself chiefly to the externals of the sacrament. The book is accurate and painstaking, and will be found very serviceable to theological students, though we are not sure that the author has always satisfactorily established his conclusions. Of the general correctness of his estimate of the teaching and practice of the early Church there can be no reasonable doubt. And he is quite right in pointing out that precise statements as to the number and nature

of the sacraments are not to be looked for in the patristic age, to which it must be added that the *disciplina arcani* often increases the difficulty of ascertaining what really was definitely taught. Before the time of St. Thomas the common term *sacramentum* was applied indifferently to sacraments and sacramentals, and Peter Lombard in the previous century was the first to specify the number of seven. But it is not difficult to gather from the Fathers and the Apostolic Constitutions the substance of what was believed and the main outlines of the ritual, and it is abundantly clear that the whole system was in its essential conception the Catholic and not the Protestant one. All the seven sacraments are mentioned—and sometimes by Tertullian, as nearly all of them together—by early writers. Dr. Probst expresses the central idea of the system when he says that Christianity ultimately rests on the Person of our Lord, and that the sacraments, and especially the Eucharist, in which they culminate, are the extension and continual application of His Incarnation and Sacrifice. "The Eucharist, as transubstantiated, takes the place of the Incarnation, and as a sacrifice, of the death of Christ, and conveys to us not merely grace and truth, but Himself." The whole passage may recall to many readers a striking passage of Goethe, setting forth with that imaginative power by which genius can realize intellectually what it never experienced, how in the Catholic idea the sacraments interpenetrate and transfigure as with the radiance of a perpetual benediction all the incidents of human life from the cradle to the grave.

The first part of the volume, which is occupied with sacramentals, examines the ancient theories of demoniacal influence and possession and the various methods of exorcism, and then goes on to describe the different kinds of priestly benediction, as of water, oil, and the like, showing in many cases the close resemblance of the ancient forms to those still in use in the Latin ritual and pontifical. The second part carries us in successive chapters through the seven sacraments, discussing in minute detail the nature, minister, recipient, and time and manner of administering each of them. Considerably the longest chapter, extending over more than a fourth of the entire volume, is devoted to the sacrament of penance, where the whole disciplinary system of the early Church necessarily comes under review. The author has done his work carefully and conscientiously, but he does not appear to us to have thrown much new light on points fairly open to controversy. Thus e.g. his argument for unction having always formed an integral part of the ritual of confirmation is by no means conclusive as regards the Western Church at least, and the fact of the imposition of hands being alone specified as the means of imparting the Holy Ghost in St. Cyprian and some other early authorities looks the other way; nor is it at all clearly proved that where the sacrament was administered immediately after baptism it had always included a distinct anointing from that which formed part of the baptismal rite. We are rather surprised to find no reference in the chapter on Eucharistic liturgies to the distinction of Eastern and Western usage as to the invocation of the Holy Ghost. The epitaph written by Pope Damasus (366-384) on the acolyte boy Tarcisus, who was beaten and trampled to death while carrying the viaticum to a confessor in prison, affords strikingly explicit—and the more so because purely incidental—evidence to the contemporary belief in transubstantiation.

"Ipse animam potius voluit dimittere cæsus,  
Prodere quam canibus rabidis cœlestia membra."

We cannot follow Dr. Probst through his elaborate and valuable chapter on the sacrament of penance. But here again, in discussing such vexed questions as the relation of the *exomologesis* to sacramental confession, and the contemporary

evidences of a recognized obligation to confess sins of thought only, he seems to us, after all, to leave the matter very much where he found it. The slender and indistinct notices of the sacrament of unction in early writers are sufficiently explained, as the author justly points out, by the absence of any controversy on the subject, and the close connection of the ordinance with the miraculous *charisma* of healing, as well as by the *disciplina arcana*; and the very direct testimony of Scripture for this sacrament—far more direct *e.g.* than for Confirmation—goes far to supersede the importance of later authorities. Still we were disappointed not to find somewhat fuller information on the subject; here again the distinctions of Eastern and Western usage are not once touched upon. The rite of ordination is shown to have consisted exclusively at this period in prayer and imposition of hands by the bishop; other ceremonies, such as unction and investing with the chasuble, having been introduced later; nor were the minor orders conferred, with the exception of *lector*, before the time of Pope Fabian (238). The concluding chapter on the sacrament of matrimony contains much interesting matter. The absolute indissolubility of Christian marriage is shown to have been strictly maintained, but in the case of adultery a separation was enjoined until the guilty party was brought to repentance; no second marriage, however, being in any case permitted. Indeed second marriage after the death of the first partner, which is often termed “bigamy,” was discouraged, though not forbidden, as well on grounds of chastity as out of regard for the memory of the former union and the anticipation of a renewed spiritual intercourse hereafter. Third marriages are stigmatized in the *Apostolic Constitutions* as a proof of incontinence, and any subsequent marriage as “open fornication.” Indeed canonical penances were imposed on bigamists and trigamists in the fourth century, of one year for the former and from two to five for the latter: whether the duration was the same or longer in the previous centuries is not now known. Origen, while allowing second marriage for the hardness of men’s hearts, says that it does not correspond to the true idea of Christian marriage, and that “bigamists will be saved, but not crowned.” To the clergy second marriage was (in accordance with Tit. i. 6, and I. Tim. iii. 2) strictly forbidden from the first throughout the universal Church.

### Intelligence.

Dr. Keim, whose work entitled *The History of Jesus of Nazara* is attracting so much attention in theological circles, will shortly exchange his professorship at Zurich for one at the small German university of Giessen. The *Protestantische Kirchenzeitung* for March 29 and April 5, contains a paper from his pen on the epistle of Diognetus, in opposition to the view of Dr. Overbeck, noticed in a recent number of the *Academy*.

Dr. Hilgenfeld, of Jena, has announced a course of lectures on “Introduction to the New Testament,” with a view, we believe, to their ultimate expansion into a volume.

The second volume of the *Protestanten-Bibel* has appeared. The notes are less meagre than in the first volume. We may call attention especially to the commentary on Romans by Professor Lipsius.

The new *Bible Educator*, edited by Professor Plumptre, is rather disappointing. It contains some useful matter, and may penetrate into quarters where the name of Cassell is better known than that of Murray. But we are not sure that we understand the object of the publisher and editor. Some of the papers seem too dry and technical for popular readers, others too meagre and unscientific for scholars. The chief contributors are Dr. Payne Smith, Dr. Ginsburg, Messrs. Rawlinson, Stainer, Carruthers, Houghton.

The *Bible for Young People* is a translation of a popular Dutch work by Dr. Oort, assisted by Drs. Hooyas and Kuenen. It aims at reproducing so much of the results of modern criticism as can be adapted for the purposes of moral and religious education, but may also be recommended to general readers.

The French translation of Nöldeke’s *Old Testament Literature*, announced in our last number but one, has just appeared.

### Contents of the Journals.

*Centralblatt.* March 15.—Otto’s edition of the *Apologists*, vol. ix., rev. by F. O. [Supplies a carefully revised text, but fails conspicuously in the “higher criticism.”]—April 12.—Lüdemann’s *The Anthropology of the Apostle Paul*, rev. by ψ. [A work of great promise from an advanced critical point of view. But the author credits St. Paul with a logical consistency and a definiteness of intention which can hardly be admitted.]—April 19.—Weiffenbach’s *The thought of Jesus of the second coming*, rev. by ψ. [Maintains with remarkable ability that the second coming or personal return of Jesus was not originally announced by Him in connection with the destruction of Jerusalem and the appearance in the clouds, &c., and that it formed the kernel of the promise of the resurrection. The separation of the second coming and the resurrection, and the sensuous description of the former, are shown to be due to the disciples.]

*Monatsschrift für Gesch. u. Wiss. des Judenthums.* (Biblical articles.) March.—The “Mons Offensionis” on the Mount of Olives, by Dr. Grätz. [The spot where Solomon erected the high places is shown to have been the most northerly of the three summits of the mountain. But the phrase *har hammashkith*, rendered “Mons Offensionis,” is simply an ironical monotheistic alteration of *har hammishkiah*, “mons unctionis,” the name by which the Mount of Olives is known in the Talmud.]—April.—Septuagint translation of *Ecclesiastes*, by M. Salzberger.—[Shows that this version abounds in peculiarities of Aquila, to whom it is therefore probably due.]

### Philosophy and Physical Science.

On the Psychological Origin of the Idea of Space. [Ueber den Psychologischen Ursprung der Raumvorstellung. Von Dr. Carl Stumpf, Privat-Docent der Philosophie an der Universität zu Göttingen.] Leipzig: S. Hirzel. 1873.

THIS very interesting investigation into the psychological origin of the conception of space is an attempt to do for the psychological what Helmholtz has done for the physiological side of the problem. The question discussed has special claims upon English students, because so much attention has been bestowed upon it in this country. Unfortunately English writers upon this subject have not sufficiently distinguished from each other the separate interests of physiology and psychology, and our physiologists have been too much inclined to believe that their investigations have exhausted the whole of the subject and not one side of it merely; while, if we except Mr. Herbert Spencer, our psychologists are so completely carried away with the idea of the omnipotence of “Association” to explain all things and everything, that their theories are never able to satisfy the requirements of the phenomena.

Dr. Stumpf begins with an historical review of what has been already done to settle the problem, and classifies all previous theories under the four following heads. The conception of space is either that of a special combination of momentary sense-qualities, *e.g.* of colours, the one with the other; or a combination of those with the qualities of another sense, *e.g.* with the sensations belonging to muscular feeling; or it does not arise from the senses at all, but is the effect of a special productive activity of the soul (*Seele*), which acts independently of and in addition to sensation; or, lastly, it is perceived in and along with the other qualities given in sensation, and comes into being whenever those are perceived by the corresponding sense. The first is the theory of Herbart, the second that of Bain, the third that of Kant, and the fourth is called by Helmholtz *Nativism*. Of these four theories Dr. Stumpf holds, that the last is the only tenable one, and he believes that the true mode of investiga-

tion is to begin with the results of this last theory, and more strictly determine the precise relation which subsists between the quality perceived and the extension or space in which it is conceived. Colours, for example, he holds, are as necessarily from the outset perceived in a certain extension in space or in a given place as they are conceived to have a certain intensity or strength.

We can only notice the more important results at which Dr. Stumpf has arrived in the course of his investigations:—

(1.) There is a space which belongs to sight, *i.e.* there is something in the sensation which is as directly perceived in consequence of the optic nerve-process as the quality of colour is, and which has all the attributes that we ascribe to space; and this is neither a simple combination of sensations of colours, nor a combination of these sensations with the qualities of another sense, nor something spontaneously produced by the mind over and above sensation. (2.) Space and colour are parts of the same content of sense, *i.e.* they are necessarily comprehended in and with each other. Space cannot be conceived apart from colour, nor colour from space. The contents of the sense of sight include both space and colour. (3.) Space is not originally arrangement in space, still less succession. These are relations founded on space, later discriminations, and not the original conception. (4.) Space, as originally perceived, consists not of two but of three dimensions; but only a minimum and not all of the relations of depth are immediately perceived. The *minimum visibile* is a spot situated at a definite distance, either changing or always the same, and this spot as originally seen is *spheroidal*. (5.) The principle of association educates this original conception of space up into the very complex series of relations which belong to the more developed idea; but association cannot account for the original *minimum visibile*.

These are the more important statements made by Dr. Stumpf regarding space in its relation to the sense of sight. The same principles run through his discussion of the relations of space to the contents of the other senses, and we need not refer to the special applications to the senses of hearing, taste, &c.

To the book is appended a short and very suggestive statement by Prof. Lotze of the points of agreement and difference between his own theory and that now submitted to the philosophical public by his young disciple. Upon the whole we are inclined to believe that Dr. Stumpf's theory is a decided advance on Prof. Lotze's, and that this advance is due to his assimilation of the results of such a scientific physiologist as Helmholtz.

Dr. Stumpf has communicated a *résumé* of his investigations and results to the *Göttingische gelehrte Anzeigen*, Stück 10. März, 1873.

THOMAS M. LINDSAY.

## Notes on Scientific Work.

### Physiology.

**Microscopic Researches on Muscle.**—Dr. T. W. Engelmann, of Utrecht, contributes a long article on this subject to *Pflüger's Archiv*, Band vii., Heft i. He laments the difficulty of obtaining the crystalline arthropods of the sea, and observes that the tolerably transparent Cyclops, Gammarus, Asellus, Hydrachinda, and Insect larva as *Corathra plumicornis* of fresh water are only to be obtained in small and insufficient numbers. For the examination of muscular fibres no reagents or saline solutions should be used; they should simply be placed in a moist chamber, and be examined as rapidly as possible after removal from the living body. Insect muscles can undergo great changes in structure before they lose their excitability. He has used a magnifying power of from 200 to 500 diameters, or that obtained by a Hartnack's objective 8 and eyepiece E or F. The structure of normal uncontracted transversely striated muscular fibre is: (1) A light very slightly refracting band divided into two halves by (2) a dark highly

refractile stria; (3) a moderately dark, tolerably strongly refracting band, in the middle of which is (4) a brighter, less refracting stria. In every fibre with very broad transverse striae the simple dark band can be resolved with high powers into three: a middle darker one, and two lateral clearer or brighter ones. Hence we must admit that such division still exists even where our present means of research do not permit it to be seen. Throughout his paper Engelmann makes use of the following terms: the stria Z in the middle of the isotropical substance he calls the intermediate disk (*zwischen-scheibe*) and the adjoining striae (i) secondary or accessory disks (*nebenschreiben*). Both of these together, when they cannot be distinguished as separate, constitute the fundamental membrane (*Grundmembran* of Krause); the middle layer (m) of the doubly refracting substances forms the median disk of Hensen, and the two

intermediate disk ( <i>zwischen-scheibe</i> )	{ isotropical band (half) ( <i>zwischen-</i> <i>substanz</i> of Rollett).

intermediate disk ( <i>zwischen-scheibe</i> )	

lateral (g) he terms transverse disks. The figure renders Engelmann's views clear. In the closely striated muscles of vertebrata s and m appear united together to form a single and simple foundation membrane in which no subdivision can be seen. The distinctly striated fibres of insects, on the other hand, show the division well, and the whole series of disks in one compartment are here sometimes as much as four times thicker than in vertebrata. The height of each set varies even in different muscles of the same animal. The greatest height or length of one compartment Engelmann found to occur in the abdominal muscles of insects where it amounted to 0.011 mm. The isotropical and anisotropical substances are about equal in height, the proportion of the former to the latter being as 6:7. The degree of transparency of the several parts varies considerably, so that now one, now another may be the darker. Where both are of equal transparency the existence of transverse striae may at first sight be almost overlooked. The distinction is always well brought out by the polariscope. The remainder of the paper is occupied with a special description of each disk in succession.

From his examinations of muscle under polarised light and by other means he has arrived at the conclusion that muscular tissue is composed of an infinite number of rods arranged parallel to the longitudinal axis of the fibres which are naturally in immediate contact with each other, but which after death or after treatment with reagents shrink and exude or excrete the isotropical substance. The size and form of the rods he supposes to differ in each of the disks that make their appearance in the above scheme.

**The influence of various substances on the reflex activity of the Spinal Cord.**—Dr. S. Meihuizen after remarking (*Pflüger's Archiv*, March, 1873) that many pathological conditions are produced by, or at least are associated with, abnormal modifications of the reflex activity of the nervous system observes that this activity or excitability may be acted on by several therapeutic agents, the number of which has been greatly increased during the last few years. In the present communication he limits his remarks to the action of certain substances on the reflex activity of the spinal cord. Frogs are the animals best adapted for such experiments, because, in the first place, their spinal cord after section retains its activity for several days unaltered, and, secondly, the degree of excitability can be very accurately tested by Türk's method of irritating the skin with dilute acid and determining the contraction induced in the muscles. In other animals this method of excitation proved unsatisfactory, and after trying electrical and thermic means of stimulation, he at length constructed a little apparatus by which mechanical irritation in the form of a slight blow could be given; this he occasionally used, but he seems to have returned to the acid stimulus as the best. The first substance he experimented with was bromide of potassium. The action of this salt is not dependent on the bromine, since chloride of potassium acts if anything rather more strongly, whilst bromide of sodium is ineffective. Bromide of potassium rapidly lowers the reflex activity of the spinal cord, the subcutaneous injection of 0.015 gramme completely abolishing it in one hour and 0.020 gramme destroying it in a quarter of an hour. The question arises, How is this loss of excitability occasioned? There are five possible explanations. It may destroy the sensibility of the periphery of the nervous system, the centripetal or centrifugal conducting nerve tubules, the motor terminal nerve plates, or the muscles. By familiar methods of proof he demon-

strates clearly enough that the salt acts directly on the nerve centres. A similar series of experiments showed that acetate of zinc, hydrate of chloral, quinine, alcohol, caffeine, morphine, and digitaline all rapidly induce great depression of the excitability of the spinal cord, the last however through its action on the heart. On the other hand, atropine, cyanide of potassium, codeine, thebaine, papaverine, narceine, narcotine, nicotine, carbolic acid, theobromine, and ergotine exert little and then only inconstant action on the excitability of the cord.

**Researches on the Physiology of the Brain.**—In a recent number of the *Berlin. Klin. Wochenschrift*, 1872, No. 42, Hitzig shows that the transmission of a constant current through the occipital region of man causes involuntary movements; when the current is closed, the subject falling towards the anode, and the eyes with more or less nystagmus turn towards the cathode; the opposite movements occur on breaking the current. The same phenomena may be witnessed in rabbits. Similar movements are observed in rabbits, if the small lateral lobe of the cerebellum be removed, and in the hollow at the bottom of which the flocculus lies a piece of ice be placed. In man the involuntary movements of the eye induced by the current give the subject the impression that external objects are in movement, and the movement of the whole body must be regarded as an endeavour to maintain the equipoise. Severe injuries of the cerebellum thus act like the anode; they cause involuntary movements towards the side operated on, so that a rabbit in which the left lobe of the cerebellum has been injured or removed has the impression of lying on its right side. But if in its endeavours to recover its supposed loss of equipoise it turns over too vigorously towards the left it rolls over upon its back and the movements begin anew.

**Reflex movements of the Uterus.**—W. Schlesinger (*Jahrb. Wien. Med.* 1873) has made some further observations on the reflex movements of the uterus, and shows that electrical excitation of the centric extremity of a spinal nerve induces violent movements of the uterus in from five to fifteen seconds. If in a curarized rabbit on which tracheotomy has been performed the artificial respiration necessary for maintaining life be intermitted the organ at once passes into a state of violent contraction, and the same thing happens if the central end of the median, crural, or other nerve be electrically excited. The conduction of this reflex action, to which also the contraction of the uterus by irritation of the nipples is allied, does not take place through the spinal cord, for if the cord be divided in a rabbit, prepared as above described, irritation of a nerve trunk for forty seconds produces no effect. Further experiments showed that the nervous plexus on the aorta was one, but not the only course by which the reflex influence was conveyed.

**Structure of the Pancreas.**—According to V. v. Ebner, whose paper appears in *Max Schultze's Archiv für Mikr Anatomie* (Band viii. p. 481), the alveoli of the pancreas form branched tubes, provided with lateral pouches, but without a distinct lumen, which are bounded by a membrane that is everywhere closed (*Membrana propria*). The excretory ducts proceed from fusiform and stellate cells in the interior of the alveoli, forming the so-called centro-acinar cells. Fibrous or membranous processes are given off from the *membrana propria*, and penetrate into the interior of the alveoli, and by their anastomoses form a reticulum that is continuous with the processes of the centro-acinar cells. The gland-cells lie in the meshes of this reticulum, one cell, as a rule, occupying each mesh. The gland-cells have no processes.

**The Air in Public Schools.**—In an American journal entitled *The Sanitarian*, the first number of which has just appeared, Dr. Janes, city sanitary inspector, states that from the public schools of America Dr. Endemann obtained seventeen samples of air the examination of which determined the presence of carbonic acid varying in amount from 9.7 to 35.7 parts in 10,000, or in other words from more than twice to nearly nine times the normal quantity. The ventilation in the buildings is faulty, and can only be effected by opening the windows—a practice detrimental to the health of the children sitting near or directly under them. The following experiment, made in the Roosevelt-street School, New York, shows the inefficiency of ordinary ventilating flues in the wall when unprovided with means for creating an upward current. An examination of the air in one of the class-rooms furnished with a ventilating flue was made while one of the windows was open, and yielded 17.2 parts of carbonic acid in 10,000. The window was then closed, and after the lapse of ten minutes another examination gave 32.2 parts of carbonic acid, or an increase of fifteen parts. The air then became so oppressive to the teacher and children that the experiment was not continued.

**The Liver Ferment.**—Von Wittich contributes a short paper on this subject to *Pflüger's Archiv* (Band vii., Heft 1, 28) in which he states that two years ago he showed the blood to contain a ferment, and that this could be obtained not only from serum containing blood corpuscles, but from serum perfectly free from them. Owing to some difficulties raised by Tiegel he has been induced to repeat his experiments, and has satisfied himself of their correctness. He also shows that a liver from which the blood has been completely washed out contains a certain demonstrable proportion of ferment. He concludes, therefore, that the liver ferment is formed in the cells of the organ itself.

## Geography.

**Russian Exploration.**—Russian exploration is advancing throughout the length and breadth of Asia. Recently we noticed the combined trading and surveying expedition which had been pushed into Mongolia, and now we have intelligence of a journey much farther south. At the *séance* of the Imperial Russian Geographical Society held on the 7th of February it was announced that the expedition under M. N. Prjévalsky to the lake Koko Nor, westward of the province of Shen-si in China proper, and Tibet, was being continued with success in spite of the greatest difficulties. M. Prjévalsky passed the autumn near Sinina on the north of the Koko Nor, and purposed to remain for the winter in the vicinity of that lake. The Russian detachment settled at Krasnovodsk on the eastern shores of the Caspian have greatly extended their surveys towards Khiva during the autumn of the past year. The old bed of the Amu Daria has been examined for more than two-thirds of the distance between the Caspian and the Khivan Delta. Southward the range of the Kuren Dag and the course of the Attreck from its tributary the Sumbara to its mouth have been thoroughly explored, and in the course of these surveys no fewer than eighty-six positions have been astronomically determined.

**The Upper Nile.**—In the forthcoming number of the *Mittheilungen* Dr. Petermann has published a number of letters received from the traveller Ernest Marno written from various points on the Upper Nile during last year. The letters are illustrated by an original map of the Bahr Seraf (Giraffe) drawn from Marno's observations. This river is a main branch thrown off from the Nile in the region which lies between the latitudes of 7° and 10° N., and which from its wilderness of swamps and rank grass forests, and its deadly climate, has become an almost impassable barrier to travellers seeking the higher regions of the Nile basin from the Egyptian side. It may be remembered that Sir Samuel Baker's expedition on arriving in 1870 near the point at which the Bahr Seraf rejoins the main Nile found that the chief arm of the river had become perfectly closed to navigation, the vast masses of floating vegetation continually brought down by the stream having collected so as to form a new district of many miles in extent, beneath which the river passes by a subterranean channel; and that after an attempt to cut a way through this barrier the expedition tried the channels of the Bahr Seraf, through which it forced a passage, but only with enormous labour and disastrous loss of life.

Marno's letters enable us to understand the difficulties which beset the Egyptian expedition and the horrors to which it must have been subjected. From February to June of 1872 Marno suffered from no less than forty attacks of fevers, and these with dysentery and bronchial diseases, caused it is supposed by the impurity of the river water, prostrated every man of his company. The country is a network of water channels, which in the rainy season become one vast mosquito swamp. In the dry season the swamp water becomes unfit for drinking, and ants appear in myriads. "It appears that the Seraf" (now the only passable channel of the Nile in this region) "is becoming more difficult of navigation from year to year. This is caused by the grass, the so-called Om Sufa, gaining ground year by year; the few high parts of the river-banks are annually undermined by the river and fall in, filling up the bed with sand and mud, and so it may happen that in a few years the passage by this branch also may become impossible."

## Geology.

**The Geology of the Eastern Portion of Turkey in Europe.**—In 1869 Professor von Hochstetter undertook the exploration of the eastern and central divisions of Turkey in Europe for the Ottoman Government, and published in the *Jahrbuch der geologischen Reichsanstalt* for 1870 the first part of his report on the geology of the country surveyed, comprising Eastern Thrace, the Balkan Mountains, the Roumelian Mountains, and the Despoti Dag and Rhodope Mountains. This important paper is concluded in the *Jahrbuch* for 1872, part 4, 331. In the introduction von Hochstetter gives a detailed description of the physical geography of the remaining region: Central Turkey, or the Vitos territory, and the Upper Morava territory. The Vitos Mountains are chiefly composed of syenite, containing reddish orthoclase, white trichlin feldspar, and black and sometimes greenish hornblende, as well as quartz, magnetite, and, not unfrequently, black mica; titanite is also met with in considerable quantities, apatite but rarely. The magnetite of Samakov is worked by washing the decomposed masses of syenite. At places the syenite is penetrated by dykes of melaphyre belonging to the younger eruptive rocks; these appear more especially on the northern slopes of the Brdo Mountains. The elevated plateau of Samakov is separated from the low valley of Dubnica and Radomir by ranges chiefly composed of old crystalline rocks, which connect the Rilo-Dagh with the Vitos. West and south-west of the Vitos we find a system of sedimentary rocks, which in Central Turkey always comprise three different and easily distinguishable series of beds. Everywhere overlying the crystalline rocks is found a system of red or white quartz-sandstone with coloured marls, chiefly red but sometimes grey and green, as well as limestone and dolomite beds. Resting on this base are grey

and white dense limestones and layers of dolomite of extraordinary thickness, which together build up the Golo Brdo Mountains and the Konjavo and Vrbina Planina. It has been assumed that these two series represent, as in the Alps, the Lower Permian (the Rothliegende) and the Lower Trias (the Werfen beds), while the second system of limestones and dolomites belong to the Middle and Upper Trias. It is more probable, however, that they are analogues of similar structures in the northern Carpathians, in which case the lower system would be Keuper, and the limestones with dolomite would represent liassic deposits. The third system is composed of greyish brown shaly sandstones with argillaceous marls, which lie unconformably on the beds of the former systems, and are evidently of cretaceous age. They yield several fossils, amongst them *Ammonites mamillatus* Schloth. of the gault. In this respect also this system corresponds precisely with the Alpine Gosau formation. The igneous rocks of the Lülün and the Vitos Mountains are throughout basic, having the characters of melaphyre, augitic porphyries and oligoclase or labrador porphyries, and are accompanied by sedimentary tuffs, conglomerates, and amygdaloids. The Upper Morava territory, between Vranja and Lescovatz, is chiefly composed of ranges of crystalline rocks which are connected to the south-east with the Rhodope, and to the south with the crystalline chain of the Skardus (Schar-Dagh) and the Pindus; they consist of gneiss, mica-schists, and old clay slate. Numerous rhyolite and trachyte dykes, with abundance of tufa, form another characteristic of this range. Von Hochstetter gives a detailed description of his sections of these divisions of the country, and concludes his memoir with a valuable table of heights, computed for the most part from observations made by the engineers of the Ottoman Empire. Two geological maps of the eastern and central portions of Turkey in Europe accompany the paper.

**Traces in Alsace of the Existence of Man during the Glacial Epoch.**—At Lahr, Baden, in 1823, and again at Eguishelm, Alsace, in 1866, human remains were found associated with those of extinct mammals, the mammoth, bison, stag, horse, &c., in the loam of the Rhine valley. Those at Lahr consisted of the half of a skeleton minus the head, those at Eguishelm were a parietal and frontal bone; in both localities the characteristic fossil shells of the loam, *Helix hispida*, *Pupa muscarum*, *Succinea oblonga*, &c., were likewise met with. M. C. Grad points out (*Comptes Rendus*, vol. 76, 1873, p. 659) that the loam extends along the whole of the Rhine valley from Basle to Mayence, and is essentially a consolidated glacial mud deposit, consisting of an intimate mixture of fine sand, clay, and carbonate of lime, in some places accompanied with minute scales of mica; the whole being perfectly homogeneous, and without a trace of stratification. In some parts it attains a thickness of more than 60 metres, and in others is entirely wanting, leaving exposed the bed of gravel and sand upon which it is observed invariably to rest, both in the valley of the Vosges and the Black Forest. That this lower and older gravel deposit is of fluvial origin is indicated by the entire absence of erratic boulders and glacial striae, and by the formation of imbricated banks, which M. Daubree has shown to be characteristic of the gravels now being deposited by rivers. The old terminal moraines of the Vosges, like the loam of the plains, always rests upon this gravel. M. Grad believes them in fact to be synchronous formations, and is of opinion that man lived in Alsace during the glacial period.

**Silicified Plants of the Upper Coal Measures near Autun.**—Among the silicified vegetable remains from the Coal Measures found in the soil near Autun, occur amorphous siliceous masses which enclose small fragments of the stems, roots, and other parts of plants, mostly Cryptogams. M. B. Renault, continuing his researches upon these interesting remains, refers (*Comptes rendus*, 1873, part 13, 811) some of the small detached stalks to the imprints known as *Sphenophyllum*. They are from three to fifteen mm. in diameter, and present on the exterior nodes which correspond to leaf-whorls as in *Sphenophyllum*. In the centre is a vascular axis of a triangular form consisting entirely of tubes diverging from the centre, scalariform or spiral at the angles, where they surround a cylindrical lacuna. This axis is enclosed by a tissue resembling that surrounding the vascular bundles in ferns and some Lycopods. Outside of this, the ligneous axis of M. Renault, are layers of cellular tissue belonging to the bark, which are traversed by eighteen vascular bundles proceeding towards the leaves. The nodosity of the stems and the verticillate disposition of the appendicular organs, as well as the probable number of these parts, are points of resemblance with *Sphenophyllum*, while their internal structure indicates the relations of these plants to the *Lycopodiaceae* and *Marsileaceae*.—M. Renault also describes the structure of a fragment of a silicified fructification spike, referred to *Annularia longifolia* and found in the same place. The stem is thick and slightly striated, bearing whorls of bracts, very different from the leaves of the sterile branches. Alternating with these are whorls of pedicels, to which are attached two sporangia, above and below; these occupy the whole space between the pedicel and the bract, and contain a large number of minute spherical spores. The axis of the fruit spike shows a broad central lacuna surrounded by a lengthened cellular tissue, containing from sixteen to twenty cylindrical lacunae placed at regular distances apart. These are accompanied by fibro-vascular bundles

enclosing striped ducts which appear to determine the grooving of the surface.

**The Dacites of Hungary and Transylvania.**—Dr. C. Doelter points out in a preliminary note (*Verhandl. der geol. Reichsanstalt*, 1873, No. 6, 107) that the dacites of Hungary and Transylvania are mostly hornblende and augite andesites, the former always having quartz as an essential constituent, the latter appearing to be mostly free from this mineral. The essential constituents of the dacites are a plagioclase feldspar, quartz, sanidine, hornblende, biotite, augite, magnetite, and apatite, the accessory minerals being chlorite and epidote. The quartz occurs as crystals in dihexagonal pyramids, and in grains for the most part porphyritically distributed. Sanidine is a constant constituent in all varieties of the dacites, varying in amount from ten to twenty-five per cent. of the whole of the feldspars, and is usually distributed in a fine state of division through the ground-mass. The structure of the quartz-bearing andesite (hornblende andesite) admits of its being divided into three groups: granitoporphyritic, porphyritic, and trachytic, the latter much resembling the true trachyte. The sanidine in these varieties never exceeds in amount fifteen per cent. of the feldspar; the hornblende crystals are very distinct and terminated at both ends, and augite is often present.

**Footprints in Carboniferous Rocks of Pennsylvania.**—W. D. Moore describes in the *American Journal of Science*, 1873, No. 2, 292, some footprints occurring in the carboniferous rocks near Pittsburgh, Pennsylvania, which he refers provisionally to the genus *Cheirotherium*. The principal characters are, toes of the front foot three, directed to the right, of nearly equal length, thicker and shorter than those of the hind foot; toes of hind foot four, directed to the left; length of foot, 2½ inches to 3 inches. Mr. Moore has given these markings the name *C. Reiteri*. The sandstone bearing them is covered with mud-cracks and very beautiful ripple-marks.

### Botany.

**Morphology of Carex.**—At the meeting of the Linnean Society, March 6th, Mr. Bentham read some remarks on the homology of the perigynium of the female flowers of *Carex*, and the subject was again discussed at the meeting on April 14th. He suggested the theory that the perigynium and seta represent the stamens of the male flowers. It appears, however, to be certain that the seta is an axial and not a foliar structure and that when developed it usually bears rudimentary flowers, as in *C. pulicaris*. The perigynium under these circumstances can hardly be looked upon as perianthial. On the whole Kunth's view, according to which it consists of a single bract with anteriorly connate edges and bearing the ovary in its axil, is probably correct. Some botanists, taking into consideration the manifest bidentate condition of the perigynium, will still probably prefer to compare it with the two lateral bracts in *Calyptrocarya*.

**Phyllotaxis.**—In a paper read before the Royal Society on February 27th Dr. Hubert Airy propounded a most ingenious theory in explanation of the mode by which one system of spiral arrangement might be made to pass into another. He attached oak-galls in two rows along a stretched elastic band. When relaxed they roll up into a tight complex order, the degree of condensation, and therefore the amount of tension of the axis, being dependent upon the distance which separates the balls from the axis. So far this is excellent, but Dr. Airy proceeds to deduce from it that a two ranked arrangement was the primitive one, and this hardly seems to carry conviction. It is possible that crowded rudimentary organs in the bud might eventually under pressure assume with a slight twist to the axis a spiral arrangement of a higher order. But without any pressure whatever a spiral arrangement of some kind would probably result from the development of lateral organs on a cylindrical axis because they are in that way most conveniently connected with internal structures.

**Ebenaceae.**—W. P. Hiern has published in the *Transactions of the Cambridge Philosophical Society* a most elaborate memoir upon this family. He enumerates 260 species, of which one hundred are new or not previously described. Of the five genera recognized *Taraleis* has been established for an undescribed Madagascar plant in the Paris Herbarium. The order has its focus in the East Indies, where 86 species of *Diospyros* and 19 of *Maba* occur; *Euclea* and *Royena* are confined to Africa. It is interesting to note that the order is unrepresented in New Zealand, Tasmania, and the Andine region—countries the vegetation of which has many interesting points of contact. Generally speaking *Ebenaceae* are strongest in the tropics in both the old and new worlds. *Diospyros Lotus* is an Asiatic species naturalized along the Mediterranean; *D. virginiana*, which is well known in the United States as Persimon, is nearly allied. Throughout the memoir any tendency to do more than carefully ascertain facts has been studiously suppressed. This becomes somewhat tantalizing in the account of the supposed fossil species. The author has been at the pains of drawing up a *clavis* of all the fossil remains which have been assigned to this order, good, bad, or indifferent—including even those for which it appears to him that *Ebenaceae* is not the probable family. A less cautious

expression of opinion from one who had critically studied the recent forms would have been valuable. Only two species seem on the whole to have much evidence in their favour—*Diaspyros brachysepala*, which has been found in miocene deposits pretty widely from Greenland to Italy, and *D. Auricula* from the eocene at Radoboj.

**The Origin and Affinities of the Raspberry.**—F. W. C. Areschoug points out (*Journ. of Botany*, April, 1873) that the raspberry so common in Northern Europe stands apart from all European species of *Rubus* in having its fruit separating from the receptacle and the bark scaling more or less completely from the stem in the second year. Although *R. Ideus* is a variable species it never produces forms connecting it with the others which are found in Europe; it is therefore considered to belong to a distinct type which is probably descended from some older form with simple leaves. The variety known as *R. Lævis* is either allied to this primitive form or is a reversion towards it. In N. America *R. strigosus* represents *R. Ideus*, and as both species meet in Japan and Manchuria, Areschoug believes them to have originated there, the ancestral form being probably now extinct. *R. strigosus* is indeed considered by Maximowicz to be merely a variety of *R. Ideus*; From Japan the former spread eastward, the latter westward. The European herbaceous brambles are supposed by the author to belong to an older Flora than the fruticosæ. Their tendency to form varieties is very restricted, and they have probably had time to exterminate the related forms which were possibly developed with them from their common ancestors.

**New Potato-disease.**—At the meeting of the scientific committee of the Royal Horticultural Society, April 2nd, the Rev. M. J. Berkeley stated that the fungus described by Hallier (*Academy*, iii., 135) was perfectly well known. Tulasne figured it in his *Fungi Hypogæi* under the name of *Rhizoctonia*. It was known as the "copper-web" in the Isle of Ely, where it was very destructive to asparagus.

### Philology.

**The Odyssey of Homer.** Edited with marginal references, various readings, notes, and appendices, by Henry Hayman, D.D. Vol. II. Books VII. to XII. London: David Nutt. 1873.

THE present volume of Dr. Hayman's *Odyssey* is introduced by a preface of considerable length and interest on the still unexhausted subject of the date of Homer. The occasion of the discussion is furnished by a theory recently put forward by Mr. F. A. Paley, according to which "the poems we now possess were compiled, that is to say were put together, in their present complete and continuous form at some period not very long before the time of Plato;" being "the work of an Ionic compiler of the school and age of Herodotus and Antimachus, or very little before that time." If this is so Wolf in ascribing the composition of the *Iliad* to the time of Pisistratus committed the error of placing it too early by about a century. Also he was wrong in supposing that it consists of older lays merely strung together by Pisistratus and his friends; for Mr. Paley thinks that the compiler "so remodelled the portions which suited his purpose as to put them into the language of his time, which differs in no respect from the Ionic Greek of Herodotus." Consequently when Herodotus quotes the *Iliad* and *Odyssey* he refers to two poems which are not now extant in their original form, and which in fact were at that very time (or very little before that time) going through a process of remodelling and translation into the dialect of Herodotus' own work. The compiler, Mr. Paley suggested, was Antimachus, a poet of Colophon, who is known to have made a *diorthosis* or corrected edition of Homer. It is certainly difficult to see how the compilation, on Mr. Paley's theory, could be the work of any one else. If Antimachus was either the compiler or at least of the "same school and age," he either edited his own remodelling of the older poems or he edited the compilation of a contemporary. The latter supposition is so improbable that we are thrown back to the former. It is said, indeed, that Antimachus came to recite his poems at Athens, and that his audience by degrees stole away until no one was left except Plato. The anecdote may be apocryphal, but it could hardly be true, and still less could it have been invented, of the "compiler" of the *Iliad* and *Odyssey*. But we are anticipating.

It was due to Mr. Paley's position as a scholar that some one should undertake the task of refutation, and Dr. Hayman has accordingly entered the lists. Out of the abundance of proofs of the antiquity of Homer which start up on all sides he has selected a sufficient number for his purpose, and has thrown them into the form of a reply to Mr. Paley's arguments. Those who remember the interesting paper which he wrote some time since in the *Contemporary Review* will perhaps regret the necessity of giving a controversial form to his present preface. But Dr. Hayman could not do otherwise without appearing to shrink from meeting Mr. Paley on his own ground. Several of Mr. Paley's arguments are derived from a comparison of Homer with the Greek poetry of the fifth century B.C. He maintains that Pindar and the Tragedians do not show acquaintance with "our Homer," and do show acquaintance with other ancient "so-called Cyclic" epics. The former of these positions is somewhat paradoxical. It is true that the Greek poets seldom, if ever, expressly quote Homer, for poets do not usually quote their predecessors; but the great extent to which Homer has influenced all subsequent Greek poetry has long been a commonplace of criticism. As to the latter assertion it is enough to say, as Dr. Hayman does, that there is no direct reference to Cyclic poems in Pindar and the Tragedians. Mr. Paley assumes that every legend

mentioned in later Greek poetry must come either from Homer or from a Cyclic poem. In the former case it is easy in general to point to some difference which will justify him in saying that the poet does not follow "our Homer." In the latter case it is seldom possible to prove any difference (the Cyclic poems having almost entirely perished), and accordingly Mr. Paley infers as complete agreement as he pleases.

Here, however, Mr. Paley neglects an important part of the argument. He makes no attempt to determine the subjects and character of the Cyclic poems themselves, and hardly seems to know that anything has been done in this direction. Yet the whole question of the relation of the Cycle to Homer on the one hand and to Tragedy on the other has been elaborately examined by Welcker, and his views have been adopted, though with large modifications, by most subsequent scholars. It is strange and hardly creditable that the name of Welcker is not mentioned in this controversy. Had Mr. Paley's own researches led him over the same ground we might have felt glad to have his independent results. As it is it would be difficult to say from Mr. Paley's writings what value he would assign to the various materials on which Welcker founded his theory. In the second volume of his *Iliad* he gives the story of the Troica, compiled "from Pindar and the Tragics" (*i.e.* Tragedians), and compares it with Homer. Why does he not also compare it with what is known of the Cyclic poems? The assumption that the legends found in the later poets are the same as those which formed the Epic Cycle is a *petitio principii*, and is the fallacy which vitiates his whole reasoning. As a matter of fact the legends which received literary treatment from the early epic poets were probably a mere fraction of the whole mass of legends current throughout Greece. The Lacedæmonians, says Herodotus, give a version of their early history in which they agree with no poet. There is no proof, to take a single example, that the Oresteia ever formed the subject of an epic. Again, of the whole narrative thus adopted for poetical use the *Iliad* and *Odyssey* form a very small part, the story of a few days out of many years. It is no wonder, then, that the Tragedians did not always choose legends from the Epic Cycle, and when they did choose such legends they did not often resort to the *Iliad* and *Odyssey*. We need hardly add that though the Tragedians took their plots from well-known mythical stories, they would naturally avoid the most familiar of all. It is curious that out of the plays taken from distinctly Homeric subjects a large proportion are Satyric dramas, *i.e.* in effect, parodies.

An important chapter in this controversy is occupied by the evidence derived by Mr. Paley from the remains of ancient art, especially the paintings upon early Greek vases. These paintings, he argues, show a remarkable absence of Homeric subjects and a preference for those which were or may have been treated in "Cyclic" poems. The same fallacy steals in here which has been already observed in the argument founded on the tragic literature. Mr. Paley denies direct connexion between Homer and the paintings because it cannot be proved; he asserts direct connexion between the Cyclic poems and the paintings because it cannot be disproved. In the latter case the explanation, as before, is simple; the poems do not exist. In the former Dr. Hayman has hit the point by arguing that paintings were not meant to illustrate *poems* but *legends*. The distinction is vital, and is worked out by him with great discrimination. The legends were essentially local; in the age of the vase-paintings they had assumed forms which removed them in many cases from the Homeric type; the heroes whom they celebrated were not the heroes of the older epics, heroes of

Thessaly, of Achæan Peloponnesus, and other ancient seats of power, but were those of historical Greece. All this is admirably shown by the account given by Pausanias of the most famous work of early Greek art, the chest of Cypselus, to which Mr. Paley had himself appealed. The chest (probably as old as 600 B.C.) contained representations of "all the more notable legends of Dorian Peloponnesus and Ionian Attica"—the enumeration may be omitted—and "besides all these several scenes from Homer" (p. xliii). "There are five which Pausanias recognised as illustrating our Homer, and apparently designed to do so," while "there is no suggestion or reason for supposing that the other designs bore a like reference to any other poet" (p. xliiv). Since Pausanias frequently quotes the Cyclic poets elsewhere, this goes a long way to prove two points: first, that the subjects of early art were not usually taken from poetry, but from local unsung legend, and secondly, that if there was any poet of sufficient fame and interest to gain a place beside these local legends that poet was the author of the *Iliad* and *Odyssey*. After this it seems a waste of time to argue the matter further. Dr. Hayman's conclusions regarding the vases are simply these: "Homeric subjects appear as soon as groups appear, they are adequately represented, they are even much more" (p. lii). This he shows by a detailed account of very many examples.

Dr. Hayman next examines Mr. Paley's arguments from the language of Homer. He has little difficulty in showing that not only Herodotus, as Mr. Paley maintained, but all the poets, from Archilochus down to Æschylus, are full of Homeric language. This meets the particular argument derived from the coincidences between Homer and Herodotus. Mr. Paley's other arguments under this head are easily disposed of by a simple inspection of the facts. There is nothing more certain in the results of comparative etymology than the high antiquity of the Homeric language, as compared not merely with Herodotus and Attic writers, but also with Archilochus, Pindar, and the Elegiac and Lyric poets generally. Dr. Hayman shows this for the use of the Digamma and the article; and the argument admits of being carried a good deal further. To state it fully would be to recapitulate nearly all that comparative philology has done for the Greek language.

The references to the *Iliad* in Herodotus need not detain us. Dr. Hayman seems here to understate his case. "Where," he asks, "is the difficulty in our finding Herodotus ascribing to Homer, in the *Iliad*, a statement that Paris, in his abduction of Helen, wandered from his course to Sidon and elsewhere?" Where, indeed, when we have the line

Ἥγαγε Σιδονίηθεν ἐπιπλῶς εὐρέα πόντον

quoted by Herodotus himself? Dr. Hayman has happily explained another passage of Herodotus which even Mr. Grote stumbled over, that namely in which it is said that Cleisthenes forbade the recitation of Homeric poems at Sicily because they were all about Argos and the Argives. The words Ἀργος and Ἀργεῖοι are not used in Homer quite in their later sense, but they occur often enough to account for the jealousy of a tyrant of Sicily.

The geography of Homer is next discussed. The catalogue in the *Iliad* fixes with tolerable certainty the Greek geography of the heroic period: the *Odyssey* allows us to see how far the poet's knowledge extended into neighbouring countries. In both we find abundant proof of antiquity. The great historical races, the Dorians and Ionians, are among the most insignificant in Homer. Such names as Thessaly, Peloponnesus, Europe, Asia, are unknown. "We have no hint at the existence of Cyrene, the legends connected with which fill so many glowing pages of Pindar." The colonies in Italy and Sicily were settled from 800-600

B.C., yet the Homeric geography in this direction is of the most "phantom" character. In short, we can trace a marked advance in geographical knowledge between Homer and Hesiod, and again between Hesiod and Æschylus.

Some of the clearest proofs of the great antiquity of Homer are derived by Dr. Hayman from the mythology. In several cases he shows that we can trace "successive deposits of mythus: the simplest the Homeric, and therefore probably the oldest." Among these may be named the stories of Pan, of Dionysus, and of Herakles. The last instance is especially interesting. Herakles in Homer is a mere man; a hero of an older generation, and a son of Zeus, but as mortal as Achilles or Sarpedon. The only passage which recognises him as divine is in the *véκνία* of the Odyssey (II. 602-4) in a part of the book which bears every mark of later addition. All his adventures in Homer have a simple human character. In later poets we find him delivering Alcestis, releasing Prometheus, fighting with the Giants, founding the Olympian games (which are unknown to Homer), passing to heaven from Mount Ceta. This progress from the local and human to the divine and universal may be traced in the poem celebrating his exploits. First there is the ancient "Cyclic" poem attributed to Homer, the "Taking of Echalía." The subject of this poem is a single military expedition, in which he is victorious, in his Homeric character of an invincible archer. Then we have the "Heraklea," of Pisander, giving the Twelve Labours, and arming him for the first time with the club of later art. Finally there is the late epic of Panyasis, which related all his adventures. Similar remarks apply to other heroes, e.g. Theseus, Bellerophon, the Dioscuri, and indeed to hero-worship generally as a post-Homeric institution.

Out of many instances of post-Homeric mythology given by Dr. Hayman one other may be noticed, the sacrifice of Iphigenia. Not only is this tragic event wanting in Homer, but the very name of Iphigenia (as of Electra) is unknown to him. The incident, however, as Dr. Hayman might have pointed out, was related in the Cyclic poem called the Cypria, and thus forms one of the many points in which the Cyclic poems stand midway between the Attic poets and Homer.

Dr. Hayman's notes to the part of the Odyssey now published (Books vii—xii) can hardly have justice done them in a brief article like this. They contain a great deal of interesting and varied information, put together in the manner of an intelligent amateur rather than of a professed *savant*. For grammar and construction they are less satisfactory than the notes in Mr. Merry's school edition. It cannot be right to construe *ἑῶν τ' ἐν φρονέησι καὶ ἀνδράσι νεῖκεα λύνει* (vii. 74) "between (those women) whom she discreetly advises and their husbands she reconciles differences," although that explanation is given by a scholiast. With this reading (which is more than doubtful) we must render "She reconciles differences among the husbands of women whom she favours." Again in the well-known place, (viii. 74) *οἴμης τῆς τὸτ' ἄρα, κ.τ.λ.* Dr. Hayman says rightly that *οἴμης* is attracted into the case of the relative, but he does not notice the real difficulty, viz., from what construction *οἴμης* is attracted. At viii. 283, *εἶσατ' ἵμεν* he does not say whether *εἶσατο* comes from *εἶδομαι* or *εἶμι*. His etymology is of a somewhat pre-scientific character. Thus he makes *τεχνήσαι* an aorist infinitive: and says that *νῆις*, i.e. *νῆφις*, contains the old English verb-stem "I wis" and the German *wissen*, elsewhere found to involve *δ*, as in *ἄφιδρείησι*, *φοῖδα*, and *video*. Apart from the contempt thus poured upon Grimm's law it seems obvious to remark that *νῆις*, gen. *νῆϊδος*, only "involves" final *ς* in the same way that *ποῦς* (*ποδός*) and every other nominative does so. In an appendix on the pronoun he seems to think that the article *ὁ* and the

relative *ὅς* are the same. Comparative philology is not necessary for interpretation, but it is necessary for derivation.

D. B. MONRO.

*Codex Frisianus*, en samling af Norske Konge-Sagaer udgivne efter offentlig foranstaltning. Christiania, 1871. (By Prof. C. R. Unger).

THE *Codex Frisianus* is the only remaining vellum of the *Heimskringla* which survived the fatal fire of 1728; it bears its name from a Danish nobleman, Chancellor Fris, who at the beginning of the 17th century possessed the book. It is written in an Icelandic handwriting, about the end of the thirteenth century (rather than the beginning of the fourteenth), but seems soon to have come out of the country and to Norway, for its parchment is unusually white, whereas Icelandic vellums are mostly grimed with soot (black as smoken hams) from the smoky rooms in private Icelandic dwellings. It is a curious incidence that the translation of 1550, by Lauritz Hanson, was made from this very MS.: proof of this is contained in a phrase at the very beginning of the book, where a word in the vellum is superfluous, and then marked as usual with dots underneath the line, "*ganga stor havf or vt hofvm sianom*." Now the same repetition is found in the translation.\*

Later on, whilst the other vellums were in an evil hour incorporated into the University library and met there an untimely end, this MS. happily came into the possession of Arne Magnusson, and is at present under No. 45 fol. of the Arne-Magn. Collection. It contains the *Heimskringla* text, with preface and all, down to King Olave (St. Olave); it then skips over that saga, noticing, "St. Olave's Saga should be put in here," column 145, page 167 of the Edition. It then continues the sagas down to Sverri, but differs, especially after King Harold Hardradi, considerably from the vulgate text of the *Heimskringla*, both in text and in disposition of chapters and episodes. It contains now and then several new things: thus in the little episode of the fisher Thorgils and his capping verses with the king it adds a few new phrases and one or two new verses which are not found even in the complete text of the Hulda. At the end of the so-called *Heimskringla*, the work runs on, but without Sverri's Saga, and the writer passes over to the saga of King Hakon, which is given in a large abridgment (p. 387-983), and complete to the end; this text has served as the groundwork of all the former editions of that saga. The text of this saga used by the transcriber (and abridger) must have been a good one, and even contains at least one episode not recorded in any other existing recension of that saga, viz., the king's touching interview with the queen, his wife, in the very night when he received the first express message of the rebellion raised by her father, Duke Skuli, the king's father-in-law (Edition, page 500).

The Edition is a faithful reprint of the vellum, both text and spelling, yet writing in full all the abbreviations; it is published (as a part of the same series of sagas as the Flatey-Book a few years ago) by order of the Government (*efter Offentlig Foranstaltning*), and is accompanied by a brief preface, and by a list of names. The editor is Prof. C. R. Unger, although the text has been transcribed by another hand. The editorial work and get-up, and the paper and printing are plain, correct, and satisfactory.

G. VIGFUSSEN.

\* See the facsimile in the old folio edition of the Hkr., vol. i., at the head of the preface. The editor has not noticed this in the foot-notes, as being too irrelevant, but sometimes even errors such as these may lead us to truth in tracing MSS.

## Intelligence.

It was the intention of the late Professor Goldstücker to bring out, as president of the Philological Society, an Annual Report on the Progress of Philology during the year; and we are glad to learn that the present President (Mr. H. J. Ellis) proposes to carry out this design, and to introduce at the approaching anniversary meeting of the society a report relating to the years 1870, 1871, and 1872, with a view of in future confining the Annual Report to the twelve months ending at the previous Christmas. As the task of reporting on the progress of philology in all its branches is a vast one, Mr. Ellis has invited members conversant with any special department of philology to aid him with their contributions. The reason for beginning with 1870 is that the introduction to the fourth volume of the second part of the second edition of Pott's *Etymologische Forschungen* contains a condensed systematization of philological researches in all their branches, accompanied by a catalogue of the principal works published up to the end of 1869.

Dr. Ethé, who is now engaged in cataloguing the Persian MSS. in the Bodleian Library, has been so fortunate as to discover a number of lyrics ascribed (and apparently with justice) to the great master of Persian poetry, Firdûsi. The text has been published with a metrical translation in the Transactions of the Bavarian Academy. We believe Dr. Ethé has since then found one or more Kasidas, also attributed to the poet of Shahnameh.

We regret to learn the death of Dr. Lotmer, well known as a Sanskritist and comparative philologist, and late Professor of Sanskrit, and Assistant Librarian in Trinity College, Dublin.

The *Athenæum* says that the first issue of the Early English Text Society's books for this year will go out at once, and will consist of—1. In the original Series, Dr. Richard Morris's edition of the unique twelfth-century Homilies in Trinity College Library, Cambridge, with a photo-lithograph by Cooke & Fotheringham, and three unique thirteenth-century hymns to the Virgin and God, from the Corpus Library at Oxford, with musical notes, photo-lithographed by Taunt, transliterated (or transnoted) by Mr. A. J. Ellis, and modernized by Dr. E. F. Rimbault.—2. In the Extra Series, Part II. of the "Complaynt of Scotland," A.D. 1549, edited by Mr. James A. H. Murray. All the year's books are in type. The second issue is expected in June, and the third in September.

The same journal also states that M. Mariette has returned to Paris from Egypt, and has brought with him the fourth volume of his work on Denderah, the second of his Abydos, the third of the papyri, and forty plates for his collection of monuments. He has found the remains of the great Temple of Ptah or Hephaisteum, at Memphis. The activity of the French Egyptologists will be further seen from the proposed publication of the monuments of the Louvre by M. Maspero.

## Contents of the Journals.

*Journal Asiatique*. VII. Série. Vol. i., No. 2. Février-Mars, 1873. —'Abd ar-Razzâq, et son Traité de la Prédestination et du Libre Arbitre, par M. S. Guyard. [Biographical notice of this independent Sufic theologian and analysis and translation, from a manuscript in the possession of the writer, of his treatise in which divine prescience is reconciled with free will by the demonstration of a moral responsibility. According to Haji Khalifa this author died in the year 887 of the Hijra; but Sprenger, in his edition of 'Abdar-Razzâq's dictionary of the technical terms of the Sufies, has shown that this is a mistake and that he must have lived between 716-736 of the Hijra (A.D. 1316-1335). The writer of the present paper adduces further proof for the correctness of Sprenger's opinion.]—Le Concile de Nicée, d'après les textes coptes. Exposition de Foi. Gnomes du Saint Concile. Par M. E. Revillout. [Among the papyrus collection in the museum of Turin the writer has discovered two fragments, one of which relating to the dogmatic part of the Nicæan Council—it contains the whole of the symbol with anathemas and explanations—the other containing a treatise, also referred to the same Council, on Christian morals and conduct. Of the latter Zoega knew only the title and the first page. The former, being in Coptic and Greek, completes the fragments which Zoega found in the museum Borgia; and shows that the original was not, as M. Lenormant supposes, Egyptian, but Greek. From the high age of the MSS. M. Revillout infers that the Coptic recension was not much posterior to the Council. The Coptic text and a French translation of the two fragments are here given.]—Nouvelles et Mélanges. Pontcuer les Phrases dans les Langues Musulmanes. A letter from Baron P. G. Du Mast to M. J. Mohl. [Argues for the introduction, with some modifications, of the European signs of punctuation into Semitic texts.]—Notices (favourable) of Mr. Denny's *China Review*, No. i. (by G. P.); Rājendralāla Mitra's and G. Bühler's *Catalogues of Sanskrit MSS.* (by J. M.); Mirza Habib d'Istāhān's *Destouri-Soukhan*, la règle du langage, ou mieux *grammaire arabo-persane, écrite en persan* (Constantinople, 1872) (by M. Belin); and H. Wuttke's *Geschichte der Schrift und des Schriftthums*, vol. i. (Leipzig, 1872) (by J. M.)

*Journal of the Royal Asiatic Society*. Vol. VI., Part II. 1873.—On Hiouen-Thsang's Journey from Patna to Ballabhi; by J. Fergusson. [The writer finds reason to distrust the principles of criticism hitherto adopted by those who have tried to trace the route of the Chinese pilgrim. In his opinion there is no necessity for altering the text of those travels in a single instance, either for direction or distance; but, on the contrary, the indications are quite sufficient to determine, within very narrow limits of error, the position of the places mentioned. The discrepancies between his conclusions and the identifications of those who preceded him in this inquiry are so great that the question is evidently one of principle rather than of detail. The most interesting portions of the paper are those relating to the two stages, from *Hiranyapāravata* to *Kāmarūpa* and thence to *Kālinga*. The pilgrim's *Kāncīpura* is here identified with *Nagapata*, not with *Conjevaram*.]—Northern Buddhism; [note from Col. Yule with extracts from a letter from Mr. B. H. Hodgson on a mutilated figure of Padma Pani from Surakarta.]—Hwen-Thsang's Account of the Principalities of Tokharistan [note on a former paper by Col. Yule.]—The Brihat-Sanhitā; or, Complete System of Natural Astrology of Varāha-mihira. Translated from the Sanskrit into English by Dr. H. Kern. [Continued; Chapters liii. to lxiv.]—The Initial Coinage of Bengal under the Early Muhammedan Conquerors; by E. Thomas. Part ii. [This part embraces the preliminary period between A.H. 614-634 (A.D. 1217-1237). The material for this paper was supplied, by a collection of silver coins recently discovered near the fort of Bihār.]—The Legend of Dipankara Buddha; by S. Beal. [Translated from the Chinese of Djinakūta, a native of Gandhāra in N. India who lived in the time of the Sui dynasty (518-617 A.D.) The legend is supposed by the translator to illustrate plates xxix. and l. of Mr. Fergusson's *Tree and Serpent Worship*.]—Contributions towards a Glossary of the Assyrian Language; by H. F. Talbot. Part iii. [Vocables 292-515.]

*The Indian Antiquary*, edited by J. Burgess. Part XIII. Bombay, January, 1873.—Chaitanya and the Vaishnava Poets of Bengal; by J. Beames. [Account of the founder of the *Vaishnava* creed, *Chaitanya*, born in A.D. 1486; and extracts from the *Padakalpataru*, a collection of Bengali hymns ranging from the 15th century downwards; the earliest poets being Vidyapati and Chandi Dās.]—On the Rude Stone Archaeology of the Hassan District, Mairur; by Capt. J. S. F. Mackenzie. [The writer complains of the indiscriminate use of the various terms of pre-historic monuments such as *cairn*, *kistvaen*, *cromlech*, *stone circle*, and *dolmen*, and lays down distinctions for them; after which he proceeds to describe the various kinds of remains found in the Hassan district.]—Notes on Junnar Taluka, Puná Zillā; by W. F. Sinclair. [Account of interesting localities of that district.]—Notes connected with Sahet Mahet; by W. C. Bennett. [Some local traditions regarding the history of Srāvasti.]—Notes on Witchcraft and Demonology in Gujerat; by Capt. E. West. [The local superstitions count five demons who may get possession of human beings, one of them being of the male, the others of the female sex.]—Papers on Satrunjaya, &c.; by the Editor. [Account of the Jaina sect.]—The Desisabdasangraha of Hemachandra; by G. Bühler. [This work of the great Jaina writer of which Dr. Bühler has discovered a MS. promises to supply an abundance of new material for Prākṛit philology; it being a glossary of about 4,000 Prākṛit words with their Sanskrit equivalents. A specimen of the *kośa* is given.]—Memorandum on the Shoe Question as it affects the Pārsis; by Rev. J. Wilson. [On the aversion of Pārsis to the taking off of shoes when entering public or private houses.]—The Prithirāja Rasau of Kavi Chand Bardai. [Extract from the fifth book.]—The Canarese Country compared with the countries adjacent to it; by Rev. F. Kittel. [Translated from the Canarese of Sarvajna, born at Ambalūru about two centuries ago.]—Notes concerning the Numerals of the Ancient Dravidians; by Rev. F. Kittel. [The Dravidian numerals from one to a hundred are independent of Aryan influence; whilst the word for thousand was borrowed from the Sanskrit *sahasra*.]—Notice of Colebrooke's Miscellaneous Essays, second edition (Madras, 1872). Correspondence and Miscellanea. [On the Khatri, by Kāsi Nath.]—On Early Indian Buildings, by J. Fergusson.—On the Sabdachintāmani, a Prākṛit grammar by Subhachandra, by A. F. R. Hoernle, &c.]

## General Literature.

*The Gallery of Pigeons and other Poems.* Theophile Marzials.  
Henry S. King & Co.

MOST people have had dreams which they wished to remember at waking ; some have had the fortune to write down their dream before it was broken : unhappily the result is seldom satisfactory. Mr. Marzials' volume has so much of the charm which we expect from a remembered dream that it seems as if it were unreasonable and ungracious to notice the abruptness and incoherence which sometimes make the book as disappointing as a dream recorded. It is easier to be sure that the book is brilliant—and it is in some ways very brilliant indeed—than that it is enjoyable ; and yet it contains as clear evidence as a book can contain that its composition was a source of keen and legitimate enjoyment. The rush of fresh sparkling fancies is too rapid, too sustained, too abundant not to be spontaneous ; only to us who have not the fountain within us there may come a sense that a brook whose course we can trace, though it is neither very bright nor very deep nor very swift, is more refreshing than volumes of spray that are only thrown up to fall down again, though it may shine, as Mr. Marzials' verse does shine, with more colours than the rainbow. This of course is a question of taste, but the fact remains that the interest of the book before us lies apart from most of the ordinary interests of poetry ; it does not depend upon thought or passion, still less upon character or incident ; it does not depend even upon the attraction of some contagious mood : it depends simply and solely on the endless combinations of wonderfully vivid perceptions and the picturesque inventions of a joyous fancy. Picturesque and vivid are only words—they are not definite enough to give a clear conception of the peculiar quality or the peculiar limits of the pleasure to be found in it ; if it is not irreverent to illustrate works of art from toys, we might perhaps venture to say that the picturesque of Mr. Marzials reminds us of a kaleidoscope, and a magic lantern reminds us of the picturesque of Mr. Morris.

Another contrast that suggests itself is between the nine sonnets entitled "Love's Masquerade" and the series of sonnets in Mr. Rossetti's *House of Life*, and it suggests

itself the more naturally because, though the younger poet is thoroughly independent, there is too much resemblance for the hypothesis of suggestion to be wholly impertinent. "Love the Ideal" is perhaps the best of them.

"At noon when every dame had sought her bed  
High in an oriel, peacock-plume in hand,  
And mapped beneath her all the varied land,  
Dreaming from out her dainty book she read,  
Till of a sudden, with a flamegirt head,  
The one she dreamed of, on light pinions fann'd  
Over the sill, did gently swoop and stand  
Beside her, quivering for her full mouth's red.

And in his warm god's arms her cheeks so glow'd  
She hardly mark'd how, writ in rose and gold,  
Her own life's page was past, and hardly show'd  
Then with a cry he vanish'd—shivering cold  
The night wind swept the corridors ; the bell  
Boom'd for one dead, down from the spired chapelle."

One cannot say that there is no thought or passion here ; one certainly could not say that there is no colour in "Willowwood ;" only in Mr. Rossetti's work the inward thought and passion are supreme, in Mr. Marzials' work the outside pictorial fancy is supreme instead. Not that he is incapable of conceiving a subject from within : the outrageously quaint little poem called "A Tragedy" is an audacious attempt to make the fancies of a girl who is drowning herself off a London bridge articulate ; the attempt has been carried through with a curious truth of sympathetic insight into the scared sensations which must take the place of thought at such a crisis ; yet the result is hardly a success, it makes the victim too ridiculous.

Some of the pleasantest things in the volume are to be found among the thirty odd pages of short poems (mostly very short) which are placed after "Love's Masquerades" under the headings Bagatelles, Tragedies, Majolica, and Rococo, which have often, as in "A Court Minstrel," a graceful irony which serves to prevent the pretty conceits from cloying. Even though the author accepts it, "conceits" seems a harsh name for the exquisitely tender fancies about stars which begin—"There's one great bunch of stars in heaven," or for this which is the last of the "Tragedies."

"In the warm wax-light one lounged at the spirit,  
And high in the window came peeping the moon ;

At his side was a bowl of blue china, and in it  
Were large blush-roses, and cream and maroon.

They crowded, and strain'd, and swoon'd to the music,  
And some to the gilt board languor'd and lay;  
They opened and breathed, and trembled with pleasure,  
And all the sweet while they were fading away."

Such a delicious little snatch of fanciful pathos appeals to everybody; it makes so little claim on the attention, and yet it is so sweet. "A Nocturne" would give every reader who cared for poetry a pleasure that would not be the less singular because he was reminded both of Keats and Mr. Browning. "A Pastoral" opens with a reminiscence of the song in Fra Lippo Lippi which ought to have been repressed, and in "Gabrielle" Mr. Swinburne's favourite motive of voluptuous cruelty is very skillfully transposed out of the key of passion into the key of fancy. When we come to the longer poems it is different; to enjoy them we need not only an appetite for beauty which can dispense with anything like intellectual interest, but a sustained buoyancy of temperament which is rarer still. It may be the author's fault or ours, but if the volume as a whole leaves something of the impression of a kaleidoscope, the "Gallery of Pigeons" leaves the impression that the kaleidoscope has been broken and the bits of glass have fallen out; the bits of glass are very pretty, and they will do as well as ever if only we have a kaleidoscope of our own to turn them in. Seriously, thirty-nine pages is a great deal of space to spend upon the conceit that a lady has a cage full of pigeons which are her "pretties," and lets them out in the morning and shuts them up at night, and that her poet has a heartfelt of fancies which are his "pretties," and as she warns him never come back when he lets them out to praise her. "Parsconete Dowsabella" is better; if we care to attend at all to a country girl who keeps a rendezvous in a lane, sees her lover with somebody else at a dance, and goes out to drown herself, we shall be rewarded for our pains by a profusion of admirable imagery. If the situation is poor and common so far as ethical or intellectual interest goes Mr. Marzials does nothing to enrich it; but for some reason or other it obviously interests him, and he has imagined the physical details of its every moment with an opulent intensity of sympathy which leaves nothing to desire. On the whole we are inclined to place "In the Temple of Love" first among the longer poems. A lover brings his offering to the temple and has a dream there, and wakes and goes away. Both the introduction and the epilogue are very beautiful, especially the epilogue, and please us better than the dream itself, though they are quite in tune with it and enhance its value. The lover dreams he is among lovers who climb a strange mountain and come down over a strange plain to a strange shore, where they dream of being eaten by crocodiles and of being drowned, and wake and dream of dying. The whole thing has a sort of weird, irrational truth and charm about it, and it would be easy to pick out many fragments as picturesque and as musical as this:—

"White  
Over the black sand hill  
The large white moon rose into sight,  
The gliding moon in ghastly light,  
Till all the desert plain grew white,  
And white the air, and yellow and white,  
And shimmering grey, and glimmering white  
That filmed along so soft and still."

What can be more soft and vivid? and yet it is not faultless; the writer caresses his own sensation in a way that might easily stiffen into affectation, and it is hardly a sign of mastery of language to turn substantives into verbs without limit, nor is this the only direction in which Mr. Marzials has attempted innovations which suggest a wish that he had

been content to leave our language as he found it. But the real defect of most of the poem is that it is too dreamy to be quite worth reading when we are wide awake; it is full of hitches and repetitions and abruptnesses, just as dreams are, and these of course are intentional, but though they may be true to sleep they are hardly true to art; perhaps too, though these perilous graces have in some sense a right to be there, they presented themselves uncalled. "The Rose of the World" would have been a beautiful poem if its stanzas had grown together visibly out of an organic idea instead of being linked together by unconscious cerebration. However, it would be more than unjust to imply that the author is content to let inorganic prettinesses flow in upon him at random. Though "The Angel of God in the Garden of Phantasy" is a mere swarm of brilliant pictures which crowd each other out, yet the Angel does preach the poet a lesson of concentration, and when the lesson has been learnt a writer of such keen and bright perceptions ought to be a delightful and admirable poet: at present, to speak frankly, both our pleasure and his power are washed away too often in a tepid gush of incoherent ineffectual ecstasy.

G. A. SIMCOX.

Pictures of Danish Life. [*Genrebilleder. Af Carl Andersen. Ny, samlet Udgave.*] Copenhagen: Gad.

MR. MATTHEW ARNOLD speaks somewhere of the sweetness of the intellectual repose that comes to a nation when a great school of "beautiful souls" has passed away into the distance. No language can produce men of genius with the same incessant activity with which Stromboli pours out its ceaseless lava-fires; there is always a pause in which the grass grows over the most startling innovations, a quiet interval in which the voices of those who are not trumpet-tongued can be heard, and this hushed period often produces very graceful writers. Denmark is now enjoying such a pause; its literature is not asphyxiated, like the Swedish, choked with the fumes of one great poisonous masterpiece, but simply resting after the labours of the last generation. Christian Winther, F. Paludan-Müller, and Hans Andersen, poets of whom any language might be proud, are old men, and no colossus has risen up since their day. The two men that lead among the younger poets are, as might be expected, rather eminent for gifts of delicate execution and graceful sentiment than for anything very great in the higher paths of imagination; nevertheless there is much of original, quiet beauty in contemporary Danish verse. Christian Richardt's manipulation of the language, as shown in his three little collections of lyrics, is masterly, and he has solved, what is so difficult a question with modern poets, how to win the popular ear with strictly artistic verse. Carl Andersen has been a much more profuse writer than Richardt, and has not always written with so much precision and grace; but his sensitive and highly trained eye for all that is beautiful in nature, the purity and freshness in tone of all that he does, and a certain pathetic delicacy in the treatment of old-fashioned themes secure him a prominent place in the literature of his day.

We are glad to welcome this collected edition of Carl Andersen's *Genrebilleder*. The book itself, with its primrose-coloured cover and the peculiarly appropriate and poetical design on the same, is in keeping with the graceful and delicate contents. These Pictures of Danish Life are not in verse, they are in very carefully written and semi-rhythmic prose that is even more appropriate to their character than verse would be. They are little prose sonnets, if one may say so, little poems, each complete in itself, and each formed around one thought

or scene or human impulse. Some are mere fantastic visions, some are homely pictures of still life, full of warm colour and subdued sunlight, like De Hooghe's delicious interiors; others, and these perhaps are the most exquisite of all, are sea-pieces, studies from the picturesque sailor-life which forms so large an element in the Danish individuality. "Maiden Else" is one of the most charming of these. Maiden Else is presented to us as a very old woman wearing out her days in the workhouse at Elsinore. The last morning that she ever rises the fatigue of dressing is too much for her strength, and she falls asleep at her bedside in the sunshine. There her last dream is described to us: her sunny early life as a fisherman's daughter, her childish games and playfellows, the shadows that slowly fell over her life, and all her mild patience under grief and disappointment pass rapidly but distinctly before us; but the dream is not over before she faints away and is taken into her bed to die. No subject could well be more commonplace, but it is one of those in which Carl Andersen's quiet force and freshness find especial delight, and one feels one will not easily be able to forget Maiden Else.

Some of the pictures are painted in Iceland, where the poet was born. These are among the most interesting, as the most unfamiliar. There is something very instructive in the Icelandic character, preserving as it does a lofty intellectual and social standing in the midst of difficulties and hardships almost insupportable. We should be glad to see Carl Andersen choose some epic subject from the life of his fatherland. No doubt he would treat it with vigour and success.

The essentially modern spirit in poetry, the newest Renaissance, of which Heine may be said to be the prophet, has found no place yet in Denmark. The Norwegian poets are as modern as heart can wish, and their works are more read in Copenhagen than those of the natives themselves. But the Danes have a horror of what is German, and a contempt for the latest German poetry, and what is written in England and France they do not read. Some day soon, when the reaction is over, we may expect to see a new-world poet in Denmark; at present the Danish writers prefer to look back at Paludan-Müller and Oehlenschläger.

EDMUND W. GOSSE.

### Notes and Intelligence.

In a recent number of the *Academy* (vol. iv., p. 126) mention was made of new publications from Goethe's inedited correspondence, shortly to be edited under the direction of the heirs of the poet. The "Scientific Correspondence" of Goethe was collected by Goethe himself, and will fill two volumes; it comprises the years 1812-32, though most of the letters appertain to 1822-27. There are letters addressed to Goethe by Blumenbach, Carus, Loder, Sömmering, Seebeck, d'Alton, Brandes, von Henning, Martius, Nees von Esenbeck, Purkinje, Wernburg, and Zschokke. It appears from them that Goethe kept up the most lively and detailed interest in the progress of science and natural history until the latest period of his life. As this correspondence comprises more than one hundred different names, it is to be expected that not in all letters we should observe that peculiar intimacy of intercourse which appears in the correspondence of Goethe with Martius, or Nees von Esenbeck. The editor, Professor Bratranek, at Cracovia, has added chronological tables indicating the extent of Goethe's correspondence with each person independently of the letters now first published. He has, moreover, prefixed to the letters the various observations relative to the poet's judgments and opinions found in his Annals, and in the published works on his Conversation, &c. There is also a highly valuable index. Goethe's "Correspondence with the Brothers Humboldt" will form one volume. The letters exchanged between 1795 and 1832 by Goethe, and Wilhelm von Humboldt equal in general interest Humboldt's famous "Letters to a Lady Friend," and are of the same importance for German literature as the invaluable cor-

respondence of Goethe and Schiller. Eminent authorities assert that the editing of these two volumes will be found most masterly. Professor Bratranek is already favourably known as the editor of the Correspondence between Goethe and Count Kaspar von Sternberg (1866).

Dr. Michael Bernays, who is already well known by various important contributions to the criticism of the works of the principal German classics, has recently published an elaborate work on the history of the origin of Schlegel's translation of Shakespeare (Leipzig: T. Hirzel, 1872). Besides giving an elaborate account of the origin of this master-translation—which now appears to be not exclusively executed under the influence of the Romantic school, as is erroneously asserted in most works—the author shows on the basis of the extant MSS. that the translation was, in the first place, very carelessly printed and that there remain in it numerous errors to be corrected from an accurate collation of these MSS. Secondly he shows the *genesis* of the translation by producing from his MSS. the different shapes into which Schlegel had thrown this or that line before his final decision. These various readings are highly instructive with regard to Schlegel's poetical development, and attest the different influences under which he began and perfected his work, viz., that of Bürger, Herder, Schiller, and, above all, Goethe. There are also some ingenious aperçus on peculiarities of Shakespearian diction and some fine criticisms on the leading characteristics of some of his plays. Dr. Bernays is one of the few Germans that know how to combine in their writings both accuracy of detailed investigation and the greatest polish of form and style.

We may mention the appearance of a work by W. König on "Shakespeare as a poet, philosopher, and Christian" (Leipzig: Luckhardt, 1873). The most interesting and suggestive part of it is the parallel attempted between Shakespeare and Dante. We think, however, that the book labours under that over-suggestiveness so characteristic of many German works on Shakespeare.

The papyrus roll recently acquired by Dr. George Ebers at Luxor (the largest but two of those known to be in existence) has been purchased by the King of Saxony for the library of the University of Leipzig. It is in good preservation, legible throughout, and the fineness of the character alone would cause it to be assigned to the seventeenth century B.C. It treats of the "medicines for all diseases of all parts of the body," and besides prescriptions and charms—generally ordered to be used together—it contains full and minute descriptions of the diseases themselves and their symptoms. More than twenty affections of the eye alone are enumerated. Besides whatever points of antiquarian or mythological interest it may possess, it promises, according to Dr. Ebers, large additions to the vocabulary of Egyptologists. It is proposed to be published by Professor Ebers during the course of this summer.

According to Dr. W. Reiss, of Heidelberg, by whom the first successful ascent of the crater of Cotopaxi was made last November, the height of the mountain is understated in Humboldt's and other estimates. The barometer gave 19,660 feet, and separate trigonometrical calculations 19,496 feet for the northern and 19,427 for the southern summit respectively.

The publication of Feuerbach's literary Remains has been entrusted to Dr. Karl Grün; the greater part will be new to the public, containing the lectures which he gave as *Privat docent* at Erlangen, biographical notes sketching the course of his mental development, and a number of letters from distinguished contemporaries.

A series of papers by Count Gozzadini, president of the Regia Deputazione di Storia Patria per le provincie di Romagna, read at the sessions of the Society, on "The Towers of Bologna and the families which held them," are full of erudite details, referring in some cases to early and obscure times concerning which the smallest authentic detail may be of value.

"The Sons of Ham," in *Cornhill*, is apparently by a missionary, who, like most people who have seen the African

at home with unprejudiced eyes, believes that he alone of all the so-called inferior races has a certain and perhaps a creditable future before him. The same magazine, under the title "Louis Napoleon painted by a Contemporary," gives the late Mr. Senior's conversations with Mme. R., a lady who was brought up as a sister with the Emperor, visited him constantly when a prisoner at Ham, but ceased to see him after the *coup d'état*, till at his urgent request a reconciliation was effected in 1863. He is described as imaginative, superstitious, obstinate, indolent, without moral sense; otherwise affectionate and amiable. The evidence is such as the friends of a common murderer often bring forward in the hope, sometimes realized, of proving enough insanity to extenuate the crime. The paper is, of course, extremely interesting. There is a full account of the escape from Ham; and the experience of the *parvenu's* son born in the purple is amusingly indicated in the Prince Imperial's comment on Mme. R.'s first visit: "Cette dame doit avoir été très grande amie de papa, ou elle ne m'aurait pas embrassé."

In the *Fortnightly Review* there is a poem of Mr. Swinburne's, "North and South," melodious as always, and this time with no harsher elements jarring with the memory of white flowers and sunlit skies.—"The Scientific Character of Spinoza's Philosophy" is vindicated by Mr. Frederick Pollock, who shows with considerable ability that even where it was impossible that Spinoza should have actually forestalled the latest results of modern discovery, he yet, with a justness of instinct that cannot be altogether accidental, almost always steers clear of direct contradiction, and often leaves a blank space exactly adapted to the reception of the new truth. The writer gives some illustrations of the way in which Spinoza's ideas may be rendered in equivalent modern scientific phraseology, and notices amongst other points the superior moderation of his fundamental demonstration as compared with the Cartesian formula: instead of "I think, therefore I am," Spinoza only reasons "If anything exists, something exists; I exist, therefore something exists."—An account of the Portuguese poets Miranda and Ferreira is illustrated with some literal translations.—Mr. Lang writes on "Mythology and Fairy Tales;" he appears to regard the *Mährchen* as the most ancient expression of a belief in particular fetiches; but this hypothesis seems hardly by itself to account for their wide dispersion without the help of the supposition, to which he only alludes in passing, that "there are necessary forms of the imagination which in widely separated peoples must produce identical results."

We have received the April number of *The Penn Monthly*, a Philadelphia journal "devoted to literature, science, art, and politics." The literary matter is conscientiously done, but has an *amateur* look; the question "What shall Philadelphia do for its paupers?" bears a lamentable likeness in its urgency and difficulty to the same question asked in London or Liverpool.

The latest literary novelty *Im neuen Reich*, or at least in Berlin, is a book edited by Berthold Auerbach and called *Die Erlebnisse einer Munnesseele*—one of those publications that excite a lively, but not very lasting, interest in intellectual drawing-rooms, strongly tinged with curiosity respecting the anonymous author and the extent to which his *Erlebnisse* are historical.

A German paper states that Mr. Bayard Taylor is going to follow up his translation of *Faust* with a "History of the Germans," for which it is said he has the (indispensable) qualification of a slight infusion of German (Suabian) blood, introduced only eight generations ago into his English pedigree.

## Art and Archaeology.

**South Kensington Museum.** A descriptive catalogue of the maiolica and enamelled earthenware of Italy, the Hispano-Moresco, Persian, Damascus, and Rhodian wares forming that section of the Museum, with historical notices, marks, and monograms. By C. Drury E. Fortnum, F.S.A. London. 1872.

MR. DRURY FORTNUM'S catalogue of the collection of Italian pottery in the South Kensington Museum has just appeared, the first of a series on the works of the potter.

Coeval with the most palmy days of Italian art, under the patronage of the Medici, Este, della Rovere, and other great houses of Italy, its subjects taken from the designs of Raffaele and all the first artists of the period, the enamelled pottery of Italy is one of the most remarkable productions of the Renaissance. Prized and cared for "as if so many jewels," it was sent as presents to princes and potentates, and its equivalent in gold offered for it in exchange.

The collection of South Kensington is, says Mr. Fortnum, "one of the richest and most extensive that has ever been brought together, and is particularly valuable from the number of signed or dated pieces which typify and confirm the existence of artistic potteries in various parts of Italy. The Hispano-Moresque wares, those glittering dishes made by the Moorish potters and their descendants in Spain, are also well represented, and the collection of Persian and Syrian fayence, though wanting in some varieties, is rich."

The catalogue is preceded by an introductory chapter, in which Mr. Fortnum gives a classification of the different glazed, soft wares, and after taking in review the vitreous pottery of the East and the stanniferous Hispano-Moresque wares, concludes with an historic sketch of the rise, progress, and decline of the enamelled products of Italy, known under the general name of majolica.

Glazed pottery is divided, according to the nature of its glaze, into glass glazed, lead glazed, and tin glazed or enamelled.

The glass glazed includes the Persian, Damascus, and Rhodian wares. Brought to its greatest perfection in Egypt, tiles and bricks of similar vitreous glaze were made by the Babylonians and Assyrians, in Persia and Arabia. According to Ctesias the walls of the palace at Babylon were covered with coloured representations of the battles and hunting expeditions of Semiramis, and tiles with figures and designs for wall decoration occur in the palace of Ninroud. The walls of the palace of Ecbatana were, as we learn from Herodotus, decorated with seven colours—a statement confirmed by recent discoveries there, and by that of a wall faced with glazed bricks with figure representations found at Khorsabad. The tomb of Mahomet and the mosque at Medina are also adorned with glass glazed tiles—so early applied and so widely spread was this vitreous glaze, the parent of those wares known under the name of Persian, Damascus, and Rhodian.

Little recorded history has descended to us on the subject of Italian enamelled pottery; our chief sources of information are the works of Piccolpasso and Passeri.

Piccolpasso was a professor of medicine, artist, and proprietor of a "botega" or ceramic workshop at Castel Durante. He finished, in 1550, an important manuscript, now in the library at South Kensington, in which he gives a detailed account of the various processes by which these beautiful works of the potter's art were produced: how the clay brought down by the mountain torrents was gathered up from the beds, mellowed, and prepared for use; how the different pieces were formed, the various styles of decoration, recipes for the pigments employed, and the manner of painting and applying the metallic lustres. Valuable as is this work (of which Mr. Fortnum gives an abstract) as regards the details of manufacture, Piccolpasso gives no history of the rise and development of the different fabrics.

This part of the subject is more extensively treated in the work of the Abbate Passeri, published in 1758, in which he gives various details concerning the progress of the manufactures and of the artistic works they produced; but his statements require to be received with a certain amount of reservation, as after the lapse of two centuries all traditions of the art and its products must have been well nigh lost.

What other information we possess on the subject is derived from the works themselves, and by a careful comparison of the different specimens with each other and a close study of their characteristics and their merits, we have, step by step, by a regular process of induction, arrived at great results, and have ascertained the names and products of many manufactures of which the very existence was unknown.

Next to the vitreous are the lead glazed wares, those most in common use in Northern and Western Europe—the only glaze known there until the discovery of the tin enamel.

But the lead glaze was transparent and showed the dark colour of the paste underneath. In order therefore to obviate this difficulty and to produce a white surface fitted for painting, an intervening process was adopted. A fine white earth was ground, purified, and reduced to the consistency of cream—"slip" in modern parlance, the "engobe" of the French potter. Into this the piece was dipped and slightly baked to fit it to receive the decorations, after which it was covered with the lead glaze "marzacotto," variously coloured yellow, green, blue, or black, applied wet, after which process the piece was again fired. To the lead glazed class belong the earliest wares of Italy, *mezza majolica*, painted and *graffito*.

*Graffito*, one of the rudest forms of ornamentation, consisted in scratching the pattern with an iron tool through the white engobe or upper layer, thus showing the design in low cameo on the red clay beneath. It was then covered with the glaze splashed or spotted with colour. We find the same style of decoration in the French pottery of the Middle Ages, and it has been lately successfully reproduced by Minton. The term "*graffito*" is applied to the object so ornamented.

Of *mezza majolica* are the "*bacili*," so correctly described by Passeri, large, clumsy dishes of flesh-coloured clay with a circular "*giretto*" behind, invariably pierced with two holes for the purpose of hanging them against the wall, the outlines of the archaic figures traced in blue, the flesh white. A scaled or chequered border generally surrounds a portrait bust in profile. These dishes were made during more than a century, as is evident from the persons whose portraits or arms they bear. The great characteristic of these dishes is their admirable "*madreperla*" lustre, for ever changing as the light is reflected from their brilliant surface. Passeri claims these productions for Pesaro, in which he is borne out by many of the portrait busts being those of the Sforza princes, lords of Pesaro and great patrons of *mezza majolica*. The lusted pigments were certainly introduced from Pesaro to Gubbio, where, under Maestro Giorgio, they attained an excellence unsurpassed. The application of them seems to have been confined to these Urbino cities and to Diruta, in the Papal States. Of whom did the Italians learn the art? The metallic decoration was used in Persia and Arabia upon the glass glazed pottery previous to its application to tin glazed wares by the Eastern potters of the Balearic Islands, Spain, and Sicily, and that it was used in Italy before the introduction of the tin enamel, we have abundant proof in the lead glazed *mezza majolica*. Some suggest that Pesaro, being situated on the Adriatic, may have learned the art from Persian or other oriental emigrants fleeing from persecution in their native country, while others suggest that the Moorish potters of Majorca or Spain conveyed the knowledge to Italy—an assumption borne out by the term *majolica* being in the first place confined to the lusted tin enamelled wares. Modern writers propose to restrict it to its original acceptance. It is also a curious fact that nearly all the specimens of Hispano-Moresque ware which adorn our cabinets and enrich our museums have been procured from Italy, showing the estimation it was held in in that country.

There is no record of Italian pottery coated with tin glaze before the time of Luca della Robbia, who, simultaneously with his enamelled terra cotta sculpture, painted on the same vehicle or upon flat surfaces. Of this the series of medallions representing the twelve months, now in the South Kensington Museum and supposed to have been painted by him as part of the decoration for the study of Piero de' Medici, is sufficient evidence.

Earliest in the use of the tin glaze, earlier probably than Faenza, is the fabrique of Caffaggiolo, near Florence, its existence only known by its works. Here, among the romantic scenes of the Apennines, was a villa of the Medici, the favourite residence of the great Cosmo, who assigned for the preference he gave it the singular reason that all the country he could see from his windows was his own—he "was monarch of all he surveyed." It was also the chosen retreat of Lorenzo, and where his sons Giovanni, the future pope, and Giuliano passed much of their boyhood. Here, under the fostering care of the Medici family, arose a manufacture which seems to have been the centre of ceramic art in Tuscany. Mr. Fortnum says:—

"It was but a few years since that the ill indited name of this 'bottega,' noticed upon the back of a plate, was read as that of the artist who had painted it until the discovery of others more legibly written proved that at this spot important and highly artistic works had been produced. The occurrence of a monogram upon several, and the comparison of their technical details, have led to the recognition of many others, and revealed the fact that this fabrique had existed from a very early period."

It has left no record of its artists. The characteristics of this ware are its deep masses of intense cobalt blue, brilliant as lapis lazuli, often forming the background of the picture; a liquid copper green, and an opaque, bright Indian red—a colour exclusively confined to this fabrique and Faenza. The pieces are covered with a rich, even glaze of the purest white.

The museum is rich in specimens of various dates, some of extraordinary beauty. Among the many may be instanced the celebrated Bernal plate, representing a majolica painter in his studio painting a piece in the presence of two personages of distinction, incorrectly described to be that of Raffaele and the Fornarina, the figures in clear relief on the dark blue background. A St. George, after the well-known masterpiece of Donatello, and a large circular plateau or dish, the subject Pope Leo X. in a procession borne upon men's shoulders, the composition consisting of fifty figures—one of those gigantic dishes called "*piatti da pompa*," made not for use but for display, to be placed with vases of rich form on the "*dressoir*" or high-backed sideboard.

The "*palle*" and other insignia of the Medici are painted on many of the Caffaggiolo pieces, and the family motto "*Semper*," first taken by Lorenzo the Magnificent and continued by his sons and also by his nephew, Pope Clement VII. Another more mysterious motto is of frequent occurrence, the word "*Glovis*;" it was the *impresa* of Giuliano, Lorenzo's third son. Read backwards it makes "*Si volge*" ("it—that is Fortune—turns"), Giuliano meaning to imply that fortune, which had hitherto frowned upon him, was now turning in his favour. Giuliano assumed the device upon being appointed gonfalonier of the Church. It is to be seen on a fine pitcher in the South Kensington Museum, and so often occurs as almost to lead one to infer that he was intimately associated with the Caffaggiolo works.

M. Jacquemart surmises that Luca della Robbia learnt the nature of the tin enamel at Caffaggiolo—it is more probable that he taught it there, for that fabrique adopted it at a very early period, and there is no piece of *mezza majolica* known to have been produced at Caffaggiolo.

The products of Siena have a close affinity to those of Caffaggiolo, and probably the art at Siena emanated from the grand ducal fabrique. The works of Maestro Benedetto are worthy to be ranked among the finest productions of the sixteenth century. A plate by him with grotesque border and the figure of St. Jerome in the desert may be considered the type of the master and is one of the gems in the South Kensington collection.

The introduction of the tin enamel and the superiority of its opaque white as a ground for painting seem to have stimulated the development of artistic pottery throughout Italy, but in order to study to any advantage the various ceramic establishments and their artists they should be distributed in geographical groups.

To begin with those of Romagna or the Marshes, Faenza has been ever held to be of the highest antiquity—an antiquity, however, which it shares with Caffaggiolo and the Umbrian cities of Pesaro and Castel Durante. There is little doubt but that it gives us the term "faïence," though claims have been set forth in favour of an obscure town near Fréjus. The productions of the Casa Pirotta, dating from 1490, are of the highest order as regards decoration and artistic painting; the wide borders of grotesques painted in a pale blue and white on a dark blue ground, "sopra azzurro," and the red pigment called "rosso di Faenza," which is also to be seen on the Tuscan ware, are characteristic of this "botega," the distinguishing mark of which is a crossed circle, with a pellet in one division. Nearly about the same time Baltasara Manara, another artist, became celebrated, but few fine examples by him have descended to us; the seventeen pieces in the Correr Museum at Venice, part of a beautiful service or "credenza," are moreover ascribed to Faenza.

The pure and delicate style of its "istoriato" pieces and the elegance of those decorated with arabesques caused the Faentine majoliche to be much sought after. Duke Alfonso of Ferrara ordered a set of pharmacy vases for his spezieria; the cardinals sent in embassy carried it to Rome and France, and Henry III. was so charmed with the beauty of this pottery that we find him, in 1580, giving large orders, which he desires to be executed with the "vitesse des enchantements."

One ornamental style in which this fabrique specially excelled was the composition of low cups or dishes on feet, impressed or moulded generally in gadroons, and rivalling metal work in elegance. They were called "scannellato" and "smartellato." Pieces were often decorated in compartments, called "a quartiere," of varied grounds, cobalt, yellow, orange, or dark blue, with white grotesques and a central medallion. These harlequin plates seem to have been in great request, and were copied at other fabriques.

The "coppe amatorie" were a gallant invention of the age—small plates with a deep cavity in the centre, and broad brims decorated with musical instruments, written music, or grotesques. Young people at balls offered these to their partners filled with sugar-plums or preserved fruits, and when the lady had emptied the cavity of its "confetti" she generally found depicted at the bottom an "amorino" or some equally eloquent emblem, which no doubt the offering had led her to anticipate. The backs of the Faenza plates are usually decorated with concentric circles, scroll work, or other devices.

Forlì, Rimini, and Ravenna, with some smaller places, complete the Romagnan group. In that comprised in the recent States of the Church, the most important is Diruta, a dependency of Perugia. It was only a few years since that this fabrique was made known by its signature. The subjects are painted in blue outline, and are lustred with a brassy-gold colour, evidently copied from or derived from the

"bacili" of Pesaro and Gubbio; but the use of the metallic lustre at Diruta was not so exclusive nor applied upon wares of such high class as in the Umbrian fabriques.

It was in the hill cities of the duchy of Urbino, under the patronage of its della Rovere dukes, that the art flourished to its greatest extent at its four great centres, Pesaro, Gubbio, Castel Durante, and Urbino. The enamelled glaze, "majolica fina," as he terms it, was, according to Passeri, introduced in 1500 into Pesaro. The mezza majolica of this fabrique has been already referred to, but its brilliant metallic lustres, reflex of Moorish taste, appear to have rapidly declined in favour at Pesaro as they became developed at Gubbio, and from the accession of Duke Guidobaldo II., in 1538, the "istoriato" taste came in, and painted works of the greatest perfection were executed in the Lanfranchi botega at Pesaro, inspired by the designs of Timoteo della Vite and other artists of the Umbrian school. It was in favour of Giacomo Lanfranco, who had discovered the secret of applying pure gold upon his wares, that Duke Guidobaldo issued an edict in 1567. No authenticated piece by him has descended to us, the only known gilded majolica being that of Castelli, unless a cup in the South Kensington Museum can be assigned to his fabrique. It is decorated with Cupids upon a pale grey ground, and enriched with real gold burnt in upon the glaze.

Gubbio retained its speciality for the metallic lustres, but its fame is almost entirely associated with the name of Maestro Giorgio, a gentleman of Pavia, who having received in his own country the honours due to him as a statuary and ceramic artist, emigrated to Gubbio. His botega was the great centre of this style of embellishment—indeed he would almost appear to have had the monopoly of its use, and to have applied his lustred pigments to the works of the artists of Urbino and Castel Durante, though M. Jacquemart is very indignant at the idea of so humiliating an occupation. Nevertheless there is every presumption that such was the case, and that either Maestro Giorgio or his son Cencio applied their ruby, golden, and opalescent tints as required. The secret of these pigments and the mode of using them was strictly guarded, but from Piccolpasso's account it would appear that the pieces are fired in an open furnace exposed to the direct action of the flames. The pigments consisting partly of metallic salts, after some time being exposed to a simple heat, have then directed upon their glowing surface the heated smoke given off by faggots of broom thrown upon the fire; this smoke, being in fact carbon in a finely divided state, has great power at a high temperature, reducing the metals from their salts and thereby decomposing them, leaving a thin coat of mixed metal, varying in colour and iridescence from admixture with the glazes, and producing the beautiful effects so well known.

The Museum series of the works of Maestro Giorgio is very complete, ranging from 1501 to 1532; his choicest productions are dated 1525; many equal in quality, both as regards drawing, colouring, perfection of enamel, glaze, and lustre, his most celebrated works, such as "The Stream of Life," "The Three Graces," and "The Judgment of Paris" of Mr. Fountaine, and the splendid dish, perhaps the finest example which has come down to us, lately acquired by Sir Richard Wallace from the Parpart collection, the subject Diana and Actæon, surrounded by a rich grotesque border of dragons, serpents, masks, and trophies. There is a good figure of it in M. Delange's splendid work. The borders of this earlier period differ greatly from the later Urbino arabesques, and are generally grounded in dark blue or yellow, and executed with great delicacy of touch and power of colouring. In 1560-70 the use of the lustred pigments was abandoned.

Castel Durante was early the seat of ceramic industry, and not only produced fine wares at home, but furnished potters and painters to the greater part of the workshops of Italy, and sent ceramic colonies to foreign countries. The Pellipario or Fontana family went thence to Urbino, others to Venice, Florence, Ferrara, and Rome, to Flanders, France, and Corfu. Batista Franco designed for her artists, and Duke Francesco Maria made Castel Durante the ducal residence. Its wares are characterized by the richness and purity of their glaze; subject pieces do not seem to have been so abundantly painted there as in some other manufactures, but grotesques, generally arranged in the style called "a candellieri," are the favourite mode of decoration, and the oak foliage elegantly interlaced "a cerquato" was frequently used as decoration in compliment to the della Rovere family.

The residence of Duke Guidobaldo II. at Urbino drew more favour to the potteries of that city, which produced some of the finest specimens of the great national manufacture. At the same time it must be remembered that Urbino claimed more than she actually made, the name being that of the duchy the appellation of "Urbino faïence" was indiscriminately applied to vases made at Castel Durante, Pesaro, and Gubbio.

Most important among its artists were the Fontana: their bottega, created by the enterprise and sustained by the industry of one family alone, produced the choicest specimens of the Urbino furnaces, magnificent vases of unsurpassed beauty, cisterns of large size richly "istoriati" with subjects from sacred, profane, and classic story, admirably modelled and of rich glaze, masterly execution, and bold colouring. Duke Guidobaldo, a great patron of the Fontana family, sent services "credenze" to the Emperor Charles V. and to Philip II. of Spain, for which Raffaele dal Colle and Batista Franco furnished the designs. These, as well as the famed Spezeria vases, were executed in the bottega of Orazio Fontana, who, says Passeri, had no equal in the execution of his paintings and the distribution of his colours.

At Urbino also worked Francesco Xanto, who appears to have passed twelve years in the service of Dukes Francesco Maria and Guidobaldo II. At the summit of his artistic career and at the period when the taste for metallic lustres was at its height, he yielded to the general fashion and sent his pieces to Gubbio, where they were profusely lusted with its iridescent colours. Xanto may be considered to represent the "majoliche istoriate" of the period. He borrowed largely from Raffaele figures and groups which he applied most happily to the subjects he had to represent.

The so-called Urbino arabesques are of great celebrity, subjects painted in medallions, surrounded by beautiful grotesques on an enamelled ground of the most brilliant white. In 1560 the art was at its height at Urbino.

"But," says Mr. Fortnum, "excellent and highly decorated as are the finer products of this period from the furnaces of the Fontana of Urbino and of the Lanfranchi of Pesaro, to the true connoisseur, they want the sentiment and expressive drawing, the exquisite finish and delicacy, the rich colour and the admirable design of the earlier works produced at the Casa Pirotta, at Florence, Forlì, Castel Durante, Siena, and Caffaggiolo in the latter years of the fifteenth and the first quarter of the sixteenth centuries (1480-1520), and by Maestro Giorgio at Gubbio, many of which rival in beauty the exquisite miniature illuminations of that palmy period of Italian art."

In 1574 Duke Guidobaldo died, Batista Franco and Orazio Fontana having preceded him, and the art rapidly declined. His successor, Duke Francesco Maria II., abdi-

cated in favour of the Holy See, and the rich collections of the duchy passed to Ferdinand de' Medici, who had married his granddaughter Vittoria, and were removed to Florence; and the Urbino artists passed into other localities.

We do not enter into the history of the northern duchies, the Piedmontese and Lombard cities, the potteries of Venice, Naples, and the Abruzzi: all produced wares of some excellence, but wanting in the delicacy and richness of the earlier works and in that vigorous and powerful colouring so strikingly apparent in the productions of the furnaces of the Urbino duchy and the circumjacent districts of Romagna.

Mr. Drury Fortnum's catalogue raisonné is most conscientiously executed and the result of serious investigation. He has made a most patient and careful study of the various pieces before arriving at the conclusion he deduces of the various manufactures to which to assign them. On many of the fabriques themselves and on the works of their artists he has thrown much new light and settled many vexed questions, entering of course more fully on his special subject than the more general histories of ceramic art of Mr. Marryat and M. Jacquemart would admit of. There is yet much to be learned as ancient documents are from time to time brought to light, but the present volume contains all that is now known and more than has hitherto been published on the history of enamelled earthenware in Italy.

F. BURY PALLISER.

## PUBLIC WORKS AND ANTIQUITIES IN ROME. II.

DURING many months the works on the Palatine have been suspended, owing (it is stated) to the outlay requisite for other contemporary undertakings, particularly those on the Forum and in the *Thermæ* of Antoninus. This is to be regretted, for the Palatine *scavi* had led to the discovery of a most important group of ruins, long buried and completely forgotten, on the western ridge of that hill. From the difficulty of identifying these remains with any known edifices of the Kings or of their period, one may conclude (or at least conjecture) that we see here before us such proof as can be afforded by monumental testimony of the existence of a Rome anterior to Romulus—of a small but strongly fortified city, with temples and public buildings, occupying the higher ground where this hill overlooks the valley of the Circus Maximus. The ruins on the highest platform of the ridge appear to belong to a temple with cella and atrium of narrow dimensions, though surrounded and divided by walls of immense thickness, now reduced to the height of two to three feet, in some places much lower; the material being granular tufa regularly hewn and laid in courses, apparently without cement. Lower down, westward, are other ruins in similar hewn blocks of friable and yellowish lithoid tufa, probably from the quarries of this hill; and one side of these singular ruins overlooks a narrow court, bounded at the west by the remnants of an arcade in similar ponderous stonework, the arches still in great part buried under ground. Some of the Roman archæologists suppose this to be the substruction of the oft-renewed cottage, so venerated by the ancient Romans as that of Romulus, or of his foster-father Faustus. Problematical as is the origin of these venerable buildings, the internal evidence of high antiquity is conveyed in their massive construction. One feels a certain awe while contemplating such "ruins of a world gone by," now become mysterious and almost unintelligible, but telling us, as apparent to archæologic speculation, of a primeval city that reminds of Evander and Æneas, heightening our interest in the Virgilian Epic, which idealizes to immortalize the primeval legend. In the course of the works on this spot have been dug up numerous fragments of terracotta, like those abundantly supplied in the tombs of southern Etruria. Below these Palatine ruins is another remarkable detail, no doubt connected with them, and brought to light about the same time: a very steep ascent up this ridge of the hill passing through walls, now reduced low by decay, but still of stupendous strength and thickness. Here we may (with Roman antiquarians) recognise what Plutarch calls the "stair-

case of the beautiful shore," and also the "descent from the Palatine to the Circus Maximus." Some of the *siglæ* found in the other walls, on the higher grounds, resemble the ancient Italic characters.

The other Palatine ruins, where recent works have led to noticeable results, are those on the south-western side belonging to the additions made, and described as most splendid, by Domitian; partly also to the latest amplification of the palatial buildings due to Septimius Severus, after whom no other emperor added any important structures to the imperial residence on this hill. Most conspicuous is the part recognisable as the *Stadium Palatinum*, mentioned by few ancient writers, but certainly founded by Domitian, and restored, or enlarged and embellished by Severus. Suetonius mentions the constructing by Domitian of a place for such games, races, spectacles, &c., as were usual in the Roman stadium, but without particularizing the site of that edifice on the Palatine. According to Church-legend this area was the scene of the martyrdom of S. Sebastian. It probably divided the palace of Augustus from the buildings of the two later emperors. Works were commenced here by the Papal Government several years ago. Resumed under the new authorities, they have been carried out, with the more interesting results, under Signor Rosa's direction in 1871. A great hemicycle, or exedra, was in that year completely disencumbered of the soil which had concealed the whole lower part, as well as the remnants of a magnificent colonnade with marble and granite shafts extending in front. A valley, partly natural, but to a great degree artificial, is now laid open, running from east to west; this area for the stadium being of measurement exactly corresponding to the prescribed length for such places of entertainment, namely 625 feet. At the western extremity it is bounded by a hemicycle of walls, still lofty though much decayed; and below these, in the hollow alike describing a curve, are the remains of what seems to be a decorated fountain. The great exedra is in two storeys, the ground-floor consisting of three spacious halls, in which are remains of paintings manifestly of the period of the Roman decadence, though not without grace in design; one singular object among the details here seen being a globe fixed in a frame, perhaps intended for the celestial sphere—such as we know were used in the ancient schools of astronomy—if for the *terrestrial*, affording proof that the ancients were acquainted with the sphericity of our earth. All that is left of architectonic decoration in many-hued marbles, rich incrustations, shafts of granite and Carystian marble, and other relics of an overthrown portico with colonnades, among these ruins, gives the idea of splendour and wealth of material the most profuse.

The works on the Forum are actively prosecuted, and do not fail to be rewarded by the exhaustless wealth of antiquities from time to time appearing below the dust of ages on this chief historic theatre of Rome—the great centre of actions, memories, traditions, from the poetic legend of the vision of Castor and Pollux, after the battle on the Regillus lake, to the great and holy S. Gregory, and his contemporary the infamous Phocas, autocrat of the Eastern Empire. Since the spring of the past year most memorable discoveries have been made here. The whole of this classical area has been laid open to its ancient level from the column of that Greek Emperor, at the north-east, to a line almost parallel with the temple of Antoninus and Faustina at the south-east angle. A broad channel of the Cloaca Maxima, lined with immense blocks of lithoid tufa, was uncovered below the pavement at the southern extremity of the Julian Basilica; and presently were found a great many remnants of statues, some superior, some very inferior in style, besides many curious epigraphs and dedications on basements, among the *débris* of that great edifice, built by Augustus on the site (as supposed) of the earlier Sempsonian Basilica, that, namely, founded by Tiberius Semppronius Gracchus, father of the celebrated tribunes Tiberius and Caius. Among the more valuable epigraphs is one in honour of Augustus, here styled *Princeps Juventutis*, on a tablet erected by the *Senatus Populusque* in the year of the city 754. A profusion of marble fragments, sculpture, and architecture lay strewn around the temple of the Dioscuri, now extant only in three beautiful Corinthian columns on a lofty stylobate, and a remnant of the cella with some of its mosaic pavement. Among the fragmentary sculptures found in this vicinity, and serving to attest the splendour of that temple as restored by Domitian, are

to be distinguished a portion of a colossal statue resembling the Farnese Hercules, an archaic relief of Hygeia and Minerva, and a bust of the Emperor Constantine. Among the epigraphs strewn over the same surface, is one variously commented on, inscribed in small archaic letters on a broken cornice with the name of Romulus, here twice designated as "*filius Martis*." Distant from that temple of the Dioscuri only a few yards, and divided from its front by the ancient road on the east side, rises a ruin-heap, now like an irregular and much furrowed mound of earth, supported on two sides by massive buttress-walls, the whole standing on a platform paved with travertine, and ascended by a few ruinous steps from the surrounding level.

Here we see one of the most important of historic monuments yet discovered, after long interment under accumulated soil, that "*Edes Cæsaris*" raised on the spot where the great Dictator's body was burnt, and dedicated by Augustus, B.C. 28. The origin of these now formless ruins, utterly despoiled of their marble adornments and of all architectonic details, is further attested by the curved platform of stonework communicating with an elevated space in front, below where stood the peristyle, the now lost colonnade of which is known to have been Ionic, with only four pillars forming the façade of the cella. In that semi-circular platform we recognise the "*Rostra Julia*," placed here by Augustus, and from which thenceforth were pronounced the funeral orations of all those emperors, buried or burnt on the pyre in Rome, to whom such posthumous honours were not refused. We now see three distinctly recognisable Rostra on the Forum: this last discovered; another, alike a curved platform, and still lined with rich marbles, close to the Arch of Septimius Severus (probably a restoration by that emperor, or of about his period), and the other more ancient Rostra at the base of the Capitoline Hill, being more in advance of the Severus Arch towards the Forum, identical with the tribune of Republican times, which we know was removed by Julius Cæsar, for some political motive, from its former place in (or beside) the Comitium to a spot nearer the centre of the Forum. These, the oldest and most historic Rostra, present the form of a long rectilinear structure in massive and regularly laid blocks of lithoid tufa; and as its remains stand before us, we can identify them with the Rostra introduced in one of the small, feebly executed reliefs on the Arch of Constantine—the subject, that emperor addressing the people from this tribune amidst the festivities on occasion of his triumph over Maxentius. Along the road, with ancient pavement, passing through the centre of the Forum from north to south, stand seven ponderous brick structures, all of the same quadrangular form, and parallel with the elevated basement of the Phocas Column. It is evident that these must have been utilized, probably for dwellings, in the Middle Ages, as they are hollowed out, the inner mass of masonry being removed; and we may suppose they served originally for the support of memorial columns or colossal statues, so many of which were erected on this area even before the imperial period. Farther westward is another much lower basement of brick, lined with travertine, and evidently for a colossal statue—a most valuable discovery, for here we may recognise the place of the equestrian effigy of Domitian, so described by the courtly Statius (*Silvæ*, l. i., Carm. i.), that the sites of all the more conspicuous buildings adjacent to, and overlooking it, may be determined. We have thus a key in monumental form to almost the entire topography of Rome's Forum. Two other mediæval buildings, one a ponderous brick tower, the other a more considerable mansion or castle, have been exhumed at the northern and southern sides of this area; and both being unsightly incumbrances, one (the tower) has been since demolished, the other (the castle) for the greater part, though not entirely, swept away. Beneath that tower were found, weighed down and concealed, the most precious works of art yet yielded at any time by the Forum: two large marble panels with finely treated bas-reliefs, historic groups on one side, and on the other side, in each instance, the three animals, a bull, a ram, and a boar, victims at the Suovetaurilia sacrifice offered at each celebration of the general census, and also at certain other solemnities. The subjects of the historic reliefs, each with numerous figures, have been variously conjectured. I believe that the most plausible, indeed quite satisfactory, explanation is that advanced by Professor Henzen: namely, that both illustrate the public beneficence of Trajan, and are works of that emperor's time—the one, his edict, enthusiastically extolled, ordering provision from

the State treasury for all indigent children as well in Rome as in all the Italian municipia; the other, his remitting of all debts retrospectively due to the State, and the public act by which this clemency was declared, the burning of the tablets, on which such debts were registered, before the Emperor's eyes and on the Forum. That cremation is the intelligible subject of the relief in question. Of the Emperor's figure remains nothing but parts of one leg, and of the chair where he is seated on the Rostrum. Mutilation has done most deplorable havoc with both the historic reliefs here before us, almost all the heads and hands being broken off, and as it seems through deliberate malice, though the three animals, decorated for sacrifice with fillets and garlands, are perfectly preserved on both these marbles. Another interesting feature in the historic scenes so well illustrated is the background of architecture to each group, enabling us to recognise at once the Forum Romanum and the principal temples on the Capitoline declivity; also the now lost Arch of Tiberius, here placed between the temples of Concordia and Saturn, though its actual site, we know, was lower down at the foot of that hill. A long front of arcades with pilasters, in each background, is probably intended for a lateral view of the Julian Basilica.

C. I. HEMANS.

### NOTES ON ART.

The Berlin museums will probably soon acquire an importance proportioned to the station which Prussia is acquiring in Europe. When the gallery of painting which Schnikel planned and built at Berlin is enlarged there will no doubt be room for the exhibition of a number of canvasses now lying unheeded and unknown to the general public in the royal residences; and also for the display of new purchases that have been made in Italy and elsewhere. There are few countries so rich in examples of the French art of the seventeenth century as Prussia. The letters K. S. (Königliche Schlösser) in the catalogue of the Berlin Museum indicate the origin of many pieces which have already found their way out of the residences of the Hohenzollern into the national collection. We find under this head some delicate pieces by Mignard and Rigaud, religious compositions by Subleynas and Le Sueur, allegories by Poussin and Lairese, and powdered gallantries by Watteau and Lancret; but the number of works of these masters now on the walls of the Berlin gallery is as nothing to those still remaining in the various palaces once inhabited by kings and princes of the Prussian royal house, and it would make a French connoisseur's mouth water to find what treasures of Watteau and Lancret are concealed in mouldy apartments seldom visited by the royalties of our day. These treasures should be brought into the national gallery, if only for the sake of preservation. It would be easy to find a form of transfer which should preserve the ownership in the hands of the dynasty if it chose to keep a lien upon the property of the crown so as to distinguish it from the property of the nation. It ought not to be a matter of indifference to the Prussians any more than to lovers of art in general that masterpieces should be buried in country houses and subject to all the dangers of neglect. It is desirable on all accounts that these masterpieces should be collected, cared for, and displayed.

The funds at the disposal of the Prussian museums are small. Even now that Prussia is rich the sum placed at the disposal of the director, Count Usedom, is not more than £16,000 a year, and with this he is bound to keep up the galleries of painting, sculpture, casts, antiques, coins, engravings, ethnography, Egyptian antiquities, &c., &c., but even with these means much may be done. Something indeed has already been done creditable to the nation, though not perhaps of a kind to captivate the general public. Thus we hear that one of the fine Nicolas Poussins of the Sciarra collection at Rome has been transferred to Berlin. Some clever and characteristic landscapes of Andrea Schiavone, a fine portrait assigned to Moroni and Titian have been bought, and a Virgin and Child by an Italian realist of the fifteenth century; a picture of considerable force and depth as the work of a tempera painter will be exhibited. Lastly, the large and characteristic work of Signorelli, the "School of Pan," will attract the eye of the public. Signorelli was not an elegant painter; he cared little to delineate the delicate charms of female beauty which had such attractions for the Venetians

of the sixteenth century. Still less was he a colourist. His "School of Pan" is not distinguished from other works of the same master by more select form or greater brilliancy of tone; but it is characteristic because of the purity with which the shape of limbs and extremities in nude figures is rendered, the skill with which movement is rendered, and the boldness with which the surfaces are treated. In other departments the directors of the Berlin Museum have also shown activity. They have purchased a very remarkable Niello by Finiguerra, and some antiques and coins. They propose to complete a collection of photographs from prints, pictures, and works of a plastic and architectural character. In emulation of the scheme proposed by M. Thiers they hope to furnish their museum also with a collection of copies, and to increase the collection of casts especially with models discovered or discoverable in the classic territory of Greece.

Judging from a letter from an art-correspondent in Venice that appears in the *Beiblatt zur Zeitschrift für bildende Kunst*, the Venetian painters of the present day must at last have reached the bottom of the abyss of incapacity towards which they have been tending ever since Venetian painting fell from its glorious estate. "Painting," said a Venetian connoisseur the other day, "has become like medicine with us—a receipt—a mere receipt," and unfortunately it is not the right receipt. A permanent exhibition of the works of modern Venetian art is held in the Palazzo Mocenigo, where the visitor to Venice after he has studied the art of the fifteenth and sixteenth centuries may if he likes note what the nineteenth has brought forth. A few young Venetian painters, most of whom however have learnt in foreign schools, do not deserve to be ranked with the effete painters criticised in the *Beiblatt*. We presume they do not send their works to the permanent exhibition of impotence held in the Palazzo Mocenigo.

It is a source of real satisfaction to be able to announce that Mr. Castellani's antiquities, of which some account was given in our last number, have been purchased, and that they are now exhibited to the public in the Second Vase Room of the British Museum, with the exception of the bronze head, the terracotta sarcophagus, and the marble head of Hera, which for a better light are placed the first in the Bronze Room and the other two in the sculpture galleries.

Benjamin Vautier, a painter of the Düsseldorf school, has just finished a much admired picture whose subject reminds us of Faed. It represents a young countryman sitting by the sick-bed of his wife with his little baby daughter asleep in his arms.

In the *Zeitschrift für bildende Kunst* the editor, Dr. Lützw, reviews the "Frans Hals Gallerie," a series of etchings that is now in process of publication. We have alluded to this work before. The etchings are by W. Unger, who is already well known from his clever reproductions of the pictures of several of the minor galleries of Germany. Unger has a thoroughly congenial subject in the works of Frans Hals. He does not adequately represent the calm strength and depth of character in the great Italian portraits, and even Vandyck loses in his hands some of the Vandyck refinement; but the genial Hals suits him exactly, and the etchings from this master in his earlier series are nearly perfect in their fidelity. A little Dutch lady in state attire stands as frontispiece to Dr. Lützw's article. It is somewhat hard to decide whether she is old or young.

The current number of the *Gazette des Beaux-Arts* opens with the first part of a valuable article on Phœnician art by Ernest Renan. Unfortunately the most diligent research throws very little light on the art of the great maritime nation of the old world.—Henry Havard continues his notices of the paintings of the Dutch school exhibited in Amsterdam in 1872. His article is illustrated by a beautiful etching by Courty, after Peter de Hooghe.—Next comes an account of the Belvedere Gallery at Vienna, with critiques on some of the paintings. The author reduces the thirty-five pictures ascribed to Titian in the catalogue to about half that number.—Paul Mantz contributes the second part of his article on the Rotham collection. It is accompanied by several good illustrations, the best being an

etching after Lancret's picture, "La Dame au Parasol."—The following article by René Ménard is devoted to the Favre collection. A good part of it is occupied with a highly eulogistic critique on Delacroix's "Two Foscari." Etchings from an "Interior" by Dupré, the "Ophelia" of Delacroix, and a beautiful "Return of the Flock" by Troyon illustrate the article.

An antique glass vase has been disinterred in the neighbourhood of Arles. It consists of two parts, one of common glass, the other, which is superimposed on it, of red glass curiously knotted. It bears the inscription *Divus maximianus Augustus*.

The death is announced of Carlo Arienti, one of the best known painters of the modern Italian school. He was director of the Académie des Beaux-Arts at Bologna.

On the 21st of March Vilhelm Nikolaj Marstrand died at Copenhagen. Marstrand was the most original and powerful painter that Danish art has produced. Born in 1810, he studied first under Eckersberg, and later in Rome was a friend and associate of, though much younger than, Thorwaldsen. His greatest works are the colossal frescoes in Roeskilde Cathedral.

## Philosophy and Physical Science.

**History of German Philosophy.** [*Geschichte der deutschen Philosophie.* Von Dr. Edward Zeller.] München. 1872.

THIS volume by the well-known author of the *History of Greek Philosophy* is one of a series of popular histories of German science published by the Munich Academy of Sciences. It may be doubted whether the plan of the series is not a mistake, though it is a natural mistake at a time when the idea of nationality fills so large a space in the German mind. Science is not a national product, especially in modern times, and there is considerable disadvantage in taking the contributions of any nation out of their place in the general sequence of discovery. And it might be feared that this disadvantage would affect philosophy, the most universal of sciences, more than any other. But in the present case, owing to the peculiar relation of Germany to the history of philosophy, it is not so. The Germans took scarcely any part in the earlier movement of speculation till towards the end of the seventeenth century. When Leibnitz looked for a "Philosophus Teutonicus" before his own time the only writer he could find worthy the name was the mystic Boehme, who had indeed the deep insight of a philosopher into the speculative problems suggested by the moral and religious life, but who was utterly devoid of any conception of scientific form or method. The reasons of this almost complete absence of philosophical thought among the people that afterwards proved itself the most speculative among European nations are well stated by Dr. Zeller. The scholastic philosophy was pre-eminently the philosophy of Latin Christianity, a philosophy of compromise, that started with the recognition of an absolute spiritual

authority in the Church, and sought only by the aid of Aristotelian logic to give formal development and system to the doctrines received from that authority. It was a philosophy altogether opposed to the main tendencies of the German spirit, which sought in Christianity not so much a rule of life and opinion as a satisfaction for the reason, or at least for the heart and conscience, of the individual. It is in the revolt against scholastic philosophy and theology that German thought first begins to show its power. Already in the beginning of the fourteenth century the bold mysticism and pantheism of Eckhart gave rise to a movement of the religious life which continued, though in a softened and subdued form of pietism, to keep up a protest against the dominant orthodoxy and ceremonialism till it culminated in the Lutheran Reformation. And this religious movement was parallel with a kindred movement in science. Paracelsus, who gave the first powerful impulse to the study of physics, was a German, so also were Erasmus, Reuchlin, and others of the most eminent of the revivers of learning. Yet the promise of this brilliant dawn was not for a long time fulfilled; the Reformation drew all the most powerful intellects of Germany first into the religious contest with Rome, and then into the political contest with Austria that grew out of it. And amid the miseries of the Thirty Years' War the interests of culture and science were thrust into the background. The theological and philosophical text books of Melancthon, in which reformed doctrines were combined with a mild and eclectic Aristotelianism, for the most part ruled the teaching of the universities, and in spite of a few foreign influences from Ramus or Descartes it was only in the end of the seventeenth century that the first great philosophic writer appeared in whom the native tendencies of Germany were exhibited. Leibnitz, in his idealism, in his comprehensiveness, in his effort to reconcile all previous philosophy by a higher principle, deserves himself far better than Boehme to be called "Philosophus Teutonicus." It is with him that the great movement of German speculation commences, and his influence is discernible in all its subsequent progress. Dr. Zeller, therefore, begins his more detailed account of the history of speculation with the Leibnitzian philosophy. The subsequent history also he naturally divides into two periods: the period from Leibnitz to Kant, and the period from Kant to the present time. Till the *Kritik of Pure Reason* was published Leibnitz ruled over German thought with scarcely a rival. Wolff simply systematized and popularized, or perhaps we should rather say vulgarized, Leibnitz. He changed a somewhat ill-organized, occasionally even fantastic, but always deeply speculative, philosophy of the reason into a neat logical and symmetrical system of the understanding. And after Wolff no powerful influence modified the course of thought until Kant broke away from the ruling dogmatic philosophy, and by his study of Hume and other English writers was led to open up an altogether new line of investigation. After this one break the continuity of the history of German speculation is not again interrupted by foreign influences. Scarcely any writer not German even took any notice of the idealistic movement of thought in Germany till it was completed in Hegel. After the time of Hegel Dr. Zeller recognizes no philosopher of anything like his importance. Isolated writers have, he thinks, made valuable contributions to our knowledge of special departments of thought, and especially to psychology, and the general advance of the sciences necessarily forces a reconsideration of many things in Hegel's philosophic criticism of science. The future philosophy must, he declares, "enter into a closer relation with science than it has hitherto done, and complete its too exclusive idealism by a sound realism." The book ends with these significant words: "The life of Germany

has in the last thirty years entered upon a new phase in which its political and economical labours have received an unexpected expansion, in which it has had to encounter new problems, and has attained to results of which formerly we could scarcely have ventured to dream. But as in this outward region everything depends upon this, that Germany should not by outward success be led to forget the spiritual and moral conditions that have secured it, so the future of German philosophy must depend upon the degree in which it succeeds in keeping its eyes alike open for the facts of nature and for their deeper inward connection, for the subjective and objective elements of conception, for natural causes and the ideal reasons of phenomena."

It is impossible within moderate limits to criticise in detail the execution of a work of such compass as this. We shall therefore only make a few general remarks upon its merits and defects.

1. As a whole the book is a specimen of the best kind of popular writing. There is, as Dr. Zeller says in his preface, a kind of popularity to which no history of philosophy can pretend without ceasing to be of any value. But that power of judicious selection, distinct arrangement, and clear yet accurate exposition which were shown by the author in his *History of Greek Philosophy* do not fail him in this slighter work. Though so much has to be compressed in it into so small a space it has none of the proverbial dryness of epitomes. With no less accuracy than the *Handbook* of Erdmann, it is far more readable. Some of the sketches, especially of writers of secondary importance, such as Hamann and Jacobi, have a vividness and suggestive force of expression such as can be only attained by one who is master of his subject, when he gathers the result of his wide knowledge and matured thought into a concentrated picture.

2. There is a certain disproportion visible between different parts of the book. The lesser lights of the Leibnitzian and Wolffian school are treated with more than sufficient detail; and on the other hand, towards the end there is an undue compression of material. The account of Hegel is perhaps the least satisfactory portion of the volume, and reads in parts almost like a table of contents.

3. In the first part of the history the author is specially successful in tracing the connection of the theories of Leibnitz and Wolff with the later German philosophy. He shows very clearly that the attempt of Leibnitz to reconcile opposite views never got beyond the conception of a somewhat artificial "harmony." His Monadism wavered between an extreme individualism in which God was merely a name for the external agreement of the Monads with each other, and a Pantheism like that of Spinoza, in which God was all and the Monads but modes of His attributes. Again, the psychological theory which he opposed to that of Locke, that all knowledge is developed from within, is irreconcilable with his admission of an essential distinction between our apprehension of the eternal truths of reason and our apprehension of empirical and contingent facts. From the first of these difficulties Wolff frees himself mainly by ignoring it, but in regard to the second he makes the latent dualism of the system still more evident by dividing every branch of philosophy into two parts, a rational and an empiric part. Kant's rejection of the Leibnitzian identification of sensation and thought was therefore not without a justification in Leibnitz and Wolff themselves. The clear, logical method of Wolff also did much to betray that which is really the weak point in the philosophy of Leibnitz and his predecessors of the Cartesian school, namely, that they never examined the character and origin of the metaphysical categories which they employed. The Wolffian philosophy is a pure philo-

sophy of analysis, and while it introduced distinctness and system into German speculation and freed it from the authority of scholastic tradition, on the other hand by its very definiteness it laid bare to the eye of Kant the assumptive and arbitrary character of its first principles. Kant's distinction of analytic and synthetic judgments *a priori* at once proved the delusiveness of this system of nominal definitions, showed that there was no real progress possible on such a method, and prepared the way for a more productive movement of thought.

4. The exposition of Kant is given with Dr. Zeller's usual clearness and accuracy. He has however repeated an old error about the meaning of the passage against idealism in the second edition of the *Kritik* (p. 772, Rosenkranz's edition): "We must," he says, "assume that there is a reality different from ourselves and corresponding to our sensations. Kant seeks to show this in opposition to Berkeley's idealism in the second edition of his *Kritik*, where he says that the empirically determined consciousness of our own existence proves the existence of objects outside of ourselves, for the change of our states in time can only become conscious in reference to something that is permanent. And as our existence in time already presupposes this permanent something it cannot be something in ourselves, but only a thing that is without us." In this statement there seem to be two errors, for the passage referred to is directed not against what Kant calls the dogmatic idealism of Berkeley, but against the problematic idealism of Descartes, and in the second place it does not assert the existence of a real thing, or "thing in itself" independent of our representations. Kant had previously in the *Æsthetic* (p. 46) asserted that external phenomena are real in the same sense as internal phenomena; and to confirm this he here attempts to show that we could have no apprehension of the phenomenal self, that is of the phenomena of the inner life given under the form of time as real, unless we had at the same time the apprehension of the phenomena of the external world given under the form of space as real; in other words he argues that the knowledge of ourselves as phenomena or objects of experience presupposes the knowledge of external things as phenomena or objects of experience. (Cf. *Kritik*, p. 778.)

5. Dr. Zeller remarks that the boldness and confidence which characterized German speculation in the period after Kant, has now given place to a hesitating, tentative, and critical spirit. The differences and disputes between the various sections of the last great school of philosophy seem to show that there are problems which its master had imperfectly considered; and the advance of science, as has already been mentioned, has made manifest the imperfection of Hegel's hurried idealistic criticism of science by revealing the incompleteness of the data upon which it went. Hence there has arisen among German students of philosophy, a desire to retrace the history and reconsider the logic of the whole idealistic movement of thought from its beginning in Kant. The productive period being ended, and its results seeming to be insufficient, it is natural to go back to the foundation and to examine what errors have been made in laying it. Dr. Zeller is one of the chief representatives of this historical and critical tendency; he is not a Kantian or a Hegelian, though he believes that Kant was the beginner of a new era in philosophy, and that Hegel only developed the results necessarily involved in the principles of Kant. He thinks that by a reconsideration of the work of Kant, especially in the light of a more advanced psychology, we may be able ultimately to arrive at an idealism of a sounder kind than the system of Hegel. This view need not here be criticised, as indeed Dr. Zeller only

imperfectly indicates how he would develop and apply it. We are afraid that its result would be a mere compromise, an eclectic dualism without principle or unity. And if, as we gather, it would base metaphysics on psychology, it would necessarily lead to the abandonment even of the essential principles of Kant. At present, however, we mention it merely to explain the critical and tentative attitude which Dr. Zeller adopts in the latter part of his history. By this also we may explain why it is that he seems so much more successful in analyzing and criticizing the secondary than the primary writers of this period. His review of Schopenhauer, for instance, is considering its limits wonderfully complete, and in its result almost crushing; while his remarks on Fichte, Schelling, and Hegel are somewhat fragmentary and partial, rather affecting isolated difficulties and special results than the general principles of their philosophy.

EDWARD CAIRD.

*Old-Fashioned Ethics and Common-Sense Metaphysics*, W. T. Thornton. Macmillan and Co. 1873.

IN his work on Labour Mr. Thornton assailed two assumptions, generally accepted by economists, that there exists a definite wages fund, and that the price of labour and other things depends upon supply and demand. It is too soon to say whether his success will result in a modification of the terms of political economy, or only in leading the public to make a slightly larger abatement from the results of economists; but upon the whole the book was a success. The author's present work must be pronounced a failure, but it is not a failure of a discreditable kind. A good man struggling with adversity is, we all know, an edifying spectacle, and an able man out of his depth is an instructive one, especially when the victim has ability enough to keep his head above water, and to look about him from first to last. *Old-fashioned Ethics and Common-sense Metaphysics* is an attack on the prevailing tendencies of cultivated opinion about as acute and about as vigorous as the late Mr. Buckle's attack on the prevailing belief on the subject of Providence, or Professor Tyndall's attack on the prevailing belief of pious people on the subject of Prayer. Mr. Thornton does not succeed any better than Mr. Buckle or Professor Tyndall in understanding what he attacks, though in his case, at any rate, the failure is not due to want of goodwill and painstaking. Taken by themselves, the account of utilitarianism and that of Darwinism might pass muster as long as the writer keeps to exposition, but when he comes to criticism it is plain that he does not understand the body of postulates which lie behind what he describes and criticises.

Utilitarians are used to being misunderstood; perhaps we might add that they are used to misunderstanding their critics. Perhaps the reciprocal misunderstanding may be traced up to the fact that Bentham was a jurist, and occupied himself much more with what is "mutable and therefore improvable in morality" than with what is permanent, and so came to imagine that all morality rested on the safe and powerful instrument he had devised for revising the legal and moral code of eighteenth century Toryism. Mr. Thornton allows utilitarians the benefit of a classification of pleasures, which, considering that the majority are incapable of the highest, is a very large concession for an opponent to make; his criticism consists mainly of examples of the costliness of virtue, and of a fairly successful attempt to show, by a series of extreme and imaginary cases, that utilitarianism would justify what existing morality condemns, and condemn what existing morality recognizes as virtuous. Of course utilitarians would take refuge from such criticism in the assertion of the importance of general maxims; and if

pressed to admit that this assertion itself is an argument against weakening the authority of general maxims by revising them, they would find plenty of room for retaliation at the expense of Mr. Thornton's doctrine of abstract indefeasible rights, which is connected with some of the crudest theorizing about the social contract which has ever been printed.

In the essay on History's Scientific Pretensions the author concedes Mr. Buckle's premises with some reservations and distinctions to which he attaches an incomprehensible importance, and attacks his conclusions, or rather some of their corollaries, with incomprehensible earnestness.

The essay on Hume is decidedly better, though the theory of a causation is treated as an error of detail largely due to the fact that Hume had omitted to notice that we have ideas of ideas, as well as of impressions. Such a criticism is more than inadequate, but the writer takes the obvious objections with great spirit, and insists effectively enough on the dislocation of the familiar indispensable machinery of thought which results from Hume's analysis, and on the contrast between the essay on Causation and that on Miracles, though here again we feel that the writer very much under-estimates the impressiveness of what is coming to be known of the complex order of the world. But very much his best point is that after all Hume was a sceptic, as he called himself, and therefore is hardly to be taken seriously; that his method is not meant to lead to conviction, and that it is abused when people try to make it an instrument for imposing very unwelcome convictions upon Mr. Thornton.

It will be convenient to speak of the three remaining essays (on Huxleyism, Recent Phases of Scientific Atheism, and Limits of Demonstrable Theism) together. Mr. Thornton makes Descartes the starting-point of speculation, but he repudiates both Berkeley's idealism and Huxley's quasi-materialism, and by the aid of the assumption that it is impossible for death to give birth to life he not only demolishes (to his own satisfaction) the essay on Protoplasm, but builds up a curious theory of spiritualism, according to which all matter is mediately or immediately the avatar of some intelligence not necessarily the highest. This reminds us both of the theosophy of the Cabbala and of Schopenhauer's and Hartmann's—theories of a will pervading nature which only attains to consciousness in man; fantastic as it sounds, it is hardly so empty as Berkeley's singularly ingenious reduction of *esse* into *percipi*. But it hardly harmonizes so well as the writer supposes with the familiar argument from design which he still finds as convincing as Paley found it, and as a large number of intelligent men will continue to find it as long as the most advanced school of speculation shuts itself up in the conviction that the argument is not worth refuting. It was not to be expected that a theist should resist the temptation to quote the Religion of Humanity as a specimen of *la credulité des incrédules*; it is a more decisive specimen at any rate than the rejection of Mr. Thornton's aphorism about the impossibility of death giving birth to life. The "limits of demonstrable theism" are of course stretched to the utmost; on the writer's principle it is impossible for the creature not only to be but to imagine anything higher than the Creator, and in this way we have a standard of perfection which makes the origin and continuance of evil a serious difficulty. This is discussed with more vigour than poetry in several hundred lines of *terza rima*. The solution which the writer finds wholly satisfactory is simply the *naïve* dualism of the Zenda-vesta, which is reached after an exhaustive dissection of the subterfuges of ordinary theists. After all it is not the least plausible of the forms of optimism, though it may be doubted

whether it would stand the criticism of Mr. Browning's Caliban. Its real importance is not of a kind to be affected by criticism, and the interest of the book does not depend upon the value of the views it contains; nor upon the not very remote possibility that when centuries enough have passed they may seem as respectable as Plutarch's. What is really interesting and important, if not exactly satisfactory, is that an undeniably able man with a shrewd, robust, and candid intellect should have come to hold and preach such opinions, and that there should be no recognized authority capable of setting him right. After all it is possible to make unanswerable objections to a theory without understanding it, and therefore Mr. Thornton's book may be significant as one symptom among many that if the traditional intellectual synthesis be finally overthrown it will be succeeded by a period of intellectual anarchy whose duration is hard to calculate. G. A. SIMCOX.

### JOHN STUART MILL.

WE have lost in John Stuart Mill the best philosophical writer—if not the greatest philosopher—whom England has produced since Hume: and perhaps the most influential teacher of thought, if we consider the variety as well as the intensity of his influence, that this country has ever seen.

Originality of the highest kind he only showed in one department—the theory of method and evidence; but the unequalled mastery of method which his logical speculations developed, his patient tenacity and comprehensiveness of study, his rare gifts of exposition and discussion, and the controlled fervour of his intellectual and social enthusiasm enabled him to do in other departments work equally important in forming the minds of his contemporaries. Indeed some of his other work, as e.g. his *Representative Government*, has more finished persuasiveness than his treatise on logic, just because it shows so little travail of new thought: its merit lies in arranging in a lucid and systematic form the best results of current debate, with a careful and judicious selection of points, and a grasp at once easy and close of all the fundamental notions. In political economy, again, the amount of his original work is not great; it is almost entirely contained in a small volume of *Essays on Unsettled Questions in Political Economy*, published thirty years ago, and cannot be compared for importance with the speculations of Ricardo or even Malthus. Still the services which he rendered to the science of plutology were such as probably no other man could have rendered, and may be fairly regarded as inferior to those of no economic teacher since Adam Smith. These services were chiefly of two kinds. In the first place he brought a higher degree of philosophical reflection to bear upon his exposition of the common doctrines of the science, and attained a less imperfect consciousness of the assumptions included in his premises and the limits to the applicability of his conclusion than his predecessors had shown; avoiding at the same time the confused and sterile logomachies in which the principles of the study had been involved by inexpert dialecticians. And secondly he was impelled, partly by his keen human sympathies and strong practical interests, partly by the wider conceptions of the study of social phenomena which he had formed under the powerful influence of Comte, to restore to political economy that natural connexion with the general science of society and art of government which it had almost lost in the hands of Adam Smith's successors.

A somewhat similar judgment may be passed upon his contributions to metaphysics, except that he never attempted a systematic exposition of metaphysical doctrine. It was characteristic of his philosophic temper that neither for denial nor affirmation would he venture into regions of speculation where he could not make his footing sure, however tempting and well-trodden the road might be. Nevertheless what he did publish on the subject, though not extensive in amount (if we except purely critical matter) nor requiring much effort of independent thought, is yet valuable and important. It fell to him to sum up, and that with sufficient fulness, though as it

were incidentally, the results of English empiricism in its positive phase; for the system which Locke initiated and to which Hume gave consistency and precision while developing it to purely sceptical conclusions, assumed in Mill's mind the attitude of cautiously constructive dogmatism. The plan of construction had been laid down by Brown and James Mill, and the elaboration of its details has been carried on in our time by other thinkers: what J. S. Mill did was to formulate the method with peculiar distinctness and estimate with caution and candour the extent of the philosophical beliefs that could be attained by it. The negative side of this estimate is given in different parts of the *Logic*; its positive side in a few admirably written chapters of the *Examination of Hamilton*.

It was however in logic or methodology that Mill's highest gifts found their proper sphere. The exact value of his theory of reasoning and proof we are not now concerned to appraise; but there is no doubt of its novelty and interest. We may feel too that it was a task especially worthy of an English thinker to take up the problem at which Bacon laboured and attempt a fresh solution of it with the data supplied by the triumphs of modern science, while at the same time composing the quarrel between the old Organon and the new, which had practically remained open for two centuries. Since modern science and empirical philosophy revolted from the Aristotelian logic no reconciliation had been attempted; and the single important change that logical teaching had undergone in the adoption, after Kant, of the purely formal conception of the study had only made the breach wider. English metaphysics, from Locke to Brown, had remained contemptuous of logic, and scientific specialists had remained contentedly ignorant of it. It required a rare combination of philosophic insight and comprehensive scientific culture even to conceive definitely the task which Mill set himself, and which he at least so far achieved as to revolutionize the study of logic in England.

It is somewhat singular, considering the extent to which Mill's name is commonly identified with utilitarian ethics, that his treatise on this subject should show so little of his usual skill. The sentiment that pervades it is attractive; but the book is hastily put together, and the system seems incompletely reasoned and even incoherently expounded. On the other hand his essays on *Liberty* and *The Subjection of Women*, though somewhat less close and careful in argument than his larger works, have great literary excellence, and were perhaps the most effective of his writings—perhaps because the intense enthusiasm for human progress which the studied composure of his philosophical style partly conceals was allowed freer expression in these popular essays. This is not the place to speak of Mill's public career; but our notice would be incomplete if we did not dwell for a moment on the simple and noble passion for the universal realization of a high ideal of human well-being which burns like a hidden flame at the core of his social philosophy. It is this enthusiasm, controlled as it is by a severe reverence for facts and a perfect philosophical sincerity, which more even than his dialectical gifts has given him so large a share in forming the thought of the present generation; and it is this especially that now makes it difficult for those who have so long looked up to him as their teacher to estimate calmly how much the world is poorer by his loss. H. SIDGWICK.

### Notes on Scientific Work.

#### Anthropology.

**Ancient Greek Crania.**—An important addition has been made to the as yet very small number of Greek crania by the discovery of two more in a perfect state of preservation at Athens. The first is that of a woman named Glykera, as we learn from the tombstone, which was found as it had been placed by affectionate survivors. In the tomb beside the skeleton were two small painted vases, and on the tombstone was sculptured a parting scene of no great artistic merit. The second is that of an old man. It was found, 17th May, 1871, in a tomb, lying from west to east, and containing, besides, about thirty vases, a silver fibula, two gold rings, a gold plate, and some articles of bronze, but no inscription from which we might gather any knowledge of its tenant. The vases are of what is called the earliest style, that is the style which

prevailed in Greece previous to the introduction of the human figure as a subject of decoration in vase painting. Supposing the transition from the earlier to the later style of painting to have taken place shortly after the death of this old man, and assuming his cranium to be a normal cranium of his nationality and time, it is interesting to see how what has always been a remarkable feature in the earliest vases on which the human figure occurs—the smallness of the cranium—comes to be justified as a correct observation of nature. Of both crania, indeed, though that of Glykera cannot be regarded as of an early date, Virchow (who gives elaborate measurements and descriptions of them in the *Zeitschrift für Ethnologie*, Berlin, 1872, iv., p. 147) remarks that their capacity is much under the medium of modern civilized people and rather resembles that of savage races. At the same time the form of both is very beautiful, the vaulting of the male head being particularly fine. In occipital development it is much inferior to that of Glykera. But in spite of this difference the similarity between them is so great in the formation of the brow and face that there can be little doubt of both persons having been types of the same race.

**Excavations at Mzchet.**—The new number of the *Zeitschrift für Ethnologie* (Berlin, 1872, iv., p. 231) gives a continuation of the report on the excavations among the ancient tombs at Mzchet, near Tiflis, noticed in the *Academy* (vol. iv., 151). Having in the former part of his report described the natural features of the district and the construction of the tombs which he opened, and having discussed the method of burial and the few historical notices of the population in ancient times, the excavator now gives first a detailed account of the objects of art which he found, and secondly a number of startling conjectures in the matter of the religion of the old Iberians settled in that country. The articles found by him are (1) five engraved gems, of which the first is an onyx and bears on one side a figure of Victory and on the reverse an inscription, HXAPICI, which he interprets, as we think very freely, Icarus. The second an onyx set in a silver ring, has a figure of Priapus. The third is of lapis lazuli, and has the figure of an ass. The fourth and fifth are of onyx, and have, the one a figure of a hare, the other two ears of corn. The last three are set in silver. (2) A number of small glass bottles, or lacrymatories as they are called, which the excavator, to confirm his opinion that Herakles was one of the gods of the Iberians, describes as more or less resembling in shape the club of the Greek hero. (3) Bronze bracelets, hair-pins, and ear-rings ornamented with pearls, gold, and precious stones, bronze finger-rings, one being in the form of a key, and small bells, but no bronze weapons. Indeed the total absence of weapons, of whatever material, is one of the most striking phenomena in these excavations. (4) A large number of objects in iron, very much corroded, such as fibulae and hair-pins, to which are frequently added ornaments in gold, silver, pearl, or bronze. (5) Gold and silver fibulae, ear-rings, and finger-rings, set with stones and pearls, the various materials employed being emerald, beryl, hyacinth, pyrope (frequent), common garnet (rare), onyx, sardonyx, carnelian, chalcedony, agate, jasper, opal (rare), lapis lazuli, malachite, steatite, and sphæroederite. (6) An onyx, supposed to have been used in the game of draughts (*ludus latruncularum*), and a number of *astragali* and other bones, which from their frequency in the tombs of children are also thought to have been used as playthings. (7) A few specimens of pottery of a very rude kind, and apparently without ornament, beyond that of glaze. While thankful for these facts we must decline to accept conclusions arrived at in the following manner (p. 235): The pin of these fibulae has the form of a dagger or cross. In the pin lies the symbolical meaning of the fibula. The cross is the symbol of Ammon, the source of divine life. It is also equivalent to the hammer of Hephaestus, and therefore Hephaestus was a god of the ancient Iberians. As fibulae of this same pattern are found all over Europe, the worship of the Greek god must, if such evidence be sufficient, have been very widespread. We have already noticed his identification of the glass bottles as symbols of Herakles, whom he believes to have been the Iberian war god. The process by which Hermes, Dionysos, Astarte, and Priapus obtain each a place in the Iberian Olympus is equally instructive if much more difficult to follow.

**Canopic Jars.**—Some astonishment was caused by the discovery in North Germany of one of those vases familiar in ancient Egypt, fashioned in the shape of a human face, and named after Canopus. It was found to be ornamented with certain unintelligible figures or signs, which Professor Georg Ebers, of Leipzig (*Zeitschrift für Ethnologie*, 1872, iv., p. 90), now explains as imitations of hieroglyphics such as occur on genuine Canopic vases. His conclusion is that an Egyptian vase of this kind had found its way so far North in the course of Roman commerce, and been imitated by a native potter.

**Roman Tombs in Mecklenburg.**—Another, now the seventh, Roman tomb has been discovered in Mecklenburg, containing a skeleton in perfect preservation and over a dozen articles of pure Roman antiquity.

**Ancient Indian Carving.**—In the *Bulletin of the Essex Institute*, iv., No. 11, F. W. Putnam describes a curious carving in soft slate which was found with arrowheads of white quartz at Turkey Hill, Ipswich, Mass. It is probably a neck ornament, and the character of the carving conveys the idea that the instrument by which it was pro-

duced was of rough stone. It is about two and a half inches long, and represents a fish; the caudal fin is perforated, probably for the purpose of suspension. The dorsal fin points the wrong way, and is notched along the upper edge to indicate the fin rays. The carving is undoubtedly of Indian manufacture, and was probably worn as a "medicine." A drawing representing the natural size accompanies the paper.

### Geography.

**African Exploration.**—The mission of Dr. Nachtigal from the Emperor of Germany to the Sultan of Bornu, a country lying to the south-west of Lake Chad, and the discoveries made by this traveller in the previously almost unknown region of Tibesti, in the centre of the Eastern Sahara, have already been noticed in the *Academy*. After a long silence the news has reached Gotha that Dr. Nachtigal arrived at Kuka, the capital of Bornu, in July, 1870, and fulfilled his trust by making over the presents of the Emperor William to the Sultan. Dr. Nachtigal has since undertaken a series of explorations branching from this central point, and in 1871 made a most important journey, full of interest in respect to geography and natural history, visiting the countries of Kanem, Egai (Ege), Bodele (Bâtele), and Bôrgu or Bûrku, lying north-eastward of Lake Chad and between that lake and the country of Tibesti which Dr. Nachtigal had formerly explored. With the exception of Kanem, which was visited by Dr. Barth in his journeys of 1850-55, these border countries of the Soudan and the Eastern Sahara have hitherto been known only by report. In this journey Dr. Nachtigal made the very valuable discovery that the river named the Bahr-el-Ghazal (which is not to be confounded with the tributary of the Nile of the same name, the basin of which has recently been traversed by Dr. Schweinfurth) flows out of Lake Chad for 320 miles to north-eastward through an extensive and fertile valley in which part of the country Bôrgu lies, at a still lower level than the region round Lake Chad (830 feet above the sea). In Northern Bôrgu Dr. Nachtigal found a range of mountains, believed to extend from Tibesti to Darfur, of great elevation, one of the passes being not less than 7,878 feet above the sea. In February, 1872, the date of his last letter, he purposed to make a new excursion to the country of Bagirmi, south-east of the Chad, respecting which the whole of our information is derived from Dr. Barth's journey to its capital, Messena. It will be seen that Dr. Nachtigal's travels have already opened out a vast region of the Eastern Sahara. No mountains approaching the altitude of those which he has found in Bôrgu have hitherto been discovered in any part of the Sahara region west of the Nile or between the Soudan and the Atlas range. His determination of an outflowing river from Lake Chad is also of the highest interest in its bearing upon a contested point of physical geography—whether all lakes without an outlet are necessarily salt or brackish. Lake Chad, the waters of which are certainly fire-hot and potable, has been held up as the great exception to this rule, and the equilibrium has been believed to be maintained by great evaporation alone. Dr. Nachtigal's discovery, however, places Lake Chad precisely on a parallel with the corresponding Lake N'gami in the southern area of African continental drainage, which overflows periodically by the Zouga, and with Lake Titicaca in the Bolivian highland, discharging its surplus waters to the Pampa Aullagas lake by the Desaguadero.

The last part of the *Zeitschrift der Gesellschaft für Erdkunde zu Berlin*, viii., Heft 1, 71, contains an important paper by F. Marthe on Russian reconnaissance of the country east of the Caspian Sea. He describes in detail each possible route to Khiva as regards length and water supply, of which abundant statistics are given. The paper is illustrated by a map prepared by H. Kiepert from the observations of the Russian Military Survey.

### Chemistry.

**The Decomposition of Salts.**—Twenty years ago Rose studied the action of alkaline carbonates in solution on solutions of metallic salts. He found, in the case of powerful bases like the oxides of barium and silver, that pure carbonates were formed and, when weak bases were employed, that water played the part of an acid in expelling an equivalent amount of carbonic acid so that the precipitate consisted of a compound of a carbonate and a hydrate. With very weak bases carbonate alone was formed. Of late this subject has been further investigated by Joulin (*Comp. rend.* lxxvi., 558), who has determined the effect of varying the degree of dilution of solution and the relative amount of material taken. He selected carbonate of soda and a salt of manganese for his experiments. At ordinary temperatures, with equivalent quantities of the salts, and with an equal degree of dilution of each solution, but with increasing dilution as regards the quantity of salt used, carbonate of manganese alone is for a long time deposited; when however the solutions become more dilute than 1 : 200 a mixture of carbonate and sesquioxide of manganese is deposited, the filtrate containing bicarbonate of soda. When the carbonate is in excess the amount of oxide increases, even in very concentrated solutions, the quantity increasing with that of the carbonate. When the salt of the metal is in excess the concentrated solutions throw down pure carbonate; after a certain degree of dilution is

attained it becomes mixed with a quantity of oxide, and this increases as the solutions are made more dilute. When the salts act on each other through a membrane the same changes ensue. At 0° the quantity of oxide formed is less than at ordinary temperatures even when a considerable excess of carbonate is added. At 100°, on the other hand, the action of equivalent on equivalent is attended by the formation of a considerable amount of oxide and three equivalents of the metallic salt have to be taken to cause the precipitation of pure carbonate. The salts of silver, copper and mercury exhibit the same phenomena. As regards the rate of change with a dilution of 1 : 10 it was found that 94 per cent. of the carbonate of soda underwent decomposition at once or, more strictly, in the first five minutes; with a dilution of 1 : 8,000 only 11.97 per cent. was decomposed in that time. The addition of some sulphate of soda, the product of the decomposition, to the two solutions before they are mixed causes still further retardation of the decomposition, especially by increasing dilution. In a solution of one part of carbonate of soda in 1,000 parts of water to which had been added in equivalent proportion manganese solution of the same degree of dilution 60.27 per cent. of carbonate underwent immediate decomposition, 78.85 per cent. by the end of one day, 79.88 per cent. after two days, 86.56 after four days, 87.23 after seven days, 92.67 per cent. after fifteen days, 94.90 per cent. after thirty days. An excess of one or other salt considerably retards this action, and if it amount to 50 or 75 equivalents may impede the decomposition during twenty-four hours. These results are of great value in their bearing on accurate chemical analysis.

**The Aerolite of Shergotty.**—This meteorite, which fell on the 25th August, 1865, at 9 a.m., and of which a short account was given in the *Academy*, ii., 540, has recently been examined by Prof. Tschermak, of Vienna (*Jahrbuch für Mineralogie*, 1872, No. 7, 733). The fracture of this stone is distinctly granular, the grains being of nearly equal magnitude. The eye is able to distinguish two minerals, one of a bright brown colour and with very distinct cleavage; the other transparent, and with a strong vitreous lustre. Further microscopic and chemical examination led to the detection of five constituent minerals. An augitic mineral forms the chief mass of the stone: it has a greyish-brown colour, and exhibits double refraction with slight pleochroism. The cleavages and optical characters would suggest its being classed with diopside; the analysis given below, however, shows that it cannot be regarded as a member of the augite group:—

Silicic acid .. .. .	52.3
Alumina .. .. .	0.2
Iron protoxide .. .. .	23.1
Magnesia .. .. .	14.2
Lime .. .. .	10.4

100.2

A second constituent of this meteorite consists of colourless granules with vitreous lustre and conchoidal fracture, which proved to be distorted octahedra. They have a hardness equal to 6, and possess the following composition:—

Silicic acid .. .. .	56.3
Alumina .. .. .	25.7
Lime .. .. .	11.6
Soda .. .. .	5.1
Potash .. .. .	1.3

100.0

This new species has received the name of *Maskelynite*. The remaining minerals are a yellow silicate, probably bronzite, magnetite, and magnetic pyrites. In its mineral and chemical characters the stone of Shergotty resembles the meteorites of Stannern, Juvenas, Jonzac, and Petersburg, which as a class are widely separated from the greater number of the aerolites.

**Thermo-chemical Researches.**—The paper of Thomsen's on this subject is continued in *Pogg. Ann.*, 1873, No. 3, 368. In his examination of the phenomena attending the combination of carbon and hydrogen he has observed that the formation of acetylene from carbon and hydrogen is attended by a considerable absorption of heat. The formation of ethylene from acetylene, by combination with two more atoms of hydrogen, is accompanied by a disengagement of heat, about 44,000°. The formation of marsh gas from ethylene, by further combination with four more atoms of hydrogen, is likewise attended by a development of heat of 51,720°. The decomposition of ethylene into marsh gas and carbon is accompanied by an evolution of heat; if the carbon separates as graphite it amounts to 31,310°. The author asks, How shall an explanation be sought for the remarkable inactivity which carbon displays towards hydrogen except at the very highest temperature, although after it has combined with it to form acetylene the affinity of hydrogen appears to be unsatisfied, so that further quantities of hydrogen readily combine with acetylene, and a development of heat is a consequence of the action. The conclusion Thomsen has arrived at is that carbon, whether in the form of charcoal, graphite, or diamond, exists in an inactive or passive condition, from which it must first be educed before it can enter into combination with other elementary substances, and that an expenditure of force is necessary to effect the conversion of carbon from this passive condition into that exhibited

by other elementary bodies. The magnitude of this expenditure has not yet been exactly determined; but it appears to be about 7,000° for each atom of carbon. The fact of the rapid increase of the specific heat of carbon with rising temperatures, established by Weber (see the *Academy*, iii., 173), supports the assumption that carbon, before it can form compounds, must undergo a considerable change in its molecular condition.

**The Iodine Spring in Java.**—E. Reichardt has published an analysis (*Chem. Centralblatt*, 1873, No. 12, 182) of the mineral water of Genock Watoe, in Java, which contains iodine and is used in the treatment of diseases. It has a slightly alkaline taste and contains little particles in suspension, amounting to 0.0029 per cent., which readily take fire. The water strikes a blue colour with starch, especially after the addition of nitrous acid, and the presence of a considerable amount of iodine is indicated. The specific gravity of the water is 1.0198, and 1,000 cc contain 2.6969 grammes of solid substance, 0.0119 gramme of which is iodine. The existence of iodine in the free state in mineral waters which have been preserved for a long time has been noticed in other instances and ascribed to the action of carbonic acid or the decomposition of iodide of ammonium.

**Indium.**—Roessler records in the *Jour. Prakt. Chem.*, 1873, No. 1, 12, the results of some experiments on the preparation of double salts of this metal. Its specific heat led Bunsen to correct the atomic weight of indium in consequence of which the oxide became  $\text{In}_2\text{O}_3$ . With the view of determining whether this compound resembles other sesquioxides in forming alums Roessler attempted their preparation. The ammonium alum is easily formed, and when dried in air contains the 24 atoms of water. If however the salt be pressed and dried at 100° it loses with considerable ease six atoms of the water of crystallization. The crystals are octahedra with the faces of the cube strongly developed. The author was unable to prepare the potassium or sodium alum, salts of the following formula being produced:

By boiling a solution of this potassium salt for a long time a white pulverulent precipitate falls down which has the composition:

It is quite insoluble in water, but is readily taken up by hydrochloric acid.

**The Meteorites of Montlivault and Beuste.**—M. Daubrée has recently acquired for the Paris collection two meteorites that fell some time ago in France, but which have hitherto escaped notice, and are only now placed on record (*Der Naturforscher*, 1873, No. 17, 167). One fell at Montlivault, in the Department Loir et Cher, on the 22nd July, 1838. It weighs 510 grammes and is in the form of a three-sided pyramid. It is finely granular and consists chiefly of olivine and augite, in which grains of nickeliferous iron and magnetic pyrites are enclosed. It belongs to the group to which the name of leucite has been given. The other stone fell at Beuste, Basses Pyrénées, in May, 1859. Two pieces were found lying about 700 metres apart; one weighs 1.4 kilogrammes, the other, weighing 420 grammes, was driven into the ground to a depth of 50 centimetres. The black crust has a thickness of from 0.4 to 0.5 of a millimetre and the specific gravity of the stone itself is 3.53. It is a member of the Chantonite group and most nearly resembles the Pultusk meteorites. The grey very compact mass of the stone is penetrated in every direction by a mineral in black veins which anastomose and exhibit irregular ramifications.

**Electrical Discharge through Carbonic Acid and Marsh Gas.**—A. and P. Thenard have examined the effect of the silent discharge of electricity through a mixture of equal volumes of these gases (*Der Naturforscher*, 1873, No. 17, 168). After the lapse of ten minutes the condensation of the mixture became apparent, and in six hours it was complete. When the supply of gases was renewed the condensation continued and became more rapid. The product is a transparent viscous fluid which adheres to the sides of the vessel and after some time assumes a light amber colour. They have not yet produced sufficient quantity of the material to determine its composition. When a series of sparks is sent through the mixture a different result is noticed. In one hour the volume of the gaseous mixture is doubled and a considerable amount of carbon deposited. A. Thenard had previously ascertained that sparks split up carbonic acid into carbonic oxide and ozonized oxygen.

## Philology.

- Conlectanea Critica* ad C. Lucili Decadem Primam, Scripsit C. M. Francken. Amsterdam: Van der Post. 1869.
- Conlectanea Critica* ad C. Lucili Decadem Secundam et Tertiam, Scripsit C. M. Francken. Amsterdam: Van der Post. 1871.
- G. Lucili Saturnarum Reliquiae. Emendavit et adnotavit Lucianus Müller. Accedunt Acci (praeter Scaenica) et Sui Carminum reliquiae. Leipzig: Teubner. 1872.

THESE two works on the great satirist of Republican Rome are both written by two friends, and are both interesting. M. Francken's work, though edited by the Dutch Royal Academy of Studies, and in quarto, is the smaller and in most senses less important of the two: it contains indeed only 158 pages, and often does barely more than quote the words of the fragments; on the other hand the discussions on particular passages when more detailed are always interesting, and instruct, even when they fail to convince.

The articles on Lucilius' use of Greek words, on the persons who figured in his Satires as friends or enemies, on the passages in which Horace seems to have imitated him, are all good and full: and we believe most students would be glad if the contemporary and rival editor had made larger use of the materials he has accumulated, as well as of the ingenious conjectures he has from time to time put forward.

But in knowledge of the chief source of the Lucilian remains, Nonius, M. Francken cannot claim to equal his contemporary. Herr Müller's contributions to the Rheinisches Museum have for some years been directed to this author; and his Nonian studies have added to the last edition of Ribbeck's *Fragmenta Tragicorum Romanorum* much that is new. Again, Herr Francken's acquaintance with the minutiae of Latin metre cannot be put in comparison with that of the author of the treatise *De re metrica*—a book which, even if not equal to its author's own high estimate of it, and containing perhaps more than a few disputable assertions, is the work of a man of considerable susceptibility to rhythm, which is certainly not the case with M. Francken, nor indeed with many other scholars of the present day. Herr Müller indeed considers metrical ignorance to be so decidedly on the increase that he has taken the trouble to fill up the greater part of the lines left fragmentary with the amount of feet required to complete them. This is surely in exaggeration; we cannot help thinking that his German, and we are sure that his English, readers will resent these trochees and iambi, still more the dactyls marked to fill up the hexameters, as intrusive and unnecessary.

The text with its accompanying *apparatus criticus* (this last carefully done and valuable in itself, even where Herr Müller's conjectures do not convince) is followed by a brief but generally sufficient commentary. Much of this is devoted to questions of orthography—of course a most perplexing point in Lucilius, whose ninth book was in part occupied with settling the spelling of his own time. Here again we feel happy in having the judgment of an editor trained in the school of Ritschl; and Herr Müller, usually arrogant and self-asserting, is content here to follow the guidance of the MSS., and without aiming to reproduce the Lucilian era—a task almost impossible—to present the spelling of the first century after Christ. In particular cases, however, where the MSS. on the whole pretty uniformly follow the standard of the later age of Roman literature, e.g. in writing *is*, *us*, *os* where the *s* is proved by the metre to be elided; again, in writing *est* for *'st*; Herr Müller uniformly rejects them, and gives *i*, *u*, *o*, *opust*, *homost*, &c. In this, we should suppose, most philologists will agree with him; traces of all these seem to be still found; yet we could wish they were more decided in the first three instances, and we are not at all inclined to accept *'st* as proved for Cicero and Virgil, and decidedly dissent from Herr Müller's *mihist*, *bonast*, &c., in Tibullus and Propertius, even if it be adopted for Catullus. Nor is the mode of stating the orthographical difficulty which we find on p. xvii. of the Introduction in any way true or adequate. It cannot be said that the mediæval copyists persecuted forms like *ai*, *ai*, *'st*, *u'* with deadly hatred; they were far too ignorant not to be abject and even slavish in their adherence to the originals which they copied; they were, speaking generally, the merest machines, and were not only without hatred, but without partiality. It is certainly not to the Middle Age that we are to ascribe the rare occurrence of archaic spellings; it must have set in long before. It seems indeed highly probable that the spasmodic attempt which the literary men of the age of the Antonines made to revive the phraseology of earlier Rome was accompanied by a modification of the standard

orthography of the day. This might arrest for a time the tendency—natural always, and attested in our own literature by the eighteenth century editions of our earlier writers—to ignore the grammatical forms and peculiarities of successive epochs, and merge them all in a common grammar. But we know from A. Gellius as well as from Quintilian how often the speculations and investigations of the literati of their time were at variance with the readings of their MSS.; and it may well be that the corrupt copies were cheaper and more widely circulated than those more accurately written. This would no doubt vary with various writers; Virgil was transcribed with religious reverence, and Ribbeck's text may reproduce for us the actual hand of the poet; but very few writers have come down to us in such excellent preservation as Virgil (a fact proved by the improbability of even a single passage requiring emendation), and even if we possessed an entire Lucilius we could scarcely feel confident that our MSS. gave us the author's own orthography, though the estimation in which the Romans held him might perhaps make them more than usually careful not to deviate from any text once received as authoritative. As it is, the main source of our knowledge of Lucilius is Nonius; and even where we can decipher Nonius, we do not know what kind of MSS. he used. Sometimes he may merely be copying some previous excerpter; though it is more likely that he used a collective edition of the Satires, as he specifies each book in quoting them. At any rate Herr Müller's view that he possessed two different sets of excerpts, one containing books i.-xx. with xxii., the other the whole number of thirty books except xxi., xxiii., xxiv., xxv., requires more elaborate exposition than he has given it at p. xviii. Introd.; nor can we see in Nonius that African negligence which is here ascribed to him (the *stupor Nonii* is an habitual phrase with Herr Müller), still less believe without a great deal of investigation the statement which we are commanded to grasp by the teeth, that of all the excerpts in Nonius not a single verse, with the exception of perhaps a few passages from post-Frontonian writers, is taken from MSS. of the complete works of the various authors to whom they belong. That must have been a golden age of excerpt-mongers when one of the most elaborate glossaries of which we know was taken entirely from anthologies. Surely, if we may form any idea of Roman philologists from those of modern times, half the satisfaction of composing a work like that of Nonius would be in the study and constant re-perusal of the originals. This does not in any way affect the probability of a revised edition of Lucilius for the use of schools, such as Herr Müller supposes (p. xvii.); if, that is, we may conclude from a passage of St. Jerome (in *Rufin.* iv. 2, 367, ed. Benedict.) that he was read by boys, for it seems unlikely that the works of a writer so coarse as Lucilius must have been should have been placed in the hands of youth entire: and yet we do not know of any passage in which expurgated editions are distinctly alluded to, and it may be doubted whether, e.g., the Satires and Epodes of Horace or the Metamorphoses of Ovid were a forbidden article in the school-rooms of Rome.

We feel some hesitation in speaking of the text of the Lucilian fragments as constituted by Herr Müller. As compared with the edition of Gerlach (Zurich, 1846) it is satisfactory, but the edition of Gerlach is utterly unworthy of him, nor can it be said of Herr Müller's Lucilius that he has completed what was left undone by Dousa. To confess the truth, there are signs of haste and temerity not a few; additional labour would, we think, have greatly improved the book. The editor is far too ready to accept his intuitions of what Lucilius must have meant—a fault always, even in the hands of Lachmann or Ritschl, but far greater where

the matter dealt with is a set of isolated fragments. We could wish that Herr Müller had consented to be less aspiring in this particular; in many cases the alterations are in our judgment very improbable, not to say absolutely wrong. Thus in the passage quoted by A. Gellius, xviii. 8, when Lucilius is ridiculing the *ῥηοιστέλευτι πάρισα* and other affectations of the school of Isocrates, the MSS. give these words:—

*Si minus delectat quod atexnon et eissocratium est,*

Herr Müller gives *quod τεχνιον Eisocratiumst* instead of the received *ατεχνον et Is.* This may be taken as a fair specimen of what we hold to be a mistake in criticism, the alteration of an author's text to suit a preconceived opinion. It is not that *τεχνιον* is in itself improbable; but that *ατεχνον* suits the requirements of the passage sufficiently to make alteration unnecessary. Take again the definition of virtue:

*Virtus est homini scire id quo quaeque abeat res,  
Virtus scire homini rectum utile quid sit honestum,*

to change *scire id* into *sciei* is certainly no improvement; surely the ear of the author of the *De re metrica* was unusually dull when he went out of his way to introduce this elision; nor can it be thought probable to alter

*Alcmenam atque alias lenam ipsam denique nolo*

into *Alcmenam, atquei alias, Ledam i. d. nolo* instead of the generally accepted *Helenam*: more especially as we are told mysteriously of an "arcana ratio musica" which forbids *amphitapoe* to be elided, a case, we should have fancied, much more open to doubt. On what principle again does Herr Müller (xi. 16) write *hic stricosu' bouinatorque ore improbi' duro* instead of Hertz's *Hic 'st tricosu', &c.*, which is at once better metrically and at least as near to the MS. *hic stricosus* or *sitricosus*? The matter is put out of doubt by a gloss of Placidus, *bobinator trilosus et inconstans*. It may be observed in passing that another gloss of Placidus, *Mysta . . . summysta qui sub eo est* is almost enough to show that Francken's *subμειρακωδες* for the *symmeiraciodes* of MSS. (v. fr. 6, ed. L. Müller) is right: the word is in fact only half Greek, and can hardly claim a place in Greek lexicons.

The same hastiness is perceptible in the uncritical way in which Herr Müller has treated the difficult and doubtful question of *ec* as a form of *ex*. The MSS. of Nonius preponderate in favour of *exferre*; and it is not unlikely that the MS. *haec uestimentis* in Non. 350 represents *ex vestimentis*, as the *ec* of *ecquis equando* is often thus corrupted. But this does not justify us in writing *eddicam* for the MS. reading

*Nunc Nomentani quae ex testibus ipse rogando  
Exculpo, haec dicam,*

still less for juggling the strange word *ependi* out of *apelli* or *apepelli* in Non. 339, nor does it follow because *Ecbatana ecquis* are sometimes written *Elbatana etquis*, that in the fourteen extra-Lucilian cases quoted from Nonius where *et* is followed by an ablative it represents an original *ec*. It may also, we think, represent *e*, sometimes *ex*; at any rate few will be satisfied with the palaeographical explanation (*e* confounded with *t*) of Prof. Munro, which is sufficiently disproved by the occurrence of *etquis*, &c., in the earliest and best MSS. of Virgil. Corssen admits *ec* before *f*, and we are disposed to allow that Herr Müller may be right in his *ec furnacibz' ec flamma ec fenestreis*; but it does not follow that *et maconis manu* is a corruption of *ec m. manu, eo medio* of *ec medio, et* or *ea fontia* of *ec fontibz'*. It is at least possible that *ex medio ex fontibz'* are the right forms here concealed. So fond indeed is Herr Müller of this *ec* that he cannot help foisting it into a fragm. of Sueius' *Pulli* (No. 3), where the MSS. give *escam hic iure*.

A similar question might be raised as to the propriety of introducing *lum li* for *illum illi*. It is true that once or twice

the shortened form seems indicated by the MSS., e.g. *eodem pacto gannis* may possibly be *e. pacto 'lo gannis*, though it can hardly be *e. pacto li ogannis*; but this does not justify Herr Müller in writing *uderatorem lum, defrudet li parcat* for the *u. illum, defrudet ali parcat* of the MSS.: and the editor himself seems to fluctuate on the matter, for xxix. 63, where the MSS. give *in mellis spem esse omnem*, he writes in the text *in me illis*, and only suggests *in me lis* as a possibility. This seems to us a strange reserve; for of the four instances above quoted this is perhaps the least harsh: it certainly does not look barbarous or modern, like *pacto li ogannis*.

It would be uncandid to deny that with all these defects Herr Müller's Lucilius shows no want of ingenuity. We can recall many instances of clever emendation, some as certain as emendation can be. Thus *uiat* for *uim*, *ubertim* for *uberi*, *caelum bibat* for *caelum uiuat*, *διαλλάσσων* for *diallaxon*, *poeticon* for *poeticon*, are not likely to be improved.

In some cases, however, we prefer the emendations of previous editors. Thus in the difficult lines from B. iv. which appear in Nonius, *Tisifone tilene (tinete) pulmonibus atque adipē unguem Excoctum attuli Eumenidibus sanctissima Erynis*, Francken's *tithē e*, and Boot's *Eumenisin* are not supplanted by Herr Müller's *Tityi* and *Eumenidum*; nor can it be thought satisfactory in the author of a treatise on metric to ignore the possibility of a hiatus in *attuli*, and to read *attulit* without remark. Take again Lachmann's restitution of iv. 22—

*Quod si nulla potest mulier tam corpore duro  
Esse tamen tenero maneat quin (MSS. maneatque) such' lactero  
Et manans uber (MSS. manus uberi) lactanti in sumine sidat.*

Here Herr Müller has, we think, seen the truth in retaining *manus* and writing *ubertim*; but in every other way his text of the fragment is a retrogression. He writes *Quod sin ulla—manat quoi*—and (will it be believed?) *Ei manus*. And then we are told (p. 210) that Lachmann had tried his hand on the fragment in vain, and that Herr Müller has settled it, with scarcely any change, for ever! If again Apuleius informs us that Lucilius attacked two youths named Macedo and Gentius, this is no reason for altering the reading of the MSS. of Nonius, *hic est Macedo si agrion longius flaccet* into *h. e. Macedo, si Gentiu' l. f.*, and rejecting Quicherat's clever *si eugion l. f.*: or at least so plausible an emendation should not have been passed over in silence. And how can Herr Müller correct, as he has done, *rate ad catulos accedere (t) inultum* into *ferai ad c.*, overlooking the obvious *iratae*?

With all these drawbacks the new edition of Lucilius is a very considerable contribution to our knowledge of the earlier literature of Rome. The editor indeed is so well satisfied with his own performance as naively to confess his astonishment at the difference between Dousa's edition and his own, and to institute a comparison between his Lucilius and the immortal Lucretius of Lachmann. This is on a par with his arrogant abuse of Corssen, Usener, Ribbeck, and other leading philologists of Germany; it may be forgiven, but it does not diminish the distrust with which his own rash statements or unconvincing conjectures are received.

R. ELLIS.

**Morosi's Studies on Italian Greek.** [*Studi sui dialetti greci della terra d'Otranto, del Prof. Dott. Giuseppe Morosi, preceduto da una raccolta di canti, leggende, proverbi, e indovinelli nei dialetti medesimi.*] Lecce, 1870. VIII. and 214 pp. 4<sup>o</sup>

THE Greek language is at present still spoken in eight small towns situated in the neighbourhood of Otranto and Lecce: Martano, Calimera, Castrignano, Zollino, Martignano, Sternatia, Soleto, and Corigliano; not long since Greek was also heard at Melpignano, Curse, Caprarica, Cannole, Cutrofiano,

and at a more remote period at Galatina. In Prof. Morosi's excellent treatise we receive not only a very rich collection of popular songs, proverbs, and tales in the dialect of this district, but also an exhaustive investigation as to the character and origin of this peculiar Greek, together with a history of the Greek colonies founded in Italy during the Middle Ages.

We quite agree with Prof. Morosi that the grammar and general character of this branch of the Greek language do not allow us to doubt its mediæval origin. This Greek shares all the peculiarities of the modern dialects at present used in Greece itself. It is indeed an original development of mediæval Greek, and it is but natural to expect that it should have been strongly alloyed with Italian words and inflexions; but there is absolutely nothing to justify the inference that this dialect might be directly descended from the Doric Greek once spoken in that part of Italy. It appears almost certain that Doric Greek had completely died out under the sway of the later Roman Emperors; and Prof. Morosi adduces evidence to show that the Greek colonies, remnants of which we have before us in the Italian *Greci* of our days, were founded in the reigns of Basilius I. and Leo VI.—i.e. the time in which the Byzantine power was at its height in Italy (p. 206). The arguments employed by Prof. Morosi are not so much historical as linguistic, and it is interesting to follow them while difficult not to be convinced by them.

The texts which form the first part of the volume have little merit when considered as poetry, but are of great value in a linguistic point of view. It looks strange at first sight to see Greek printed in Latin letters; but in the first place the inhabitants of this district themselves do not employ Greek characters,\* and secondly it would have been difficult to express the pronunciation of this Greek adequately in anything but the Latin alphabet. There are some peculiarities which render this dialect somewhat perplexing to a scholar not accustomed to the strange freaks of modern Greek. Take e.g. the proverb given p. 77, *O sciddo pu elistà en daccanni*. It is not so easy to see that this is in Greek characters *ὁ σκύλος ποῦ ὑλακτῆ (= ὑλακτεῖ) ἐν δαγκάνει*, "a dog that barks does not bite." But would it have been possible to convey in any other way the peculiar interchange of λ and δ in *sciddo*, the Italian pronunciation of σκ as sc, the shortened form ἐν instead of ἐν, and the strange *elistà* for ὑλακτῆ, i.e. ἐλυφτῆ? [In the same manner we believe that *psero* is less puzzling than ψέρω would be = ξέρω, ξεῖρω. Θ appears sometimes as a mère s (*pesàno, πεθάνω*); sometimes as t (*télo, θέλω*); sometimes as a mere h (*hiatéra = θυγατέρα*—a form which we recommend to Prof. Key's notice.) An ξ is occasionally turned into σσ, but appears also as fs, e.g. *smifsane* (p. 56) = σμιξανε, *maddfsi* = μετάξι (not μέταξα, as the author says). With regard to the vowels it is instructive to see that η frequently appears as e, cf. p. 98, where *emèra, fserò* (ξηρός), *gheràzo* (ξηράζω), and other instances are given, some of which occur also in the ordinary forms of modern Greek, e.g. *sidero σίδερο*, which occurs in *Solomos* and is the only form given by Somavera. We accept this fact as a distinct proof of the ancient pronunciation of η as a (German) e-sound, in spite of Prof. Morosi's protests. In fact Mullach's arguments are quite ridiculous;

\* A Greek correspondent quoted by Prof. Comparetti in his *Saggi dei dialetti greci dell' Italia meridionale* (Pisa, 1866) writes:—"En su grijo ma ta grammata grica, jadi emi en grafome; ce su pianno grammata pu mu ndiazzutte, andè ene psero esprimepsi o nulimma pu turtea;" which means in modern Greek Δὲν σοῦ γράφω μὲ τὰ γραικὰ (ἐλληνικὰ) γράμματα, διὰτὶ (διότι) ἡμεῖς δὲν (τὰ) γράφομεν· καὶ πιδῶ (μεταχειρίζομαι) τὰ γράμματα ποῦ μοῦ εἶναι εἰδιωμένα, ἀλλως δὲν ἐξέρω (τὰ) ἐκφράσω (expmere = ἐσπριμῶν) τὸ ὁμίλημα (τὴν ὁμίλιαν) τοῦ τόπου.

it suffices to say that he adduces γίγας as an argument of η = ε, because γίγας = γηγενής. Or is there more weight in the supposed identity of ηκω and ἴκω? But a dialect which has remained isolated for centuries does not change its pronunciation very much, and it is very probable that the Byzantine colonists who settled in Italy in the eighth or ninth century still pronounced η = ε. This is confirmed by another peculiarity, i.e. the pronunciation of υ as ου, which is clearly ancient (p. 100).

A characteristic change is that of χ into h, e.g. χῶμα being pronounced as *homa*, or rather *huma*. This is exactly what we should expect on Italian soil and under the influence of an Italian sky: comp. χήν = Lat. (*h*)anser, χόρτος = *hortus*.

We think that even the desultory observations taken—almost at random—from Prof. Morosi's work will suffice to show that this is a most interesting publication. It is in fact very creditable to the Italian school of philologists trained up by the excellent professor Ascoli, to whom Mr. Morosi has inscribed his volume. We cannot but speak very highly of the painstaking and methodical execution of this work, and there are but very few details in which we should venture to disagree with the author. He has difficulty in explaining the origin of the term *godspina*, "giovane sposa," but neither what he suggests (p. 160) nor Ascoli's derivation (p. 213) from the Slavonic *gospodina* appears probable. We think that it is merely an abbreviation of οἰκοδόσποινα, comp. the common Greek form οἰκοκυρά (or νοικοκυρά, comp. νῶμος = ὥμος).\* The term *plonno*, "mi corico, dormo," is wrongly derived from ὑπνόνω (p. 174); it should be rather the common ἀπλόνω used in the sense of ἀπλόνομαι, "I stretch myself." In the mediæval compositions which will shortly be published by the present writer this word occurs several times of persons lying down to sleep. We have also been much interested in the peculiar use of πολεμῶ and its derivatives in the sense of *lavoro la campagna* (p. 162 and p. 167), which confirms and supplements my own note on the earlier version of Βελισάριος (Hamburg, 1873), v. 438. With regard to *ascadi* = ἀσκάδι, "fig," Prof. Morosi's suggestion (p. 213) is no doubt right.

We are glad to see that the living dialects of the Greek language are now undergoing very careful investigation, but we would wish that all works in this department might be as well executed as Prof. Morosi's *Studi*. The indefatigable editor of the *νεοελληνικά ἀνάλεκτα* published by the Philological Society Παιδαγωγικὸς Ἀθηνῶν at Athens, M. Deffner, promises a collection of dialectic words: let us hope that we shall get it soon, and in a convenient form. There are many happy expressions to be found in these dialects; as an instance we may quote from Italian Greek ἀρμωσία "matrimonium," which we think much prettier than the ordinary ὑπανδρεία. It is in this way that we shall more and more perceive the uninterrupted connexion between the present speech of the Greeks and the ancient dialects, which is after all the most satisfactory refutation of the absurd theory of a complete disappearance of native Greek in Greece itself.

W. WAGNER.

### Intelligence.

The newly discovered mediæval poem which we mentioned some time ago appears now to be by a certain Ἀκρίτας. The MS. is at present on its way to Paris, and the whole is about to be edited conjointly by Mr. E. Legrand and Constantine Sathas.

Lovers of mediæval literature will be glad to hear that Mr. Ferdinand Meister has added an edition of Dares Phrygius *De Excidio Troiae* to his former edition of Dictys Cretensis (*Ephemeris Belli Troiani*). The new edition of Dares contains also an elaborate introduction giving a résumé of the investigations concerning the mediæval imitations of Dares.

\*This suggestion has also been made by the reviewer in the *Literarische Centralblatt*. σὺν δύο ἐρχομένη.

The new edition of Cicero's Epistles by Wesenberg is now complete. This Danish scholar had already been favourably known to the students of Cicero by many excellent and brilliant emendations, but he has now conferred a great boon upon all lovers of Cicero by giving the results of his critical investigations in a handy edition easily accessible to all, while his former publications were very difficult to obtain. He promises to add a separate fasciculus in which he intends to comment at more length on the most important of his numerous emendations.

The first two volumes of a critical edition of the Iliad by La Roche (whose school edition was reviewed in the *Academy* some time ago) have just been published by Messrs. Teubner. The critical apparatus appears to be very valuable, but judgment must be suspended until the appearance of the volume containing the Prolegomena.

An interesting volume of Greek Popular Songs, most of them taken from a MS. anterior to the year 1550, will be shortly published by Messrs. Maisonneuve at Paris. It is edited by Mr. Legrand, who has also added a French translation of these poems.

Messrs. Teubner are about to publish a large edition of the Roman history of Dionysius of Halicarnassus, by Prof. A. Kiessling of Greifswald. As is well known to our readers a smaller edition of the same author has already been issued by the same editor in the *Bibl. Teubneriana*. The new edition is intended to bring a complete critical apparatus, an Index verborum, Prolegomena and Quaestiones Dionysianae on the sources of the author and some grammatical and stylistic peculiarities, together with an account of the editor's emendations. We may add that many new emendations are to be expected, especially in the first volume, which the editor himself allows to be in want of careful revising. We hope that we may in time also get an edition of the critical and rhetorical treatises of Dionysius by the same editor, these works being greatly in want of critical revision, and moreover accessible to most scholars only in the disgraceful Tauchnitz edition.

Messrs. Teubner advertise also new editions of *Justinus* by Franz Rühl, a gentleman already favourably known by two scholarly treatises on the mediæval circulation and the MSS. of this author.

Dr. Hermann Peter is about to issue a school edition of Ovid's *Fasti* with German notes.

The late Professor Holtzmann's *German Antiquities* have just been published. They include an edition, translation, and elucidation of Tacitus' *Germania*. The editor is Alfred Holder.

Professor Bursian's important work on the Geography of Greece is now complete in two volumes, with 15 maps.

*Rivista di Filologia* e d' Istruzione classica; direttori G. Muller e D. Pezzi. Roma, Torino, Firenze: Ermanno Loescher. Fasc. 1-9. 1872, 1873.—We have received the fasciculi of a new and important philological journal published monthly in Turin under the direction of Professors Giuseppe Müller and Domenico Pezzi. The *Rivista di Filologia* is one of the most hopeful signs of that renewed activity in classical study which we rejoice to perceive in Italy, and it may be interesting to our readers to learn by whom it is conducted. Professor Müller, though by birth a German speaks of Italy as being to him "terra ospitale, e, come seconda patria, pregiata e diletta." He is now at Turin, having taught in former years at Pavia and Padua, and his most recent work appears to be a Greek lexicon. Pezzi has published lately a Latin grammar on modern philological principles, and contributes some important articles on classical instruction in Italy, besides minor papers, in one of which he ably defends and illustrates the locative origin of the genitive of the O declension. Besides the directors the most frequent contributors are G. Flechia, Gaetano Oliva (of Rovigo), Vegezzi-Ruscalla, D. Carutti (of Rome), D. Comparetti (Professor of Greek at Pisa), and Vigilio Inama. Of these Prof. Flechia is well known as the first Italian who published a Sanskrit grammar and as the first who gave scientific treatment to the Italian dialects on comparative principles, and as a successful and laborious teacher of the philology of language. All readers of the *Academy* know the name of Comparetti from Liebrecht's recent article on his *Virgilio nel Medio Evo*. Inama has published a Greek grammar; Carutti has edited the Satire of Sulpicia, and defends its antiquity against Boot and Teuffel. Francesco d'Ovidio (another contributor) has written on the origin of the single form of inflexion in the Italian noun. Vegezzi-Ruscalla appears to be strong on the Romance languages in general: he notices the curious indefinite article in Provençal *en* and *na*, which he is inclined to derive from the Celtic. A derivation of Flechia's (noticed p. 147) is interesting as showing how serious etymology may destroy ethnological theories based on guesswork. The Sardinian *nuraghe* have often been interpreted as Phœnician in name and origin. Whatever may be their origin, the name can hardly be appealed to any longer, as he seems to have proved that it is only a corruption from some provincial Latin derivative of *murus*, parallels to which exist as Lombard *muracca* and Venetian *murazzi*. It is perhaps a question whether the Latin equivalent would not rather be *muratae* than *muraces*, notwithstanding the parallel between *furraghe* and *fornacem*. The chief foreign contributors are Th. Mommsen, and G. M. Thomas (of Munich); the former gives two papers, one on a graffito of the year 243 A.D. on the handle of a silver cup in the Turin Museum, the other on some points in the geography of ancient Piedmont, the chief being the determination

of the site of Clastidium in the neighbourhood of Placentia. Perhaps the most important contribution besides those already touched upon is a fragment of a Greek philosophical treatise from a palimpsest MS. of the Gospels at Bobbio, in which a passage of the *Parmenides* is quoted. These details do not by any means exhaust the interest of the journal, which promises to be a very useful organ of communication. It is not surprising that the writers should be much more familiar with what is being done in Germany than in England; but we hope that English publishers will send new philological books to the *Rivista*, and that English scholars will do something to support it. There ought to be at least as great a community of feeling between Italy and England as between Italy and Germany, or rather philology ought to rise above nationality entirely and draw its vitality alike from every soil.

#### ENGLISH DIALECT SOCIETY.

Mr. SKEAT writes to us that the formation of an "English Dialect Society" has been successfully accomplished, and already consists of about forty members, several of whom are known writers upon English dialects, or have contributed valuable publications to the London Philological Society or the Early English Text Society. But the list ought to contain many hundred names, and probably will do so as soon as the society's existence becomes generally known. With this view, the subscription has been limited to only *half* a guinea per annum, for which sum every member (who has *paid*) will receive one copy of every publication issued during the year. The objects of the society are to bring together all those who are interested in the matter, to combine the labours of collectors by providing a common centre and means of record, to publish (under proper revision) MS. collections of words, and to supply information to collectors. One of the first things to be done is to make a complete list of all books *not* in the usual "printer's English." This should contain a list of all Lowland-Scotch books later than A.D. 1707 (see Murray's *Dialect of the Southern Counties of Scotland*, p. 74), and all books in English dialects that are not mentioned in Mr. J. R. Smith's list, published in 1839.

The names of intending subscribers and workers should be sent in as early as possible, in order that they may appear in the amended prospectus, to be issued in a few weeks. Rough copies of the prospectus can be had on application to the hon. secretary. The treasurer is the Rev. J. W. Cartmell, Christ's College, Cambridge; the subscription, half a guinea per annum; the bankers, J. Mortlock & Co., Cambridge; the secretary, Rev. W. W. Skeat, Cintra-terrace, Cambridge; and the publishers, Messrs. Trübner & Co.

Donations of spare copies of local pamphlets in dialectic spelling (many of which are inexpensive but not always easy to obtain) will be thankfully received. Information about Scottish books is much wanted; probably the names of many are to be found in booksellers' catalogues in the north. The society has already to thank Prince Louis Lucien Bonaparte for his present of a copy of his "Deuxième Catalogue des ouvrages destinés à faciliter l'étude comparative des langues Européennes," together with a supplement.

## THE ACADEMY.

"INTER SILVAS ACADEMI QUÆRERE VERUM."

Vol. IV.—No. 72.

Readers are reminded that the mention of New Books, Articles, &c., in our lists is intended as a guarantee of their importance.

The Editor of THE ACADEMY cannot undertake to return communications which are not asked for.

The Editor cannot reply to questions from authors respecting the notice of their books.

The next number will be published on Monday, June 2, and Advertisements should be sent in by May 28.

## Zoological Society's Latest Publications.

PROCEEDINGS OF THE SCIENTIFIC MEETINGS OF THE SOCIETY for 1872, cloth, containing the papers read at the Scientific Meetings in 1872. With 75 Plates, mostly coloured, 47s. 6d.; with Plates uncoloured, 14s. 6d.

INDEX to the Proceedings of the Zoological Society from 1830 to 1847, from 1848 to 1860, and from 1861 to 1870, in three volumes. Price 6s. each volume.

#### TRANSACTIONS OF THE SOCIETY.—VOL. VIII.,

Part 4. Price 24s. Containing Dr. JAMES MURIE, F.L.S.—On the organization of the Casing Whale, *Globiocephalus (Delphinus) melas*, Traill. With nine plates.

#### VOL. VIII., Part 5. Price 24s. Containing

Professor P. MARTIN DUNCAN, F.R.S.—A description of the Madreporearia dredged up during the expeditions of H.M.S. "Porcupine" in 1869 and 1870. With eleven plates.

REVISED LIST OF THE VERTEBRATED ANIMALS now or lately living in the Gardens of the Zoological Society of London, 1872. Price 2s.

These may be obtained at the Society's Office, 11, Hanover Square, W.; at Messrs. LONGMANS', Paternoster Row, E.C.; or through any Bookseller.

## A New System of Philosophy.

## General Literature.

*Red Cotton Night Cap Country* ; or, *Turf and Towers*. By Robert Browning. Smith, Elder, & Co. 1873.

WHEN Mr. Browning published *Dramatis Personæ* in 1864 it seemed permissible to suppose that his reputation was in some sense fixed. It was generally admitted that his poetry had certain faults ; it was coming to be generally admitted that it had also certain merits whose value might be open to discussion but in any case deserved to be rated high. It seemed too that criticism might be spared the sterile labour of balancing the faults against the merits when one grew visibly out of the other, and might settle down at leisure to the fruitful work of analysing the sources of the author's undeniable power, if it was too early to hope to ascertain his literary rank. Since then Mr. Browning has resolved to make the British public like him ; he has set to work with a will to get rid of the faults which went naturally with the merits that he had ; perhaps it was hardly surprising that in spite of his stupendous cleverness he has fallen into other faults which naturally go with merits which he will never have. We do not mean that his work is falling off, or that his own public have a right to be disappointed, but they have a right to feel disconcerted. Every new book is a surprise to them, they never know what to expect of him ; not because he is always putting forth new powers, but because he is always inventing fresh uses for old powers. The mere astonishing bulk and completeness of the *Ring and the Book* extorted too unlimited admiration for it to be obvious at once that clearness was purchased at the expense of prolixity, and even if it had been obvious it might have been retorted that *Sordello* was prolix without being clear. But *Balaustion's Adventure* and *Prince Hohenstiel-Schwangau* suggested a more alarming suspicion : it almost looked as if in rubbing off his roughness Mr. Browning would rub off his distinction too—as if he would file away asperities till nothing was left except an ingeniously intricate arrangement of too sterling common sense. Such fears were happily set at rest by the appearance of *Fifine* : the profane might object that the old harshness and obscurity were if possible exaggerated, but the faithful easily overlooked those familiar blemishes (and after all the meaning had more

room in the Alexandrine couplets than in the rhyming heroics of *Sordello*) ; it was enough for them to recover the old shifting subtlety of suggestion, the rapid depth of insight, which were not to be found elsewhere. Even in *Fifine* however it was possible to trace new aims which mingled themselves with the familiar charm : the dramatic power was unimpaired, but it was less disinterested, less impersonal than in most of the earlier work : the author seemed resolved to get out of the ideal medium altogether into the actual workaday world, and, though this was not altogether a novelty, he was preoccupied with some didactic purpose. Both the last characteristics come out very strongly in *Turf and Towers* ; but, like everything else that Mr. Browning has published since *Dramatis Personæ*, it compels us to revise our estimate of him. Certainly there is no lack of clearness here, there is no excess of rapidity to create confusion, but the distinctive feature of the book is a resolute pursuit of purely artistic graces. Talleyrand used to say that the Duke of Wellington spoke French with a great deal of courage : Mr. Browning has practised elegance and irony and other refinements of a Platonic dialogue with a vehement uncompromising energy which cannot but deepen our admiration of his prodigious intellectual force.

In form the book is an expansion and illustration of two conceits which appear to have occurred to the author in the course of a conversation with Miss Thackeray ; in substance it is an account of a recent *cause célèbre*, improved into a sermon against Ultramontanism and the particular form of pietism known by the convenient misnomer of Mariolatry. It seems Miss Thackeray has nicknamed a part of Normandy, and contemplates or contemplated writing a book with the nickname for title ; and he leads up to this statement elaborately for many lines, then he devotes many more to the startling suggestion which is only reached after three hundred and fifty lines—

"White Cotton Night Cap Country : excellent,  
Why not Red Cotton Night Cap Country too?"

As none of the Norman peasants wear red nightcaps, and as that part of Normandy is remarkably moral, of course the suggestion looks paradoxical whether we take it literally or symbolically. For the remainder of the prelude, which occupies nearly a quarter of the book, the author keeps playing with this paradox, exaggerating it, putting forth little feints in defence of it, coaxing odd varieties of suggestion out of it with

an inventive persevering ingenuity that is sometimes almost amusing, as where he suggests an exhibition of nightcaps to succeed the exhibition of old fiddles at South Kensington. All the while he is feeling his way to the real subject, the tragical fate of a retired goldsmith who lived with a lady who passed for his wife in the odour of ecclesiastical respectability as an extravagantly generous devotee of a miraculous image of Our Lady known as La Ravissante, a corruption, though he did not know it, of Rare Vissante, the old name of the district. His apparent blamelessness, substantial wisdom, and unbroken prosperity are dwelt upon with an emphasis that is not unimpressive, and then we have the announcement—

"Now comes my moment, with the thrilling throw  
Of curtain from each side a shrouded case.  
Don't the rings shriek an ominous 'Ha! ha!  
So you take Human Nature upon trust?'  
List but with like trust to an incident  
Which speedily shall make quite Red enough  
Burn out of yonder spotless napery!"

After this we have practically done with the first title, which explains how the book came to be written; but before we can come to the main story the second title has to be explained. It is better worth explaining than the first, for it really gives the key to the temper in which the author wishes us to approach the subject, and this time the explanation is got over in about three hundred lines. This is not too much to make us familiar with two metaphors, both subtle and significant, which are strangely intertwined with each other and with the subsequent development of the poem. After Mr. Browning has set forth with picturesque energy his grounds for the belief that the *débris* of ruinous buildings and of ruinous creeds ought to be cleared away at every æsthetic sacrifice, while the parts of the ruin which are still in stable equilibrium may be left undisturbed if desired, he proceeds to suggest another contrast between the ramparts on which the sentries used to pace and the smooth turf that they enclose below; and this is an allegory of the faith we profess to defend and the pleasure which we find it natural to enjoy. From this point the poem proceeds as Mr. Browning promised "so straight to end" with a very telling directness: Leonce Miranda was the son of a fervent Castilian and a sceptical Frenchwoman; he himself was endowed with exuberant physical vitality, which had no outlet except work in his father's shop in the week and a spree at the end of it. These escapades seem to have been kept within limits by a shrewd shallow cunning of which its possessor boasted in letters read in court. Of course these amusements were quite compatible with unshaken belief in La Ravissante and a firm intention to reform and settle down. The conflict between faith and inclination only began when he was permanently fascinated by a comparatively respectable and ambitious adventuress who in the first instance represents herself as an injured innocent, the victim of destiny in general, and "Lord N., an aged but illustrious Duke," in particular. The chronology of the first twelve years of the liaison is obscure, but the order of events was as follows: the hero discovers that his mistress is not a heroine, and has been maintained hitherto by one Cennino Centofanti, who is very ready to transfer his expensive favourite to her new possessor. Next the hero's brother and confidant, and then his father die, and his mother, who though sceptical by temper is in practice a strict Catholic, consents to tolerate the connection, which has to be avowed at last, as the lady's husband turns up in the person of a fashionable tailor established just opposite the hero's shop in the Place Vendôme, and brings an action for separation. The pair retire from the scandal to the country-house which Miranda the elder had bought at Clairvaux and restore it

if possibly rather too prettily, and live there very happily—the lady having a talent for knowing when she was well off, and the gentleman having a number of accomplishments which he carried far enough to give elegance to idleness. At the end of five years Miranda is summoned to Paris on business, as he has been spending rather too fast: some distant cousins who have managed the shop persuade the mother to exert her influence against a connection which she might once have broken off. As it is she only succeeds in provoking a painful scene, after which her son tries to drown himself; he is saved and nursed by his mistress, who spirits him up to assert his independence rather too harshly. Almost immediately after this he is summoned to his mother's death-bed, where the cousins have prepared a scene to persuade him that he has been guilty of killing her, in the not unfounded hope that he may be induced to atone for her death by giving up to them the wealth which has proved a snare to him. When the arrangements were almost completed Miranda shut himself up to read his beloved's letters before burning them, and conceived the idea that it would be a kind of expiation to burn his own hands with them. This is the central horror of the book, and we are prepared for it beforehand by many dark allusions which are so ingenious as to make us hope that they are not meant to be thrilling. The idea was carried out in a state of delirious exaltation which precluded all sense of pain, whence the surgeon who attended him inferred that he had been driven mad by spiritual terrors, while Mr. Browning finds a proof of the separate existence of soul and body, and Mr. Herbert Spencer, if his attention has been called to the case, might perhaps infer the independence of separate nervous currents and the power of one to neutralise others. This exaltation continued during the whole of Miranda's convalescence, only disturbed by a fear that as he was still haunted by the image of a woman he could not marry his expiation was incomplete. At last he was well enough to go out, and went straight to his mistress (whom the cousins had vainly tried to send on a wild goose chase to Portugal), brought her back with the announcement (which we suppose must have been really made as it leads to nothing in the poem) that her sex is changed and that she is his brother. Having now made the discovery that turf is solid as well as towers, in other words that he can calculate as certainly on his habitual desires as upon the beliefs which he supposes himself to hold, he determines to keep his property in the hope that in some form or other he will be able to buy the Church's leave to live with the woman whom he cannot give up. Accordingly he sells the business to his cousins on strict business terms, and goes down to Clairvaux to take religious advice. Mr. Browning it seems has a friend at Saint Rambert to whom he thinks poor Miranda might have applied with great profit, but he went to La Ravissante instead. Hereupon we have a very clever dissertation on the necessity of dealing with men according to their actual belief to prepare us to judge fairly of the action of the representatives of La Ravissante. They told the lovers a rather pretty story of a seventeenth century husband and wife in the neighbourhood who had parted to enter religion, and insisted unequivocally that it was *their* duty to follow such an excellent example; but as the lovers could not or would not part their advisers were content to accept their liberality in the hope that their alms might win for them the grace of conversion. Miranda gave lavishly, and among other extravagances went a pilgrimage of seven or eight miles on his knees, while his companion, who humoured his devotion, encouraged him to keep up his accomplishments: he painted pictures with his mouth, played the piano with his toes, and as he had artificial

hands made shot with them and never missed his bird. Two years passed not unhappily till on the twentieth of April, 1870, Miranda, who had been heard by one of the gardeners to speak of angels who would take him, was seen by the same gardener to step over the rails on the top of his belvedere and plunge forward. Of course he was taken up dead: his companion maintained that he had overbalanced himself in arranging the flowers: the author assumes that he had appealed to La Ravissante to work a miracle which would have converted him and the world. By his will he left his property to his patroness to be administered by his companion during her life. His cousins tried to set the will aside on the ground of insanity, but after a delay of two years it was affirmed on a trial where the materials for the book came out, and the author saw the lady in possession last autumn with a bright yellow chignon which he remembers though he has forgotten her face.

It is a serious misfortune to any man to have his heart set on living with another man's wife, especially in a country where marriage is indissoluble. Mr. Browning seems to think that this misfortune was immensely aggravated by Miranda's belief in La Ravissante, and it is probable enough that but for this belief he would not have burnt off his hands or jumped off the belvedere or even tried to drown himself; but Mr. Browning apparently wishes us to suppose that if he had seen through this belief he would have found it easier to part with his mistress, and here we find it hard to follow the author. Perhaps too he is over severe on the monks and nuns who took Miranda's alms: at worst their indulgence gave him two years of life in which if he did not conquer his love he did much to conquer his weakness.

Though it is to be regretted that Mr. Browning has made his story a vehicle for inadequate discussion of important theories this does not affect the value of his discussion of the two principal characters. Considering his intolerance of all the hero's attempted compromises with duty it is curious how sympathetically he handles the heroine. One hardly knows whether it is a compliment or not to say that her portrait reminds us of Balzac's chapter, "*Comme quoi le Rat est un animal constructeur.*" At any rate one gets a very clear and not unpleasant idea of a good-natured managing woman with a great talent for being responsive and much genuine active kindness resting on a foundation of cool quiet selfishness. She seems to have taken a very sensible view of the situation from first to last, though most readers will be inclined like the author to blame her for basing her estimate exclusively upon data which could be verified. Still better is the account of how the rich simple nature of the hero gradually gains depth and light and even something like purity in the conflict between two incompatible ideals, both, the author holds, unworthy of the loyalty which it strives to yield to both. As a result of the conflict he attains a full knowledge of the worth and strength of one of his ideals which can be tested here, and puts the power of the other to a test which has the merit of being decisive and is not irrational from his point of view. If the author had been seeking arguments against the hero's creed he might have found one in the difficulty of finding scope in that creed for recognition of this spiritual progress.

Perhaps Miranda's monologue before he leaps from the belvedere would have been richer and subtler if the author had not remembered a little too clearly that he was incapable of articulating his own thoughts; but even with this drawback it falls little if at all below the standard of Mr. Browning's best work, and it is led up to with an energy which doubles its value: consequently extracts cannot do it justice, but we extract some of the deepest and strongest lines, in which the hero states the problem of his life:—

"O you were no whit clearer Queen, I see,  
Throughout the life that rolls out ribbon-like  
Its silksilk length behind me, than the strange  
Mystery—how shall I denominate  
The unrobed one? Robed you go and crowned as well,  
Named by the nations: she is hard to name,  
Though you have spelt out certain characters  
Obscure upon what fillet binds her brow,  
*Lust of the flesh, lust of the eyes, life's pride.*  
'So call her and condemn the enchantress.'—'Crush  
The despot, and recover liberty!'  
Cry despot and enchantress at each ear.

You spoke first, promised best, and threatened most;  
The other never threatened, promised, spoke  
A single word, but when your part was done  
Lifted a finger, and I, prostrate, knew  
Films were about me, though you stood aloof  
Smiling or frowning. 'Where is power like mine  
To punish or reward thee? Rise, thou fool!  
Will to be free, and, lo, I left thee loose!  
Did I not will, and could I rise a whit?  
Lay I, at any time, content to lie?  
To lie, at all events, brings pleasure: make  
Amends by undemanded pain! I said.  
Did not you prompt me? 'Purchase now by pain  
Pleasure hereafter in the world to come!  
I could not pluck my heart out, as you bade,  
Unbidden, I burned off my hands at least.  
My soul retained its treasure; but my purse  
Lightened itself with much alacrity.  
Well, where is the reward?'"

G. A. SIMCOX.

### Notes and Intelligence.

We ought to have spoken sooner of two collections of reprinted papers by Dr. Dasent and Canon Kingsley issued respectively by Messrs. Chapman & Hall and Macmillan. Dr. Dasent's is entitled *Fest and Earnest*; the *Fest* consists of some political *jeux d'esprit* which had a *succès d'occasion* and of some energetic fooling about the bracing discomforts which cockneys can find in Færoe and the oddities of Wildbad. In the last there is a rather amusing Munchausenade about the great opal of the Shah of Persia; but in general the fun depends rather on a combination of intellectual vigour with high animal spirits than on any fresh or subtle sense of actual or imaginary incongruities. The *Earnest* consists partly of essays on English philology, which when first published did much to popularize what was then known, and even now would interest and instruct persons beginning the subject, and partly of a very vigorous and picturesque though not very critical version of the reigns of Magnus and Harold Hardrada, and as much of English history as is necessary to understand the invasion of the latter. This part of the book will have a permanent value until the Norse sources shall have been made accessible to English readers by a scientific historian.

*Plays and Puritans*, the best of Canon Kingsley's contributions to the *North British Review*, had already been reprinted in his *Miscellanies*. It certainly established two points of some importance: that the drama was in full decadence when suppressed, and was moreover almost as licentious as under Charles II., and that English gentlemen have adopted the Puritan standard of dress. The inference is that the Puritans were in their generation the representatives of good taste and good morals. A writer with more fairness would have remembered that Laud's High Commission fell quite as much because it harassed if it could not bridle the immorality of the gentry as because it enforced a ritual which has become universal; a writer with more insight might have observed that to be fruitful the discussion ought to begin at the point where Canon Kingsley leaves off. The essay on Sir Walter Raleigh and his times is an adroit and vigorous attempt to palm off pietistic effusion of a peculiar school as an explanation of historical facts. When the first two volumes of Froude's *History of England* appeared it was natural to claim them as a powerful support to Muscular Christianity: perhaps the Article is reprinted as a protest against the growing opinion that Mr. Froude has more fervour than faith, and that the clearness of his insight is hardly sufficient to warrant his self-confidence or excuse his inaccuracy.

We have received from Mr. F. D. Morice what we hope is only an instalment of a complete translation of the *Georgics* into the sevenline stanza of Chaucer. *The Bee* is a singularly close and faithful rendering of the Fourth Book, and at the same time a really spirited and delightful poem. The metre is managed with an original ingenuity which makes it convey a distinct reflexion of the rich harmony of Virgil's complicated system of cadences and pauses which check without breaking the stream of his music. Perhaps it would illustrate the measure of success which Mr. Morice has attained to compare his work to an arrangement of orchestral music for the piano, and we think this is almost or quite the highest measure of success that a translator of Virgil can attain. That this measure of success is anything but low will be shown by the following extract from this rendering of a passage which we select rather because the original is well known than because the translation is above the average:—

"His toil had failed, the ruthless bond was void,  
And thrice Avernus thrilled with dismal cries.  
'O love!' she wails, 'how are we both destroyed!  
O mad, mad deed! Lo, cruel destinies  
Summon me back! Sleep seals my swimming eyes.  
Farewell! In darkest shrouds of night I flee,  
And thine no more, stretch helpless hands to thee!'

She spake, and swift as vapour melts in air  
Fled from her husband's sight: he clutched in vain  
At every shade, and purposed many a prayer.  
No more she saw him: ne'er might Charon deign  
To grant him passage of the stream again.  
Where could he turn, that twice had lost his love?"  
What tears the Shades, what prayers the Gods might move?"

Almost the only fault we have noticed in this very brilliant performance is the use of "sky" without an article in the sense of "heaven."

We have received the first number of a new Parisian journal called *Paris à l'Eau-forte, Journal Hebdomadaire d'Actualité, de Curiosité, et de Fantaisie*. The preface states that the title has been criticised as "un peu ambitieux." Certainly it would lead one to expect something more than a few poor etchings placed as head and tail pieces to very foolish articles, and one confused illustration of an unpleasant war subject. "Nous ne comptons pas," say the editors, "fondre la grande ville dans une prose caustique à la façon de la perle de Cléopâtre." There is surely no need to "re-assure" their timid readers on this point. The first glance at the journal would, we should think, be sufficient guarantee against such a danger. The news of the "Chronique" of the journal is limited to the observation of a certain Annette who is seen in the illustration peeping through the jealousies of her window, and who remarks that "spring is a long time coming." The style of the illustration reminds us of those on the French match boxes.

In an article entitled "Extrémities Parisiennes" the author falls into raptures over "les pieds de Paris," and the artist illustrates the subject by two puffy, ill-drawn feet in sandalled and monstrously high-heeled shoes stuck out on an ottoman or fender in a very obtrusive and inelegant position, very different to Suckling's description of the feet that "like little mice stole in and out." Altogether a more trivial production than this *Paris à l'Eau-forte* has seldom fallen beneath our notice.

In the May number of the *Preussische Jahrbücher* R. H. notices a little book published by the family of Novalis (Fr. von Hardenberg), containing some unpublished letters from the Schlegels, the poet's brother Erasmus and others, with a few personal and domestic details that on the whole tend to confirm the estimate of his talents and character put forward by his later biographers. A passage from one of his own letters settles the question whence he derived the *nom de plume* by which he is most usually known: it was, as he says, "ein alter Geschlechtsname der Hardenberg's und nicht ganz unpassend." The same journal contains a notice of the German dictionary of the brothers Grimm, dwelling chiefly on the immense scale on which the work is planned, and an article on "Schön und Niebuhr" giving some interesting particulars relating to the political situation and attitude of the latter between 1809-1813.

It is stated that Mr. Mill has left directions for the immediate publication of his Autobiography, besides three works on "Nature," "Theism," and the "Use of Religion," one of which was to have appeared in the course of the summer.

*Les Pénalités de l'Enfer de Dante* is a little volume by the late Professor Ortolan, now published by his family, in which the influence of Roman law, the "written reason" of the Middle Ages, is traced in the punishments allotted by Dante to the various classes of criminals. An account of Brunetto Latini supplements the historical and legal notes.

In the *Revue des deux Mondes* (May 15) M. Fustel de Coulanges writes on *Les origines du régime féodal*, with special reference to the tenure of land under the Roman Empire and the Merovingians. He believes that the rise of the feudal system was due to causes entirely independent of conquest, and suggests that the owners of small allodial estates, who turned them into benefices for the sake of protection, formed for a time a class of tenant farmers intermediate between the actual cultivators who were more and more generally treated as serfs and the aristocracy which was gradually absorbing all the land into its own possession.

In the *Allgemeine Zeitung* (May 18, 19) M. Haug reviews very favourably the *Grammar of the Pashtu, or language of the Afghans*, by Dr. Ernest Trumpp, just published by Messrs. Trübner & Co.

On the 23rd of May Count Alessandro Manzoni died at Milan. He was born on the 8th of March, 1784; his mother was a daughter of Beccaria, whose influence may be traced in the historical appendix or *Storia della Colonna infame* which was added to the fourth edition of *I Promessi Sposi* and was intended to give a more general application to the arguments in Pietroberri's *Osservazioni sulla tortura*, written in 1777, though their publication was not ventured upon till 1804. Manzoni reprints passages from the evidence given under torture of the supposed *Untorelli*, and argues that even if the crime of which they were accused had been possible, and even if the torture had been legally and morally justifiable, the judges and the populace after the plague in 1630 were still inexcusable for the atrocities they committed without evidence or motive. Manzoni's earlier poems possessed little merit; in 1810 his opinions, which had been originally those of his grandfather and the French *idéologues*, underwent a change indicated by the publication of his *Inni Sacri*, which may have had some influence upon the form of Lamartine's *Harmonies religieuses*, but are themselves chiefly remarkable for the purity and simplicity of their style and diction; *Il Cinque Maggio*, the ode on the death of Napoleon (written in 1821), besides those qualities (which are of themselves nearly enough to give distinction while the Italian language continues as at present a magnificent instrument on which no one knows how to play) had an original thought (that Napoleon was a good Catholic) and a clear, concentrated force of feeling which places its poetical value quite out of reach of historical or political criticism. The two tragedies which he wrote about this time, *Il Conte di Carmagnola* and *Adelchi*, were welcomed by the romantic school, though the first at any rate is sufficiently frigid: the theme is not new, the jealousy of the Venetian Government for its best generals; but the dialogue has occasionally a degree of life and vigour not unlike Alfieri in his more prosaic moments. Of course it is by *I Promessi Sposi* that Manzoni will be longest remembered as he is now best known: the romance has suffered much by its use as a reading book, the severest test to which a work of the imagination can well be submitted, but it has survived the test. Its place in Italian literature would be more easily fixed if it did not stand alone, at the head of a host of perfectly insignificant imitations; on its own merits, though Manzoni had nothing like the creative fertility of Scott, his one work may fairly be placed on a level with some—not the worst—of Scott's many. Its qualities are substantially the same as those to which the great Scotch novelist owed his popularity, and the difficulty of making historical lessons amusing is met in the same way by connecting the interest of the story with passions or prejudices that are really matter of

history. Manzoni interprets the Italian sentiment on the subject of religion as clearly and imaginatively as Scott does the chivalrous feelings of a losing side under arms, and though the sudden conversion, like that of the "innominato," of a brigand chief into a devout Christian, may not be entirely explained by anything in his romance, such incidents were common all over Europe at an earlier date, and the only psychological objection to his delineation is that the virtues of the converted hero belong to a rather different age from his vices. In the seventeenth century such changes of life were not common, and it would be rash to say that Manzoni was wrong as to a particular case, but when they were common the Church was seldom content to leave her penitent to save his soul by the practice of merely secular virtues. A pamphlet, *Osservazioni sulla morale cattolica*, published in answer to some passages in Sismondi's History of the Italian Republics, might have been written by any earnest and moderate Catholic. For the last forty years he has lived chiefly in retirement; in 1860 he was made a senator of the kingdom of Italy, and in 1868, in spite of his advanced age, he took part in preparing a report on the possibility of introducing unity of speech throughout the country by taking the Florentine dialect as the basis for an authorized Italian dictionary. He argued ingeniously that it was probable that in the course of a year exactly the same things were said in every town of the kingdom only in different words, and concluded that it was simply to substitute one set of words for another. Of course this appeared sophistical to all but Tuscans, and natives of Rome, Naples, or Venice were eager to instance phrases for which the Florentine idiom had no equivalent, while Manzoni himself admitted that phrases unintelligible outside the walls of Florence could hardly form a part of the national language. The controversy is of course natural, and can only end when a living national literature comes to exist and to be read throughout the peninsula. The citizenship of Rome was lately offered to the aged patriot, and Milan regrets in him her most distinguished son.

## Art and Archaeology.

WILLIAM DAVIS.

WILLIAM DAVIS, who has just passed from among us—best remembered by his brother artists under the name of "Liverpool Davis,"—was a painter, though but slightly known to London exhibition-goers, of genuine and rare qualities, especially as a landscape colourist. This gift of colour was exemplified in Davis not by any seeking for opportunities of heaping up gorgeous tints, but by the singular truth and luminosity of his pictures. He was self-taught as a landscapist, and self-dependent. While a Turner, the great chief of the English landscape school, seemed to carry shut up in his paint-box the glories and beauties of each clime and country—he dealt out almost daily, fair weather or foul, with unerring hand and unhesitating memory, and would often compel nature into his mould, now sublime, now at times theatrical,—Davis on the other hand was little given to improving the *lines* of such compositions as nature set before him, and was absolutely indifferent to grandeur in the choice of his subjects. Out of the commonest fragments of scenery round Liverpool he would sometimes make his finest pictures. A mill with a snatch of distant blue horizon—some turkeys in the foreground—a tree—sheltered pond with ducks—oftener still a brown ploughed field with horses at work and some crows and an indigo distance,—these he would sit down to and study, time after time, till he had as it were imbued himself with their hues and textures, and would then go home and reproduce them with more marvellous fidelity than many who paint on the spot. But his skies—the skies which are the weak painter's bugbear—these were his triumphs, and made his pictures in this respect unique. From them the light would as it were radiate, and would seem to brighten the corner of the room where the work was hung. For this reason Davis in a gallery was always a dangerous neighbour; and despite his sometimes over-minute, sometimes slovenly execution, pictures placed next his would, however elegant in *line* or neat in handling, be apt to look heavy and pointy. Such simple subjects as his leave little for the pen to describe:

but among his more important works may be cited "The Mersey, from Runcorn," in the possession of Mr. Rae, of Birkenhead; "Ploughing," the property of Mr. Humphrey Roberts; "Harrowing," belonging to Mr. Albert Wood; "In Bute," in the collection of his old friend and early admirer Mr. John Miller; also a pair of pictures called "A Spring Torrent" and "An Autumn Flood," owned by Mr. Roberts; and such works as "The Young Trespassers," "Oxton Common," "The Old House at Hale," "Bidstone Mill," and "Summer Noon," in the collection of Mr. Rae. The picture which perhaps exhibits in the most remarkable degree the painter's versatility, as distinguished from his other merits, is a large-sized half-length of a peasant woman, belonging to Mr. Humphrey Roberts. In this powers of drawing the human figure—rare in landscape painters—are displayed. His horses are always excellent. Davis was born at Dublin in 1812, and died on the 22nd of April of angina pectoris. The last fatal attack was brought on, it is said, by seeing his two pictures badly hung at the present International Exhibition: not that it should be inferred from this painful occurrence that Mr. Davis was a particularly thin-skinned or self-asserting man; for the direct reverse is true, and no painter was more willing to work his steady and modest way on through the give and take of professional life. He was a devout though unostentatious Roman Catholic, and leaves a large family to deplore his loss.

W. M. ROSSETTI.

## EXHIBITION OF THE ARTISTS OF THE CONTINENTAL SCHOOLS.

AFTER the glare and excitement of the Academy exhibition it is refreshing to turn into the quiet little gallery in Pall Mall, where several of the well-known artists of the continental schools, and especially of the French school, have for many years been accustomed to display their works to their English admirers. This their twentieth annual exhibition, although it contains no great or striking picture, is distinguished by a larger proportion than usual of well conceived and well executed works. No pleasanter morning or afternoon can perhaps be spent among the picture shows now open in London than at the Pall Mall gallery. The sober tones that prevail here contrast pleasingly with the gaudy colours that fatigue the eye in most of our English exhibitions; and the true feeling for nature now visible in the works of so many continental landscape painters is what we were wont at one time to consider exclusively English. The French landscapists have undoubtedly learnt much from English ones, but in the present day they certainly seem to be outstripping their early teachers. When we find an Oak tree by Dupré realising 38,000 francs, a River Scene by the same 36,000 francs, a Frost Scene by Th. Rousseau 60,100 francs, and a Passage of the Ford by Troyon 62,000 francs—the prices reached at the sale of the Laurent-Richard collection—we begin to understand that the French landscape school has at all events achieved fame.

There are two pictures by J. Dupré in the French gallery—No. 19, "The Silvery Light of Early Morn," and No. 32, "The Golden Light of Eve." Both of these are charming in their effect, but in neither do we find the grand poetic conception of the "River Pastures" by the same artist mentioned in a previous number of the *Academy*, and now exhibited in Bond-street at the Society of French Artists. "The Dutch Fish Hawker," No. 45, by J. Israels, represents a woman with a baby in her arms and a basket of fish on her head wending her way through a wood. The subdued light of the wood or forest is admirably rendered. "Rustic Industry," 31, by Jules Breton, is another truthful and beautiful forest scene, wherein a girl stands knitting, leaning back against the trunk of one of the big trees. A sick child is brought to "La Sorcière Bretonne," No. 18, who with her finger pointed at it is using some charm or uttering some incantation for its recovery. Perhaps added to this she will also try the effect of some medicinal herb, for a pot is seething on the fire, no doubt containing some nasty compound. The faces of the Breton peasant and peasant women who have accompanied the poor mother to the sorceress are full of character and emotion. The scene is original and interesting, and is extremely well rendered. "Cherry Ripe," 22, and "Presents from Japan," 55, are in A. Stevens's usual style. They look as though they

were designed for illustrations for *Le Follet*, only the painting is so skilful and the details so carefully studied that one is obliged to consider them as works of art. J. E. Saintin emulates Stevens in giving us an utterly vacuous "Blonde en Bleu," 84, and a foolish picture of a languid fashionable lady at a glover's, 93. "A Peasant Girl of the Apennines," with chequered sunlight falling on her rags, 96, by Barilli, is a refreshing change after these vapid *Follet* pictures. We recognise the same ragged child in the other painting by Barilli, 130.

"Heemskerk and Barentz, the Arctic Explorers, making Plans for their Second Expedition to the North Pole (1595)," No. 131, is the title of an interesting picture by C. Bisschop, who gives us also in "The Sexton's Daughter," 86 (though why sexton's daughter it is difficult to say) the portrait of a sweet puritanical maiden whose side face we have the advantage of seeing in a looking-glass. She sits at a table surrounded by pewter and glass goblets.

"The Visit to the Taxidermist," 113, by N. Lagye, is a very clever picture in the style of Marks but without his humour. It represents a mediæval couple with their young son entering the shop of an old taxidermist, who stands at a long table surrounded by all sorts of queer birds and strange creatures. The subject is well composed and the painting most skilfully executed. Altogether the picture may well bear comparison with Marks' rendering of a similar subject in the Academy exhibition. "Shrimp Fishing—Early Morning—Dutch Coast," No. 153, is the most truthful and therefore most beautiful sea picture that we have seen for a long time. Only two fishermen and a boy and a girl wading in the low water with their nets on a grey misty morning, no effects of colour, no bright green sea, but just the grey scene itself transferred so truthfully to canvas that it is not robbed of any of its quiet beauty. "A Breton Peasant," 123, by Jules Breton, is one of those striking portraits that French artists often produce. It stands out in such bold relief from the canvas that at the other end of the room one might almost mistake it for a living being. The face is full of passion and seems to have a story behind it, but what it is we cannot read. The picture, we understand, forms a pendant to one now exhibiting in the Salon of a Breton woman performing penance.

Many other admirable and skilful pictures may be found in the French gallery. Indeed we find our catalogue perfectly scored with notes of admiration; but space will not permit of more being mentioned here, except the clever sketches by Meissonier, lent by M. F. Petit from his private collection. Most of these are exhibited in the upper room. They are merely little rough sketches, but show the true artistic skill.

M. M. HEATON.

#### NOTES ON ART.

It is strange that the sale of two genuine works by Raphael, one of them in tolerably good condition, should not have created more interest than did that of the Magliana frescoes at Paris a few weeks ago. These frescoes were painted for Leo X. to adorn the walls of the chapel of a favourite hunting-seat of his, called La Magliana, about six miles from Rome. In the seventeenth century the Popes appear to have given up hunting, or at all events to have deserted La Magliana, and it was made over to the Convent of St. Cecilia, of Trastevere. But the nuns of Trastevere had no use for the place, and therefore rented it to a farmer, without, it would seem, making any arrangement for the preservation of the frescoes. The farmer probably cared less for frescoes than for pigs, but he cared a great deal for his own dignity, and in order to avoid saying his prayers with his domestics he had a sort of tribune erected, to which he gained access by means of a door cut through the very centre of Raphael's "Martyrdom of St. Cecilia." Nothing indeed was left of this work but a few figures on either side, that were sold the other day to a Russian agent for 11,500 francs. The other fresco, however, as it did not interfere with the farmer's dignity or comfort, was suffered to remain, and by and bye the nuns of Trastevere, getting into difficulties, be-thought them of their neglected treasures at Magliana, and had them transferred to canvas, and then pledged them at the Monte di Pietà. Here they remained for about a year, when they were again removed to the Basilica of St. Cecilia in Trastevere. Finally, in 1869, they were bought by M. Oudry, who had them conveyed to France.

The principal of these frescoes, the only one indeed worth speaking of, for the St. Cecilia is a mere ruin, represents God the Father blessing the Earth.

This important work, the only fresco by Raphael out of Italy, was secured for the Louvre by M. Haro for 207,500 francs. It is not unreasonable to ask what the authorities of our National Gallery were about to let such a treasure escape them when it might have been secured for £8,500.

#### New Publications.

CHAMPOLLION. Notices descriptives des monuments de l'Égypte et de la Nubie, conformées aux manuscrits autographes rédigés sur les lieux par l'auteur. 14 Livr. Paris: Firmin Didot Frères.

#### Theology.

The Theology of the New Testament. [*Lehrbuch der biblischen Theologie des neuen Testaments.* Vol. Dr. Bernhard Weiss.] Berlin. 1873.

DR. WEISS's compendium, in this its second and enlarged edition, is a valuable contribution to the critical study of the New Testament. The author occupies a middle position between the extreme orthodox view which expects to find in the various writings of which the Bible is composed, no matter what their age or authorship, a complete agreement as to doctrinal truth, and the rationalistic criticism which regards those writings as entirely human in their origin, and declines to look beyond natural historical conditions to account for the peculiarities by which they are marked. The New Testament writings, he thinks, have a specific character which they could not have if the Christian life and consciousness had a purely human origin. This character depends on the fact that in the manifestation of Christ a perfect revelation of God was given; but inasmuch as the writings collected in the New Testament confessedly proceed from different authors, and belong to different times, a variety of religious ideas and doctrines may naturally be looked for. There is indeed such a thing as the unity of truth, which it is the province of Biblical dogmatic to bring to light; Biblical theology, on the other hand, has to do only with the variety of forms which are spread out along the course of historical development. Whatever be the defects of this hypothesis, at any rate it leaves the field open for a really scientific examination of the contents of the New Testament writings.

Dr. Weiss takes those writings as they stand, and states in a clear and succinct form, but with accompanying notes and explanations, what he considers to be the substance of their teachings on the various points of which they treat, neither endeavouring to explain away difficulties nor to torture their sense into agreement with any dogmatic system. That, indeed, he has never unintentionally permitted his hypothesis to modify his conclusions it might be too much to affirm, but we need not at least hesitate to accept his assurance that he is not conscious of having taken a single step in his inquiry under the influence of subjective feeling, or without confirming it by the minutest comparison of texts (*Preface to second edition*).

In the introduction to his work Dr. Weiss gives us an interesting sketch of the history of his science, together with a brief summary of the results of the labours of its principal representatives. The first part treats of the doctrine of Jesus according to the earliest tradition, and here—no doubt correctly—only the synoptical gospels are made use of, without however prejudicing the apostolic authorship of the fourth gospel, which in any case belongs to a more advanced stage in the development of the Christian consciousness. The primitive apostolic doctrine in the pre-Pauline period forms the subject of the second part; the third treats of the Pauline doctrine, the fourth of the primitive apostolic doctrine in the post-Pauline period, while a section on the Johannine theology completes the work. An obvious difficulty which this division suggests is the question whether we have in fact any writings earlier than Paul, or which can be regarded as altogether independent of his influence; and although it is possible to believe, without any recurrence to the documentary hypothesis, that the Petrine speeches in the Acts contain some authentic echoes of the earliest gospel, it is much more difficult to agree with Dr. Weiss that the epistle of James, with the well-known passage about faith and works, was written without any reference to Pauline teaching; while 1 Peter, which is put in the same category, looks the more doubtful just in proportion as reliance is placed in the Petrine speeches of the Acts. On the other hand, whether we admit with our author the genuineness of the epistles of the imprisonment or not, our judgment on that point will not affect our estimate of the value of his very full and generally satisfactory exposition of the Pauline system, inasmuch as those epistles are assigned a place by themselves, as belonging to a later stage in the apostle's life, and presenting a different phase of doctrine. The pastoral epistles are treated as Pauline, but not Paul's. To the post-Pauline period belong, of course, the epistle to the Hebrews, the Apocalypse, 2 Peter, and Jude, as well as the historical books; but in regard to the first of these writings the author seeks to reverse the received view, when, following Ritschl and Riehm, he pronounces it not a composition directly of the Pauline school, but a Jewish-Christian work with merely a Pauline colouring. The writer he thinks was a Hellenist, educated in a school in which the Alexandrine philosophy prevailed, but a disciple of the primitive apostles. He does not deny the influence of Alexandrinism on the form of his teaching, but will not permit us to turn to Philo for the genesis of his doctrine of Christ's person. But probably no one would think it necessary to assume any direct borrowing from Philo, and the admission of an influence, however indirect, implies all the difference between a truth directly revealed and an idea, which may be true or not, evolved in accordance with natural psychological law. If Dr. Weiss means that the view of Christ as the pre-existent Creator presented in the epistle to the Hebrews was revealed to the writer, that is an assumption which it would be impossible to prove; but in order to suppose that he would never have arrived at that

view if Philo had not preceded him it is not necessary that his doctrine and Philo's should be identical. One of the most valuable sections in the work is that on the Apocalypse, in which reason is shown for questioning the usual reference to the Nero legend in the allegory of the beast one of whose heads was wounded unto death, but whose deadly wound was healed. The beast is here the Roman Empire, which received a deadly wound by the death of Nero; but the healing of the wound refers not to any imagined return of Nero to life, but to the accession of Vespasian. The usual explanation would require not merely the healing of the wound, but the restoration of the head: is not this, however, demanding rather too much consistency in what purports to be a vision? As Dr. Weiss thinks that the Apocalypse is probably the work of the apostle John, and as he admits that its author was quite a different person from the author of the gospel and the epistles, it would naturally be supposed that he gave up the genuineness of the latter. This, however, he is not inclined to do. He supposes, in fact, that in the twenty years subsequent to the destruction of Jerusalem which he spent among the Greek Christians of Asia Minor the apostle *became* quite a different person, and while admitting that many enigmas would be solved by ascribing the gospel to the disciples of John rather than immediately to himself, he thinks that the testimony of the gospel itself compels him to hold to the direct apostolic authorship. Here again, as in the epistle to the Hebrews, the help of Philo is rejected, nor does the author desire to look beyond the Old Testament for an explanation of the peculiar theology of this gospel. The Logos of John is simply the Word of God of the Hebrew Psalms and Prophets, and if the manner in which the doctrine is stated seems to presume a certain familiarity with its terms on the part of the reader, the difficulty is explained by a reference to the oral teaching of the apostle. Surely, however, St. John, if he was the author, would have written with a view to readers who had not, rather than who had, enjoyed the benefit of his personal instructions.

It is not easy in a few sentences to give a fair idea of a book covering so great a range of subjects as this. Dr. Weiss's position of compromise between the orthodox and the purely naturalistic view seems to me untenable; but his work is learned, candid, and impartial, and will repay a careful study.

ROBERT B. DRUMMOND.

**A Critical Examination of the Life and Teachings of Mohammed.** By Syed Ameer Ali, Moulvi, M.A., LL.B., of the Inner Temple, Barrister-at-Law, &c. London: Williams and Norgate. 1873.

THIS book is a remarkable and welcome indication of the growing influence exercised by modern European ideas amongst certain circles of Indian Mohammedans. It is an apology for Islam; but from a rationalistic standing point. The author does not share the orthodox ideas respecting inspiration and miracles. He regards the Koran not as the word of God in the strict sense, but as the work of Mohammed, whom he reveres as the greatest and wisest of human teachers. One might almost say that he ranks the prophet, considered as a man, even higher than is usual amongst the orthodox. He is reluctant to admit that he was capable of a weak, much less a bad or inhuman action. With a skill which betrays the practised lawyer he softens or evades whatever is unfavourable to Mohammed in his authorities. We are far from wishing to ignore the great and noble features in this strangely composite character, but no unprejudiced student of the Koran, the ancient biographies, and the collections of traditions will be able to accept the author's general verdict. Much that strikes us disagreeably

in Mohammed admits of excuse if we take his age and circumstances into account; but the way in which he made the Koran subserve his private purposes even in such secular matters as the affairs of his harem; his many pious frauds; the severity which, although generally inclined to clemency, he exercised towards a few of his vanquished enemies, and many other traits, show him in an entirely different character from that of an enthusiastic philanthropist. The author is obliged to reject incidents, like the torturing of Kinâna (Ibn Hishâm, 763), which are given on good authority, without telling us who could have been either able or desirous to incorporate such discreditable untruths with the received tradition. It may be said too that Mohammed's ready reconciliation with many, especially of his own countrymen who were conquered without being truly converted, was more to his credit as a politician than as a prophet seeking only the things of God.

The enthusiastic picture of Islam which the author draws will scarcely tempt any of us to give our adhesion to a religion in which a series of, to use the mildest word, troublesome usages (circumcision, the five prayers with their strange gestures and attitudes, the Ramadhân fast, pilgrimage to Mecca, with the old, mostly heathen, ceremonies there, &c.) have always been recognized as holy and necessary, and are positively prescribed by the highest authority. The crude form of the doctrine of revelation, and the thoroughly human conception of the deity which only the most violent system of interpretation can eliminate from the Koran, would alone suffice to repel us. We can understand the powerful impression which the doctrine of retribution in the Koran would make upon an audience already in some measure predisposed to accept it; but it would leave us cold, or at most produce a slight impression, attractive or the reverse, upon our imagination. Islam, the grandly simple, severely one-sided development of Semitic religion, was certainly a blessing to many lands, especially to those with a Semitic population; but in spite of the author's able *plaidoyer* we should doubt much whether the partial advances to which it led in Persia and India could compensate for the serious evils which it brought upon those more richly endowed and finely organized nations. The author indeed takes much pains to represent Islam as the religion of humanity, but he cannot get rid of the fact that it bore from the beginning a character of violence and claimed the right to subdue everything by the sword, distinguishing all mankind into the three classes: enemies outside the pale of law, subject half-believers (Christians, Jews, &c.), and true believers. The latter, it is true, were regarded, according to the spirit of Islam and the will of its first leaders, as all possessed of equal rights, and the religion itself is not answerable for the pride of the Arabs which made them refuse, in the first centuries of Islam, to recognize this equality of rights in new converts of foreign nationality (cf. v. Kremer's *Culturgeschichtliche Streifzüge auf dem Gebiete des Islams*, Leipzig, 1873), and thus provoked the fierce hatred of the converted Persians, which manifested itself in the overthrow of the purely Arab dynasty of the Omayyads and other features of the Persian reaction. Islam, indeed, is not the only agent in the history of the Arabs and the other Islamite peoples, and we are not therefore entitled to give it credit, as the author is disposed to do, for all the bright sides of Arabian and Persian culture in the Middle Ages. The consideration of this Oriental culture shows on the contrary exactly what limits are imposed by Islam on the free development of the intelligence, and all historical facts must be disregarded before we can speak with the author of "the wonderful adaptability of the Islamic precepts for all ages and nations" (p. 187). While Christianity—from the

beginning no merely Semitic growth—showed an extraordinary capacity for development, so that there is an unbroken historical continuity between the modes of thought of the freest European thinkers and of the primitive Christians, the far simpler nature of Islam has never admitted of such transformation. It is pure self-deception when Ameer Ali with his humanitarian ideas considers himself as still a real Moslem. Islam seems to have passed through all the stages of internal development of which it was susceptible in the first centuries of its career. The intellectual freedom which is the vital atmosphere of modern progress has been won by an attachment, never quite interrupted, and reinvigorated by the Renaissance, to the principles of Greek culture. Of this Islam at its origin possessed nothing, and in later years comparatively little, and only as a superficial influence. Yet the author actually attempts to show that the Reformation was determined by Islamic influence! and it is evident that he is absolutely unable to appreciate the value of Greek culture, since he compares the age of Hârûn and Mâmûn with that of Perikles, and is indeed inclined to give the former the preference (p. 295). No one would demand a knowledge of classical antiquity from an educated Hindoo, but it would have been well if the author's English friends had been able to convince him that under the circumstances his judgment on such subjects had better have been reserved. When he reckons amongst the "three great evils which have befallen the human race," or the "three great disasters which have materially retarded the progress of the world and put the hour-hand of Time back for centuries" (p. 341 sq.), the failure of the Arabs to take Constantinople in the eighth century and the repulse of the Saracens by Charles Martel—we may differ from him, and yet allow that there is much to be said for his opinion; but when we find "the failure of the Persians in Greece" given as the first of these "disasters," what can we say? He argues indeed that "if the Persians had succeeded in bringing Greece within the circle of their dominions the influence of the Hellenic genius would have been far greater;" but this only shows more plainly that he has no conception of the nature of that Hellenic genius, which could only attain to its highest development in free Athens. This is confirmed by some of his expressions relating to Greek philosophy and other subjects. Ameer Ali has certainly read many European books (good and bad), but he should not have ventured, in reliance upon such erudition alone, to frame an original theory of the history of mankind; he was naturally not in a position to avoid all danger of oversights in great as well as trifling matters. Even as an historian he takes narrow standing ground, as the European reader may judge from the fact that in his preface he assigns "a place in the rank of the greatest historians of Europe" to Ibn al-Athîr, an excellent compiler, such as are not rare in Arabian literature. Less excusable than this weakness, in a learned Moslem writing upon Mohammed, is his insufficient knowledge of Arabic grammar, in proof of which it is only necessary to refer to the gross blunders with which the Arabic passage on p. 29 swarms.

One mistake, which the author shares with all Shiite and almost all Sunnite Moslems, is that of over-estimating Ali. A mystical obscurity early began to envelope the person of this gallant but incapable ruler, which, however, our authorities enable us to dissipate. We can confidently maintain that Ali, though the son-in-law and favourite of Mohammed, did not thence derive any right to the throne. The legitimist theory did not gain ground till later. We must even admit that in the rising against Othmân and his murder, Ali, as well as the two other pretenders, Talha and Zohair, played a very ambiguous part. No unprejudiced person can

doubt that the astute Mo'awiya was far better qualified to guide the mighty empire. The author, however, still places himself at a point of view unfavourable to the Omayyads. We by no means wish to imply that the frivolous Yezid I., who had not inherited the administrative wisdom of his father, was in any respect a model prince, but it is altogether unhistorical to place him, as the author does, on a level with Nero and Caligula because he caused his troops to suppress the mad insurrection of Hosain and to chastise the hypocritical inhabitants of the holy cities. The Arabs have really no reason to be ashamed of their thoroughly national royal house, to which the great princes Mo'awiya and Abdalmalik belonged; though the roots of their power did not, it is true, lie altogether in religion and consistent fidelity to the doctrines of the prophet whose successors they claimed to be. The men of powerful intelligence, in which the Mekka aristocracy was singularly rich, had for the most part opposed the prophet with all their strength, but as soon as his authority was established they placed themselves at the head of the further movement. We find Koraishites everywhere in command of armies and provinces, and the house of Omayya, which had fought most obstinately against Mohammed, soon obtained the throne. But the religious and historical tradition was mainly in the hands of the zealous adherents of the prophet, who were hostile to the dynasty by which they were kept in the background, and favourably disposed towards pretenders, especially those of Ali's house. As soon therefore as the Omayyads were overthrown the "learned" no longer had any motive for judging them favourably, and historians of the present day are consequently liable to be deceived by statements which have been coloured by party feeling. That our author is not entirely free from bias in judging this situation is only a fresh proof of the difficulty which even the most cultivated and intelligent inquirers find in freeing themselves from the misconceptions amongst which they have grown up.

Many other single points might be discussed, or we might dwell on the naïve style of historical criticism and interpretation of inconvenient passages, which remind us of the favourite procedures of the German rationalists of the beginning of the present century; but we have already exceeded our limits. In conclusion we would rather insist again on the pleasure with which we hail in the author a warm and sincere advocate of humane ideas. Though we cannot share his opinion that Mohammed's teaching agrees with the highest demands of humanity, it is eminently satisfactory that he should choose such a standard to test his religion by.

### Contents of the Journals.

**Theologisch Tijdschrift.** May.—Religion before the discovery of fire; by C. P. Tiele. [Partly a criticism of O. Caspari's *Die Urgeschichte der Menschheit*, u. s. w., a good book, which points out the right direction for future investigators, but suffers from oneness. The oldest form of religion must be reconstructed by abstraction from the later. We must first of all separate those parts of religion which have a relation solely to fire from those which may have belonged to an earlier period. If on historical investigation it appears that the latter are actually found among the least developed races, we may conjecture with great probability that they belonged to the primitive religion.]—Strauss and Christianity; by J. H. Scholten. [Appeared first in English in *The Theological Review*.]—Matthew Arnold; by L. W. E. Rauwenhoff. [Extracts from *Literature and Dogma*, with discriminating reflections. Was then, asks the reviewer, the revelation of Israel, even in its purest form, really so devoid of definite conceptions? Can the Bible as a whole be recommended as a "book of conduct"? Mr. Arnold's quotations are very limited in their range. The sixth chapter on "The New Testament Record" is one of the weakest in the book. What evidence is there that Jesus was absolutely free from the unsound fancies of his contemporaries? Is not Mr. Arnold unjust to the "Aryan genius" when he calls upon us to return to the religion of a nomade tribe of

Semites? Imitativeness is fatal in art; is it less fatal in religion? The main point of the book (too much neglected by the English reviewers) is the separation of religion from every form of dogma, even that of a personal God. Here the reviewer joins issue with the author. On the whole Mr. Arnold, for whom the reviewer betrays much sympathy shows a strong likeness to Rousseau in his independence of conventions and advocacy of a return to "nature."—Lagarde *On the Relation of the German State to Theology, Church, and Religion*; rev. by A. Kuenen. [A plea for "the Gospel" in opposition to "Christianity."]—Works of Finzi, De Gubernatis, Whitney, &c., noticed by Tiele; of Frankl. Grätz, Colenso, and Delitzsch, by Kuenen.

**Zeitschr. für wissenschaftl. Theologie.** Vol. xvi. No. 2.—Pauline researches; by A. Hilgenfeld. [Criticises 1. Lüdemann's *Anthropologie des Apostels Paulus* (very favourably), 2. Hirsch's essay on the Epistle to the Philippians in the *Zeitschrift*, and 3. Holtzmann's *Kritik der Epheser und Kolosserbriefe*, which has entirely failed to convince the reviewer.]—Exegetical studies on the New Testament; by E. Harmsen.—Philo and the received text of the LXX; by C. Siegfried.—The ostrich in Job xxxix. 13-17; by Dr. Egli.—Epigraphic contributions to the history of the Herodian family; by E. Schürer.—Xenola theologica; by H. Rönsch.—The letter to Diognetos; by A. Hilgenfeld. [Adverse criticism of Overbeck's view placing this letter in the age posterior to Constantine.]—Notices of books: On Dicstel's edition of Knobel's *Isaiah* (favourable), and Grätz' *Song of Songs* (adverse); by Egli. On Schrader's *Die Keilinschriften u. das A. T.*; by Siegfried. On Weiss' *Biblical Theology of the N. T.*; by A. H. On Tischendorf's (new and cheaper) edition of *Clementis Romani epistulae*; by A. H. [Cf. Lipsius in *Academy*, vol. i., p. 255 sq. In some cases Tischendorf accepts Lightfoot's view of the reading in Cod. B.; in others, and even in I. 24, he defends his own view; the commentary presents little that is new.]—Miscellaneous: Explanation of the inscription published by Schlottmann as Moabitish in the *Z. D. M. G.* xxvi. 411; by Hitzig.

### Science.

**The Expression of the Emotions in Man and Animals.** By Charles Darwin. London: John Murray.

THE publication of a new work from Mr. Darwin's pen is an event of scientific as well as of public importance, and in this double aspect it becomes a task as difficult as responsible to prepare a notice of such a book. As regards the scientific questions the reviewer is placed at a disadvantage: whatever his knowledge and acquaintance with the subject may be, he may be certain that it will not suffice for the task, for Mr. Darwin has the peculiarity of opening up in each of his books new fields, where critics may perhaps find themselves impelled on less important points to controvert this or that opinion of the author, but where in general they share the position of other readers in sitting silent to learn.

If however we do not altogether refrain from discussing the new book lying before us, our main object is to give our readers an idea of the fresh fields explored by the great naturalist.

How often it has been stated that among the chief privileges of man as contrasted with the lower animals is the great gift of physiognomical expression—a gift which seemed all the more peculiarly human as it became obvious

that other animals, being destitute of the innumerable emotions of man, could not present traces of the innumerable expressions dependent on these emotions. The belief in this elementary constitution of man's nature was so great at one period that physiognomy came to be regarded as a science as important and conclusive as astrology had been in the Middle Ages; and the more hidden the actual connection between mind and body in this case, the more one pretended to intuitive knowledge about it, the more one shrank from subjecting the great achievements of which some profound physiognomists boasted to a critical examination. When we remember how Lavater spent a great part of his life in the study of physiognomy, and recall how Goethe entered into correspondence with him on the subject and sent him portraits and silhouettes, can we wonder that the great mass of the people held a belief in the most direct connection of character and mind with the expression of the face? Goethe, it is true, was not an absolute believer in the art of judging of the inside of a man by looking at his outside, for he wrote on one occasion to Lavater: "Seitdem ich keine physiognomische Praetension mehr mache, wird mein Sinn sehr scharf und lieblich, ich weiss fast in der ersten Minute wie ich mit den Leuten dran bin;" he nevertheless occupied himself in thinking over the principles of this so-called science.

Mr. Darwin himself, in the Introduction of his work, gives us a short review of what has been done in physiognomy by treatment with the scientific method. For it is not altogether nonsense—as little in fact as astronomy is nonsense, because people at one time believed in astrology. From M. Moreau, who held that the *corrugatores supercilii* from their attachment and position are fitted "à resserrer, à concentrer les principaux traits de la face, comme il convient dans toutes ces passions vraiment oppressives ou profondes, dans ces affections dont le sentiment semble porter l'organisation à revenir sur elle-même, à se contracter et à s'amoinrir, comme pour offrir moins de prise et de surface à des impressions redoutables ou importunes,"—to Messrs. Bain, and Herbert Spencer, and especially Sir Charles Bell, Mr. Darwin traces in a slight sketch the development of physiognomical investigation and philosophy.

It is not so much physiognomy, however, that constitutes the main subject of interest in the new book as the Darwinian theory which lies before us in a new guise where we would scarcely expect to meet it. Mr. Darwin has in fact fulfilled a promise given in the preface of the *Descent of Man*, of which work it forms a part and may be considered the third volume.

It is not the anatomy nor indeed can it be called the physiology of expression of which Mr. Darwin treats. His object is rather to trace its origin in the ancestors of man, and to give an exposition of the principles involved in the different modes of expression in man as well as in other animals.

Mr. Darwin is always bound to face a considerable difficulty in all that he writes. Having originated the doctrine of Natural Selection, it falls to his lot more than to anyone else to show the universal application of this principle in all forms of organic life. In truth, there is no one who has done so much to search out the hidden corners where the action of Natural Selection is to be recognised, and where this principle alone gives a satisfactory explanation of problems hitherto unsolved.

Writers in the *Revue des deux Mondes* and other journals and books may use every effort to convince their readers that the theory of descent is not Mr. Darwin's great achievement, but is due chiefly to Lamarck and others; it nevertheless remains a simple truth that Mr. Darwin's elucidation of the

actual influence of Natural Selection throughout the whole organic world has been the means of overthrowing the old doctrines of separate Creation—still held by some naturalists even of high rank, and believed in by all those who cling to old traditional beliefs rather than to new scientific doctrines, for the simple reason that they believe all human knowledge to be vanity, and as a consequence prefer ignorance to inquiry.

Though Mr. Darwin not only originated the doctrine of Natural Selection as the chief principle ruling the development of the organic world, but is also its chief supporter and expounder, he nevertheless holds that Natural Selection in the strictest sense does not afford a universal explanation of all the phenomena of organic life, past, present, and future. The theory of Sexual Selection, for example, was proposed to meet the difficulty. When endeavouring to explain all the facts by Natural Selection Mr. Darwin perceived that changes in organisms occurred which were clearly not dictated by the simple action of this great principle, but by some other and minor one, which he termed the principle of Sexual Selection. The acceptance of this principle has met with considerable resistance from a good many naturalists, and even many evolutionists, who, seeing in it, we believe wrongly, an abandonment of the theory of Natural Selection, make war against their own leader. Perhaps these same gentlemen will not be entirely satisfied when they examine the three principles to which Mr. Darwin reduces all the modes of expression of emotion in man and animals. For if everything that happens is only to be tried by the test of its survival on account of its usefulness in the struggle for existence (which would bring it within the domain of Natural Selection) it may appear as if the three principles of expression do not come within the range of the discussion.

The first of these principles is that movements which are serviceable in gratifying a desire, or in relieving a sensation, if often repeated become so habitual that they are performed, whether they are of any service or not, whenever the same desire or sensation is felt even in a very slight degree.

The three principles with the many instances by which they are illustrated in Mr. Darwin's book are of interest not only as teaching physiognomy, but, as we have already indicated, in attempting to introduce the theory of Evolution into our knowledge of the functions of man and other animals. To take an example: if we consider how a person uncovers his canine teeth in expressing defiance or contempt the action would be explained by all those who are not Evolutionists by an endeavour to show the direct influence of scorn or defiance on the muscles that execute this movement. It would be difficult to find a satisfactory explanation of such uncovering of the canine teeth in a sneer. One could hardly understand why contempt or defiance is more nearly related to uncovering the canine than other teeth, why in short it has anything whatever to do with teeth. Mr. Darwin, however, on seeking out the origin of such action finds it in another function that belonged to the ancestors of man—to the lower animals, in which showing the teeth, and especially the canine teeth, denoted readiness to bite and fight. Man as a rule no longer bites his enemies, yet the uncovering of the canine teeth in a sneer is still a very usual function to express indignation, contempt, defiance, or scorn. That this should ever happen in man is only to be understood by his relationship to the lower animals, and thus a special physiognomical function of man is derived from another more or less defensive function of those animals.

A similar movement, and one only to be interpreted by similar reasoning, is the protrusion of the lips in anger and

scorn: in itself it is useless and would have no meaning, but viewed as an offspring of animal function it is clearly understood. A great number of other instances of a like kind might be quoted from Mr. Darwin's book.

Regarded from a biological point of view this book derives its chief interest from being a successful attempt to trace the origin of special functions, to introduce the theory of Evolution into the domain of physiology.

Here it seems we do meet with an element not strictly an essential constituent of the theory of Natural Selection, for as Natural Selection tends to preserve only what is useful and serviceable for the struggle of existence, movements that are not actually beneficial ought not to be retained.

The second principle is that of antithesis. The habit of voluntarily performing opposite movements under opposite impulses has become so firmly established in us by the practice of our whole lives that if certain actions have been regularly performed in accordance with the first principle under a certain frame of mind there will be a strong and involuntary tendency to perform directly opposite actions, whether these are of any use or not, under the excitement of an opposite frame of mind.

This principle points still more directly to a hidden root whence actions spring. The former leads us to look for an origin of animal action that is not to be found in direct usefulness alone, while the movements which Mr. Darwin classes under the principle of Antithesis seem, to judge by the examples and illustrations he gives, often to be quite superfluous and without the slightest direct bearing.

Lastly, the third principle is the direct action of the excited nervous system on the body independently of the will and independently to a great extent of habit. The direction which this nerve-force follows is necessarily determined by the lines of connection between the nerve-cells with each other and with various parts of the body. But the direction is likewise in a large degree influenced by habit, inasmuch as nerve-force passes readily along accustomed channels.

The origin of functions is a question as yet almost wholly untouched. The discussion of this strange subject leads us of necessity to another of an equally remarkable nature, namely, the active and passive resistance which the theory of Descent finds in more than one physiological school.

In earlier years, when physiology existed almost everywhere in, so to speak, personal union with anatomy, the dislike felt by physiologists for abstract morphology was less marked. Though physiology was always regarded as the cardinal science in relation to the great problem of life, it did not altogether disregard the aid of anatomy and morphology in working out solutions of special physiological problems. The labours of a man like Johannes Müller alone suffice to prove this, and his handbook of physiology teaches on almost every page the important influence of morphological views on physiological research. If we extend our gaze still farther back we find this striking feature of a combination of scientific physiology, anatomy, and morphology becoming more strongly apparent.

After Johannes Müller, however, and as soon as the great break happened about the theory of Vitalism, especially after the publication of Du Bois-Reymond's great work on *Thierische Electricität*, physiologists in general got rather out of the habit of carefully studying anatomical or morphological problems, while in some quarters there sprang up the idea that morphology was not so much a science as an excellent pursuit for amateurs—a more or less innocent amusement to which one might devote one's attention if one chose, but which would exercise no influence on the general march of human ideas, and through a want of method

and exactness could scarcely be termed a science. Exactness came to be identified with experimental research, and physiological laboratories provided with complex apparatus and frogs, rabbits, and dogs and other animals, were considered the chief tribunal, before which life was challenged to confess its latest secrets.

There can be no question that this line of physiological research derived great advantage from the application of physics to the consideration of physiological questions. Thus the physiology of the senses and nerves attained to a wonderfully high degree of true exactness. It is perhaps due to these very results that at the time when the methods of experimental physiology were held in such respect the microscope and microscopists were a little too lightly regarded—a feeling which culminated in the dictum that a microscopical discovery scarcely lasted longer than five years. It must be admitted that at the very period of the highest development of experimental research in physiology morphology laboured under a temporary want of new ideas. The struggle against the overwhelming influence of speculation in the beginning of this century had ended in the other extreme, in an accumulation of mere facts. The want of ideas was necessarily followed by the absence of criticism, and thus morphology and zoology resembled in some respects a dictionary containing all the words necessary for the construction of a thoroughly philosophical book, but which is not the book itself.

Mr. Darwin came, and the book was written. By it morphology became burdened with important questions, the answers to which have not only a bearing on morphology itself, but extend its boundaries into fields where it touches on one of the most fundamental questions by which the human mind ever has been or can be agitated. The *Origin of Species* led to investigations concerning the origin of innumerable other things, the beginnings of which had hitherto lain in utter darkness and were believed hidden once and for ever. The theory of Evolution began to affect with its principles and methods nearly every department of human thought, but the stronghold from which it derived its methodical power was and is morphology.

Thus of a sudden the sister sciences physiology and morphology became once more of equal importance, and one might perhaps say that at present morphology has just claims to be held the greater. Such a claim however would be vain and useless, for it is impossible that physiology should any longer delay to adopt with equal energy the methods and principles of the theory of Evolution, and by so doing range itself once more close beside morphology—nay, and embrace so entirely the doctrine of Evolution that a break between physiology and morphology, such as has existed during the last twenty or thirty years, will be rendered impossible in future.

And it cannot be questioned that the new task of physiology will be to investigate the origin of functions. If it be true that all organisms now living are the descendants of former living ones, and that these former living ones possessed simpler characters, this of course will hold good equally in respect to their functions, and it becomes necessary to trace not only the change and differentiation of the organs, but also those of the functions. To do this effectually physiology must not restrict its investigations to frogs, rabbits, and dogs, but extend them over the whole animal kingdom. And in doing so it will at once find how powerful an aid morphology is, how indispensable and how ready to help its sister science, and how rich in questions which on its part it is unable to solve except by alliance with comparative physiology.

This is a powerful reason for congratulating ourselves on

the appearance of Mr. Darwin's new book. It not only gives rules and principles to physiognomy, connecting by new ties man and his mental world to animal life and its bodily constitution, but traces a new and highly important line of inquiry with respect to the origin of functions. In showing how in many cases the function of expressing emotions has its origin in other functions, he has led us to that immense and almost endless path which physiology must traverse in respect to all and every function in order to attain that point where life itself becomes but a function of matter, a part of which Spinoza determined when he said, "Cujus essentia est existentia."

ANTON DOHRN.

### Notes on Scientific Work.

#### Geology.

**New Tertiary Mammals.**—Prof. O. C. Marsh describes some new species and a new genus (*Coloniceras*) of mammals from the tertiaries of the Rocky Mountains, examples of which are deposited in the museum of Yale College. A study of additional specimens of *Orohippus* has led to its separation from *Anchitherium* and shows it to hold an intermediate position between that genus and *Palaeotherium*. *O. agilis* possesses four functional digits in the manus. The first premolar is nearly as large as the second, and an antorbital fossa is absent. The skull is elongated and equine in its proportions. The orbit is not enclosed behind. There are three upper true molars and four premolars. The radius and ulna are separate. This species differs from *O. pumilus* in having the inner cones of the upper molars more nearly of equal size, each exhibiting a distinct basal ridge. The animal was nearly as large as a fox. The new genus *Coloniceras* differs from *Hyrachyus* and *Halalides*, so far as they are yet known, in possessing a pair of dermal horns on the nasal bones, which are placed opposite each other. In *C. agrestis*, which was about as large as a sheep, the horns are widely divergent. *Dinoceras lucaris* has the inner posterior tubercle of the penultimate molar double; the last true molar has a tubercle in the angle of the transverse crests, and is also wanting in the second posterior tubercle. The basal ridge is continuous on the inner side of each of the three upper premolars. This as well as the foregoing species are from the Eocene of Wyoming. *Oreodon occidentalis*, which occurs in the Miocene of Oregon, resembles *O. Culbertsoni* in most of its cranial characters, but differs materially in the large auditory bulla, which is several times the size of the postglenoid process. It is smaller than *O. major* and has the frontals between the orbits more depressed and the antorbital fossa deeper. *Rhinoceros amnecens* was apparently about half the bulk of *R. pacificus*, but resembles it in some of its dental characters. In the upper molars, however, the transverse crests approach each other much more nearly, while in the true molars they are united. The basal ridge is also much less developed on the inner side of the upper molars. Upper incisors are present, one of the lateral ones being much depressed and its crown very short, as in the existing *R. javanicus*. This species is likewise from the Oregon Miocene. Another new species of this genus *R. Oregonensis*, much larger than those of the Miocene, occurs in the Pliocene deposits of Oregon. One of the specimens found is a penultimate upper molar which differs widely from the corresponding tooth of any of the known species. At the union of the transverse posterior ridge with the outer cusp there is a deep cavity, nearly circular, and enclosed by a vertical cylinder of enamel. The anterior crest also is divided, a strong branch being sent inwards and backwards from the posterior side into the main transverse valley. (*Amer. Jour. of Science*, May, 1873, 407.)

**A Bird from the Rupellan Clay.**—M. P. J. Van Beneden has examined (*Bulletin Acad. Roy. des Sciences*, 1873, No. 4, p. 354) the fossil remains of a bird from the Rupellan clay of the Waes country, sent to the Belgian Academy of Sciences by Dr. Van Raemdonck. They consist of a complete sternum, the greater part of the cranium with some of the face bones, fragments of lower maxillary, an entire clavicle, one complete humerus, two coracoids, two radii and ulnae, one scapula, one tibia, a phalanx, and two tarso-metatarsals. These are all well preserved, and possess the peculiar tint of all fossils from this clay. M. Gaudry finds them to belong to an individual of the species *Anas marila*, generally known by the name of *Milovinan*, which still lives in the Arctic regions, and visits some parts of Europe during the autumn and winter months. It is the only known living representative of the birds of early tertiary times.

**Discovery of a New Human Skeleton of the Palaeolithic Epoch in Italy.**—M. E. Rivière describes (*Comptes Rendus*, 1873, Part 16, 1027) the remains of a second fossil human skeleton from the sixth cave

of Baoussé—Roussé (Grottes de Menton), Italy. The skeleton was found at a depth of nearly four metres below the floor of the cave lying extended on its back in the longitudinal direction of the cave. The deposit forming the floor is regularly stratified, and consists of charcoal, ashes, of small calcined angular stones, bones and teeth of animals, shells, and flints. Associated with the remains were numerous flint implements and a few worked in bone, as well as a number of perforated shells belonging to the genera *Nassa*, *Buccinum*, *Cypraea*, &c.; these, from their position, had evidently formed parts of a necklace and bracelets, and were interred with the body. The extreme friability of the bones did not allow of their removal in so perfect a condition as that of the first skeleton, but, in this case also, they belonged to a tall individual, the skeleton measuring nearly two metres in length. In the debris of the cave bones of the following animals were met with:—*Ursus spelaeus*, *Hyaena spelaea*, *Canis lupus* and *vulpes*, *Arctomys primigenia*, *Lepus cuniculus*, *Mus*, *Equus caballus*, *Sus scrofa*, *Bos primigenius*, *Cervus Canadensis*, *Elaphus corsicus* and *capreolus*, and *Capra primigenia*. Besides there were found some bones of a large eagle and some birds of passage, as well as numerous species of marine shells of the genera *Patella*, *Pectunculus*, *Mytilus*, *Pecten*, *Dentalium*, and *Trochus*.

**The Geology of Mount Léberon, Vaucluse.**—M. A. Gaudry contributes to the French Academy of Sciences some details of the geology of Mount Léberon. The mass of the mount consists of lower cretaceous rocks, as indicated in the geological chart of MM. Dufrenoy and Élie de Beaumont, with the middle tertiary covering its southern slope but not reaching its summit. Between Cucuron and Cabrières d'Aigues the lower tertiary consists of molasse, the lower beds of which are grey and yield very few fossils, the upper being yellow and containing principally *Janira planosulcata*, *Pecten scabrusculus* and *Ostraea Boblayei*; these appear to represent the horizon of the faluns of Bordeaux and Touraine. At Camille-Jean, near Cabrières d'Aigues, occurs a bluish-grey sandy marl yielding several species of marine shells in good preservation, many being quite new; they belong to the highest horizon of the falunian. The beds at Cabrières enclose bands of pebbles with broken shells, indicating a beach deposit. There are moreover beds of a light-grey colour which enclose *Ostraea crassissima* in little groups of four or five individuals. The marine beds are covered with a thick layer of marly limestone which appears to have been formed in bogs; it bears *Helix Christolii*, and many other species of bog shells. The upper part passes into a reddish loam in which are embedded remains of *Hipparion*, *Rhinoceros*, *Gazelles*, &c. M. Gaudry remarks that the comparison of the mammifer remains of the upper and the marine mollusca of the lower beds tends to confirm the observations made by Darwin, Lyell, and himself in other parts of the globe, that the higher organised animals existing at a period nearer to our own are much more changed than the lower forms of an older date. MM. Fischer and Tournouër find amongst the molluscs fifteen species identical, or nearly identical, with those now living, while all the mammifers on the contrary are quite distinct from the present species, and belong to the genera *Machairodus*, *Ichtherium*, *Dainotherium*, *Hipparion*, *Acerotherium* (?), *Helladotherium*, and *Tragoceros*. Like the fauna of Pikermi in Greece, Balthazar in Hungary, and Concu in Spain, those of the red loam of Mount Léberon appear to belong to the late Miocene or tortonian epoch. M. Gaudry believes that he has been able to distinguish seventeen successive fauna in the tertiary epoch. (*Comptes Rendus*, 1873, Part 17, p. 1096.)

#### Physiology.

**Mechanics of the Secretion of Bile.**—At the meeting of the Medical Society of Vienna held on the 28th of March Professor Stricker communicated the results of an investigation undertaken in his laboratory by himself in conjunction with Dr. Röhrig with the object of determining the relation of the secretion of bile to the amount of blood contained in the abdominal viscera. This inquiry he remarked had already been taken up by Schmuljevics and Ludwig, who had observed that bile continued to be secreted when blood was injected into the excised liver. Röhrig repeated and corroborated this result, though the quantity of bile he obtained was very small. It was a question therefore whether the bile thus excreted is actually the result of the secretory activity of the liver or whether it is merely mechanically expelled from the organ in consequence of the distension of the blood-vessels. The question was decided by the injection of water or dilute solution of common salt, when it was found that no bile was secreted. In Stricker and Röhrig's experiments it was considered at the outset a matter of importance to determine whether, as Pflüger and Hering maintain, the nerve-fibres pass directly to the hepatic gland cells, in which case they would constitute the chief factors in the production of the biliary secretion, while, if these do not, the secretion must be directly dependent on the blood. As regards the rapidity with which the secretion is eliminated the means hitherto adopted for its determination have not proved very satisfactory. The introduction of a tube into the ductus choledochus is a defective method, for the pressure in the biliary ducts is very small, and a slight deviation of the tube from a horizontal position may produce considerable

differences in the result, more bile flowing when the tube is directed downwards, less when it is inclined upwards. Stricker and Röhrig endeavoured to improve upon this method. They experimented on curarized animals, and introduced a canula into the ductus choledochus to which a flexible caoutchouc tube was attached, the latter ending in an outflow tube that was kept in position by a vice. The quantity and rapidity of the secretion was then determined by the metronome. In these experiments they noticed : 1. That in fasting animals the secretion of bile is checked, while it is increased after feeding. 2. That the introduction of water into the stomach or intestines somewhat increases the secretion of bile, but has no permanent influence upon it. 3. That the administration of purgatives, such as croton oil, colocynth, rhubarb, aloes, jalap, calomel, Epsom salt, &c., unquestionably increases the secretion of bile. 4. That ligature of the vena portae and hepatica immediately stops the secretion. Ligature of the vena hepatica materially diminishes the secretion. 5. That ligature of the aorta at the diaphragm materially diminishes secretion, but does not entirely arrest it. Ligature below the origin of the coeliac artery immediately causes increased secretion. Ligature of the vena cava ascendens causes immediate stoppage of the secretion. It appears from this that hyperaemia causes increase, anaemia decrease in the amount of secretion formed. Moreover all those agents which induce contraction of the vessels bring about a marked diminution of the biliary secretion : when for example an exposed nerve is excited, or the spinal cord divided from the brain, injection of strychnia leads to the same result, and the same is true of various remedies ; those that produce hyperaemia increase, those which cause anaemia diminish the biliary secretion. (*All. Wien. Zeit.*, 14, 1873.)

**Anaesthesia by Cold.**—That intense pain is produced by immersing the hand in cold water is well known. Horvath in a recent number of the *Centralblatt* (No. 14, 1873) states that during some experiments on the effect of cold on frogs he accidentally discovered that the immersion of the finger in alcohol at a temperature of 25° F. produces no pain. Glycerine in its action resembles alcohol, while ether comports itself like water, and in quicksilver the pain is even more intense. When the finger is in cold alcohol slight contact with another body is distinctly experienced, but pricking in a degree to produce pain in other fingers is not felt. Tactile perception therefore remains, though sensations of pain and cold are not experienced. Struck with this observation Horvath proceeded to make a practical application of the fact in cases of wounds and burns, and found not only that the pain immediately ceased when the burnt part was immersed in alcohol, but that the subsequent progress of the case was greatly benefited. He considers that if the opinion be well founded that in extensive burns the fatal termination is caused by the pain being continuous, the removal of such pain may be accomplished with advantage by the application of cold alcohol. He is also of opinion that by this means traumatic tetanus may be prevented.

### Botany.

**Protection of Pollen against Premature Displacement and Moisture.**—Dr. A. Kerner reprints from the *Proceedings of the Medical and Scientific Society of Innsbruck* an interesting memoir on this subject. Pollen is of two kinds, powdery and coherent. The former kind is found almost exclusively in those plants whose fertilization is effected by the agency of the wind. The quantity of pollen is in these cases enormous ; the anthers are frequently attached very slightly to the end of elongated filaments, so that the pollen is shaken out of them by the least breath of wind ; the flowers grow on the most exposed parts of the plant, frequently appearing before the leaves, so as to give greater facility for the dispersion of the pollen, and are not provided with brightly coloured corolla, powerful scent, or nectar, for the purpose of attracting insects. Plants, on the other hand, whose pollen is coherent, are dependent on insect agency for its dispersion and transport to the stigma. It is therefore absolutely essential in these cases that some means should be provided for its protection from moisture, whether rain or dew, which would immediately destroy its efficacy, until such time as it may be carried away by insects. A variety of contrivances are actually found in nature for effecting this end, which may be classified under the following heads :—1. Protection by portions of the pistil or stamens themselves, as in the petaloid stigmas of *Iris*. 2. By portions of the calyx and corolla ; this occurs in an immense variety of forms. 3. By sheaths, bracts, or foliage-leaves. 4. By periodic movements of the leaves of the perianth, as in the closing of flowers at night or in rainy weather. 5. By curvature of the axis, as in those numerous flowers the opening of which is always turned towards the ground at the period when fertilization takes place. From the examples adduced Kerner draws the general conclusion that the protection of the pollen against the injurious effect of premature moisture is the more perfect the smaller the number of flowers and of pollen-grains in the individual, the greater their degree of coherence, and the more exclusively the flower is fertilized by insect agency. In those plants where the flowering extends over a great space of time, where the anthers in the same flower vary in the period of the debiscence to allow the

escape of the pollen, and where the number of flowers in an inflorescence is very large, the protection of the pollen against the influence of the weather is reduced to a minimum, as in Umbelliferae and many species of Cruciferae and Saxifraga. When some of the anthers are placed in such a position that they are necessarily exposed to the weather, or that any protection would interfere with the ingress of insects, we find these anthers commonly suppressed, or, if present, destitute of pollen, as in *Maranta* and *Zingiber*. Finally Kerner draws the conclusion that those plants whose coherent pollen renders insect agency necessary for their fertilization can only have existed in very recent geological periods ; and those new species or varieties must necessarily have the advantage, and tend to become perpetuated, which possess superior advantages, in respect to the climate in which they grow, for the protection of their pollen from all injurious influences. The plants the remains of which are found in the oldest geological formations are generally of that class which do not require insect agency for their fertilization.

### History.

**The Paston Letters.** Vol. I. Edited by James Gairdner. (Arber's Series.)

HAD not Mr. Herman Merivale attacked the genuineness of the Paston letters it is probable that we should have had to wait for many years before we could possess ourselves of a well edited edition of what is on the whole one of the

most important links in the chain of our domestic history. Antiquaries and some few scholars had read the book, and manufacturers of popular histories sometimes quoted it; but we imagine that in the great outer world of readers there were but few who had anything better than a second-hand acquaintance with the Pastons before the question of the authenticity of their correspondence was discussed in the *Fortnightly Review* for 1865.

To anyone who had a really familiar knowledge of the thoughts of the time in which these letters were written, and of the manner in which thoughts then were wont to crystallize into homely speech, there could be no reasonable doubt that the Paston letters were what they professed to be, but on the surface the question presented many difficulties. The original manuscripts were not forthcoming, and no very satisfactory account of them was to be had, and then there were scattered up and down, sparingly it is true, but still in sufficient numbers to be very startling, colloquialisms which it has been the custom to believe of a much more modern date. It is certainly strange to meet with a knight of the fifteenth century talking about certain fighting men in Caistor Castle as "*gentlemanly*, comfortable fellows;" and we are troubled by a sense of modernness when we hear it said of a certain lady that "Her dwelling is in London, but her mother and she came to a *place of hers*, five miles from Eton." The fact is our knowledge of past times is almost solely derived from carefully prepared literature. We have almost nothing on which literary art has not spent itself more or less in lopping and pruning. In former days, as now, common colloquial expressions or new phrases and turns of speech were jealously eyed by those engaged in book manufacture. As the correspondence of Walpole, Wilberforce, or Hannah More does not represent the common talk of their age, but only such a strained decoction of it as they thought would look seemly on paper, so even our highest and best literature does not give us a complete picture of the way men spoke when it was written, but only certain selected characteristic words and phrases carefully mounted and set among much that we may be quite sure could never have been spoken exactly in the way we have it. How needful it is to use the utmost caution before we reject anything as spurious on the ground that it contains expressions we have been accustomed to attribute to a modern period one example will suffice to prove.

If there be a single word that it would have seemed quite safe to take as a test it is that ugly bastard *reliable*. Purists are never weary of denouncing it, and though good writers and bad are now accustomed to use it no one does so, we imagine, without a certain sense of shame. It is, we are confidently told, mere "bagman's English," manufactured in the Victorian era not because it was wanted, but simply because it sounded somewhat finer than an old servant like trustworthy. So strong is the conviction in men's minds that here we have an undoubted interloper, that few of us would wish to encounter the ridicule that would follow should we publish a letter which professed itself to be a couple of centuries old in which the offending word occurred, unless we could produce the most overwhelming proofs of its genuineness. Yet that this ugly, ill-formed word was in use more than two hundred years ago is quite certain, for Richard Montagu, writing to John Cousin in 1624, says quite naturally of two friends of his who were but newly dead, "I knowe not two honester, abler men, and *reliable* indeed of their ranke and state" (*Corresp. of John Cousin*, i., 34, *Surtees Soc.*)

There can be no doubt that the English of the fifteenth century was a much freer and more elastic speech than most of us have been in the habit of thinking it, and apart from all historical and strictly philological considerations we must

regard the Paston letters as most valuable literary treasures because they teach us this. We are too apt to think that a time that has few books can have little culture, and it is a great service to us when evidence is produced which refutes so illiterate a conjecture.

As contributions to history proper the *Paston Letters* are not of extreme value. They confirm in many minute particulars statements which we have on other authority, but they do not give us much that is new. It was not to be hoped for. The private correspondence of no family, except perhaps one of the very highest, would be likely to contain secret state papers, and of that which was not secret we have already sufficient proof. The war of the Roses is a dark period not because we do not know when this or that battle took place, or who were the combatants, but because the motives which influenced action are mostly unknown to us. As a commentary on national motives these letters are instructive. The writers naturally do not preach or philosophize; but there is an undercurrent in their writing which shows how widely different an Englishman's thoughts were then to what they had become after the Tudor tyranny had consolidated the national character. No craving after liberty appears here; unjust charges are grumbled at, and the working of the law generally not considered admirable; but the complaints are such as we now make of the weather, not such as we address against an unpopular government. The idea of the divine right of kings was not understood then, but the divine right of rule, good or bad, seemed to be acquiesced in, not so much because it was divine as because there was no hope of making things better.

Of the way in which these letters are edited little need be said. Whatever appeared in the former editions is given or will be given here, with large additions from documents discovered soon after Mr. Merivale's article attracted attention to the Correspondence. All that has been before published is again reproduced in full. The new matter when important is put before the reader in full also; when of less value it is calendared after the manner followed by the Public Record-keepers.

Most praiseworthy care has been taken by the editor to arrange the documents according to their true chronology. For this labour very great credit is due, for it is a most tedious business, and beset with pitfalls at every step.

The long introduction is a careful synopsis of the history of the time, commendably free from speculations not based on record evidence, and quite free from those silly attempts at poetry and picturesqueness by which certain writers on historical subjects have spoiled their narratives and misled their readers.

EDWARD PEACOCK.

### Notes and Intelligence.

The eighth number of Dr. von Spruner's *Historical Atlas* for the middle and modern ages, re-edited by Dr. Theodor Menke, has been recently issued, and contains as usual four sheets. The leaves 46 to 49 refer exclusively to German history from the days of Frederic the Great to the present time. Nothing can be more instructive than a comparison of this perfectly new work with the two first editions. All the vast mass of historico-geographical matter formerly distributed over two large maps (with five small additions in the corners) has undergone an entirely fresh arrangement both with regard to space and time. The four principal maps are surrounded by no less than forty-six minor ones, including plans and topographical illustrations. By this subdivision not only have the particulars required for the sake of distinctness been greatly advanced, but the completeness of the work has altogether attained a degree that even the scholar and the well-read historian may glean many valuable details from these excellent sheets. For the investigation of the military events and diplomatic arrangements under which the German territory has been subjected to so many changes within the course of a single century, next to the records and original documents themselves, no better assistance is likely to be met with than reading them with the eye on these collateral and successive drawings. On the first map is given Germany from 1742 to 1803—from

the Conquest of Silesia to the settlement of the Empire in accordance with the decrees of the Peace of Luneville, showing as well the various accessions to Prussian territory (chiefly acquired at the three several partitions of Poland) most carefully marked, as the electorates, duchies, spiritual and secular principalities, the free cities, the counts and knights of the Empire still left in their sovereign existence. A separate sketch illustrates the Austrian Netherlands, together with the Palatinate and the spiritual electorates of Mainz, Trier, and Köln about the year 1789. Another tablet sketches the electorate of Saxony nearly smothered by Brandenburg, Silesia, and Bohemia. The lower part of the sheet is filled up with minute plans of the principal battles lost and won by Frederic the Great. N. 47 is a special map of the South-west, including Elsass and parts of Lothringen, all the country between Coblenz and Basel, Augsburg and Nancy, both within and without the Empire, and in the hands of so many sovereigns and spiritual or municipal corporations, just before the outbreak of the French Revolution in 1789. At first sight the map appears almost bewildering, owing to so many patches, large and small, in the glare of more than thirty shades of colour, and filled with minute letterpress; nevertheless they are all systematic guides through the labyrinth of such a state of political decomposition. The centre of N. 48 is filled by a map of the state to which Germany was reduced between the years 1807 and 1815. Crippled Prussia, Bavaria nearly extended to the same size, and the smaller States continuing as members of the Confederation of the Rhine, all which territories were nearly crushed by the colossal masses of the French and the Austrian Empires. Two smaller sketches explain the condition of the country after the incorporations and secularizations of 1803 and after the dissolution of the Empire on the 6th August, 1806. Small plans of the battle-fields from Ulm to Waterloo are added on the lower margin. The chief map of N. 49 belongs to the well-known time of the Germanic Confederation between 1815 and 1866. Additional sketches produce the Duchies of Schleswig-Holstein in 1864, together with plans of the lines of Danewerk and Düppel-Alsen; the seat of war in Bohemia, 1866, together with a croquis of the neighbourhood of Königgrätz; the military geography of the Confederation, and the growth of the Zollverein since 1833, in three very instructive tablets. The student of history, the politician, and indeed every educated man, will hail the publication of these highly finished maps, the composition of which must have required an amount of research, historical, geographical, and statistical, which contracted within few degrees of longitude and latitude seems perfectly amazing.

During a considerable period the annalist, Lambert of Hersfeld (printed in *Perts, Scriptores*, vol. iii. and vol. v.), has been considered the most trustworthy contemporary historian of the great struggle between Henry IV. and Pope Gregory VII. Both German and foreign scholars vied with each other to represent him as a model of mediæval historiography. This opinion, however, was slightly shaken by a learned paper read by Ranke before the Berlin Academy in 1854; notwithstanding which Giesebrecht, *Geschichte der deutschen Kaiserzeit*, although not without certain critical misgivings, still grounds the narrative of the years 1069-1076 mainly on Lambert's authority. Since this time it has become a favourite subject of young scholars taking their degree to investigate Lambert's veracity and authenticity, not only in substance but in kind, most minutely with regard to each particular notice contained in his chief work, and in constant reference with the party animosity roused by the great contest itself. Lefarth, *Lambert von Hersfeld: ein Beitrag zu seiner Kritik* (Düsseldorf, 1871), explains numerous mistakes and wilful distortions of the truth which it is impossible to palliate from his having been a violent partisan of the rebellious Saxons. On the other hand Hans Delbrück, *Ueber die Glaubwürdigkeit Lamberts von Hersfeld* (Bonn, 1873), the latest author on the subject, annihilates with almost hypercritical acuteness the last remnant of trustworthiness. Going over once more the principal portions of the narrative step by step he comes to the conclusion, most deleterious to Giesebrecht's mild theory, that Lambert, though a rare master of the form, an excellent writer, a poet, an artist, fails altogether in the indispensable qualities of the historian. The accomplished Benedictine scholar is proved to be neither just towards the king, nor a staunch adherer to the princes, nor a faithful servant of the pope; but writing with personal spite, delights to introduce every unfounded rumour in the shape of a well-told historical fact. His narrative is nothing else but an insoluble tissue of truths and lies, so much so that henceforth every positive accusation or praise of the king, for instance, resting on the testimony of Lambert of Hersfeld requires other and better evidence before it can be taken as genuine.

It is curious to observe how the present conflict between Church and State which threatens to become more violent every day is promoting largely the study of papal history and of canon law as constantly bordering upon it. Since the remarkable book of R. Zoepffel on the Ceremonies of Papal Elections between the eleventh and fourteenth centuries (reviewed in the *Academy*, No. 38, Dec. 15, 1871) a similar work by Moritz Meyer, *Die Wahl Alexander III. und Victor IV. (1159): ein Beitrag zur Geschichte der Kirchenspaltung unter Kaiser Friedrich I.* (Göttingen, 1871), has become better known. It is

a production of the same methodical school of critical investigation, discussing from the reports as recorded on both sides the merits and demerits of this celebrated double election. Lately the subject has been taken up again on a more general scale, correcting at the same time some details, and drawing more precise conclusions in the spirit of the canon law, in two reviews by Dr. Carl Weizsäcker, Professor of Ecclesiastical History in the Protestant Faculty of Divinity at Tübingen, which will be of great use to all who are engaged in similar researches. They are to be found in the *Fahrbücher für deutsche Theologie*, vol. xvii. 486, *Die Papstwahl von 1059 bis 1130*, and vol. xviii. 1, *Die Decretale licet de vitanda*. Last, but not least, we must not omit to draw attention to another important essay by Constantin Höfler, Professor of History in the University of Prague, *Wahl und Thronbesteigung des letzten deutschen Papstes Adrian's VI., 1522*, published in the *Sitzungsberichte der phil. hist. Classe der Kais. Akademie der Wissenschaften*. (Wien, October, 1872.) The learned author is not likely to overlook any source of materials that may be available, the Roman documents in Rinaldi or the despatches published from the Burgundian records at Brussels and the Imperial at Vienna. He has found his chief support, however, in that inexhaustible storehouse of English and European history at the beginning of the sixteenth century, the marvellous collection of Brewer, *Letters and Papers of the Reign of Henry VIII.*, vol. iii.

The publication of larger works has for some time been considerably retarded owing to the compositors' strike in the Leipzig printing offices. It has not prevented, however, the issue of Von Ranke's *Aus dem Briefwechsel Friedrich Wilhelms IV. mit Bunsen* (Leipzig: Duncker u. Humboldt, 1873), which may be called quite an unusual event. A book on such a recent period, the intimate correspondence of a sovereign who never became a friend of the progress of the age, and consequently never could be the favourite of his contemporaries, though edited by the celebrated conservative historian, would have been impossible in the world of German literature without the enormous political and social changes which will make the reign of his brother William I. ever memorable. Though the time is not come yet for a critical history of his less fortunate predecessor, it is not unlikely that public opinion will be better willing to judge more fairly about a monarch who was neither competent to rule as absolute sovereign nor as constitutional king, but who, in spite of his romantic whims, reactionary politics, and dilettante humours, was nevertheless an exceptional genius, full of noble and jovial spirit. There was a time when his sayings, witticisms, and speeches excited public attention, and when people more or less initiated used to hint mysteriously that his letters, few of which hitherto had become public property, were only to be compared with those of Goethe. At last this most extraordinary batch of them, from which several quotations are made in the well-known life of Baron Bunsen by his widow, has been published, to be sure with a certain necessary discretion due to the man himself and some other persons still alive, but on the whole with an incomparable fairness and a most excellent commentary both personal and general. Liberal and radical criticism will probably not spare the veteran historian, who is generally known only as the first authority for the sixteenth and seventeenth centuries; but even his opponents will be surprised by the consummate knowledge and terse, brisk style in which he sketches the European politics of the nineteenth century, as well as the special history of Church and State in Prussia. The correspondence with Bunsen, of which chiefly the king's letters are reproduced, extends over the years 1830 to 1857, and is grouped in twelve chapters, all alike attractive: the beginning of the friendship with Bunsen, the conflict with the Archbishop of Cologne, the ecclesiastical ideals of the Crown Prince, the Jerusalem bishopric and Frederic William's visit to England, the foundation of a feudal constitution for the kingdom of Prussia, the complication occasioned through the principality of Neuchâtel being absorbed into the remodelled Swiss Confederation, radicalism and liberalism in connection with the events of February and March, 1848, the Frankfurt constitution for Germany, the king declining the imperial crown, the Berlin House of Lords and Napoleon III., the Oriental question and the Crimean war, and the king's evangelical views in his last years.

Not only on account of some of these chapters, but from its general bearing, the book will most likely find many readers in England, and a translation may even be put side by side with Bunsen's Life and the Memoirs of Baron Stockmar. The striking contrast between the three men and the very different treatment they experience from the hands of their editors cannot but help raising the memory of King Frederic William IV. to the place really due to him in history. R. PAULI.

We are glad to notice the intended publication of the unpublished papers extant in the archives of the Benedictine Monastery dedicated to the Holy Trinity at Cava in Tyrrenia. These papers seem with interest as regards the history of Italy. They were widely consulted by Charles Troya for his History, and have formed the groundwork of the diplomatic studies of many learned celebrities. They extend from the end of the eighth to the middle of the twelfth centuries, and are an almost inexhaustible source of information regarding public rights, manners and customs, agriculture and commerce, of the Middle Ages; at the same time they will furnish fresh information for philological study.

It is supposed they will occupy seven or eight quarto volumes of 400 pages each, which will be accompanied by chronological tables and classified indexes, throwing much light on the Latinity of the Middle Ages. Many other interesting additions will be made by way of facsimiles and autographs.

### Contents of the Journals.

H. von Sybel, *historische Zeitschrift*, zweites Heft, 1873.—M. von Knonaw shows that the Chronicle of Vitoduran (J. von Winterthur) was written in the Franciscan convent of Lindau during the long and dreadful interdict which the Avignon Pope cruelly laid on Germany during the Black Death, and that the Franciscans took the side of the Emperor against the Pope.—An analysis of the political theories of Hippolithus a Lapide (i.e. probably the historian Philip Chemnitz) as to the German Empire follows; the view that the sovereignty resides in the Diet and not in the Emperor had much influence in the polemical discussions of the Thirty Years' War.—Von Reumont discusses some late contributions to Italian history chiefly as to the cities of the March, Ancona and Fermo, and as to Ferrante the Aragonese king of Naples, whose letters and ordinances throw light on the events of the last years of the fifteenth century.—Stumpf reviews the first volume of the *Diplomata Imperii*, edited by C. A. F. Pertz, son of the renowned editor of the *Monumenta Germaniae historica*. The son's edition of the charters of the Merovingian age is spoken of very unfavourably, and the article is almost in the nature of an indictment. A late pamphlet by Sichel, *Diplomatum Imperii, tomus i., besprochen von Th. Sichel*, arrives at similar conclusions as to the badness of the edition. There is but too much justification for the charges; though something of personal hostility to the kind of dictatorship exercised by the elder Pertz in the publication of the German Chronicles and Records is very visible, and a disinclination to see it continued in the person of his son.—A review of Stölzel's *Die Entwicklung des gelehrten Richterthums in deutschen Territorien* shows how the substitution of judges trained in the Roman law for the old local authorities (*schöffen*, &c.), who decided by local custom and partly created the law which they administered, was connected with the general growth of the central authority and consequent diminution of local rights in each territory.—Zeller contributes a short notice on the argument of Lipsius' book on the legend of S. Peter at Rome.

*Literarisches Centralblatt*.—Feb. 1 reviews Beal's *Catena of Buddhist Scriptures*, Alabaster's *Wheel of the Law*, and Steele's *Eastern Love Story*, with deserved praise for the services English authors are now rendering to the knowledge of the real Buddhist life and modes of thought. Feb. 8 draws attention to Kiepert's new Biblical maps on a large scale, and to Schmidt's dissertation "On the method of teaching geography in schools." Feb. 22 has a further notice of Kiepert's maps, and criticises Valentin's view as to the "Venus" of Milo, that it was once combined with a statue of Mars. March 1 notices the new German edition of Rilliet's book on the legend of William Tell, and Bucheler reviews Conze's and Schöne's dissertations on Greek reliefs—suggesting several corrections of inscriptions. March 8 points out the excessively faulty character of Montault's *Muses et Galleries de Rome*. March 15 reviews Morosi's *Dialecti Graeci della terra d'Oranto*, and several modern Greek comedies, and high praise is given to Mätzner's Glossary of his *Allenglische Sprachproben*, and to Whitley Stokes' *Old and early-middle Irish Glosses*. March 22 draws attention to Lasinio's edition of the Hebrew translation of Aristotle's *Poetics*, itself translated from Averroes' Arabic translation, which is also to be published; there is nothing to be gained from the Hebrew now published. The German translation of Jonckbloet's *History of the Literature of the Netherlands* is commended. March 29 reviews Gfrörer's *History of Venice to 1084*, which is treated from the point of view of its connection with Constantinople—it is in fact partly a contribution to Byzantine history. April 5 reviews Bruhns' *Alexander von Humboldt* and Springer's life of Dahlmann—the latter contains Prince Albert's letter on the events of 1848 in Germany. Notices are given of Scheler's *Etymological French Dictionary*, and Caix's *Dissertation on the Dialects of Italy*. April 12 analyses the fourth volume of Giesebrecht's *Geschichte der deutschen Kaiserzeit*—the Hohenstaufen period, the first volume of Ascoli's *Archivio Glottologico Italiano*, and the third part of Schmitz's *Die neuesten Fortschritte der französisch-englischen Philologie*. April 19 Bucheler reviews Ulrich's *Codex urbis Romae topographicus*, and Jordan's *Topographie der Stadt Rom*. Notices follow of Ilg's *Ueber den kunsthistorischen Werth der Hypnerotomachia Poliphili*, and Edelsberg's *Quellenschriften für Kunstgeschichte und Kunsttechnik des Mittelalters und der Renaissance*. April 26 contains an interesting account of Hegel's *Ludwig I., König von Bayern*, and notices the completion of Andree's *Geographie des Welthandels*. May 3 analyses Winkelman's *Philipp von Schwaben und Otto IV. von Braunschweig*; the notices of our Richard I. contained in it are interesting. May 10 criticises very unfavourably Vámbéry's *Geschichte Bochara's oder Transoxaniens*, pointing out at great length the unsatisfactory use made of the original authorities. C. W. BOASE.

## Philology.

**Hermathena.** A series of papers on Literature, Science, and Philosophy. By Members of Trinity College, Dublin. No. 1. Dublin: Edward Ponsonby. London: Longmans.

EVERYONE who is interested either in the advancement of learning or in the part to be taken in that work by the great Universities will welcome this publication. It is very much on the plan of the Cambridge *Journal of Philology*, except that the contributors are all members of a single foundation. The type and paper are of the same handsome character: the outside cover is in a simpler and more pleasing style. We trust that the support of a periodical of this kind will soon become one of the recognized tasks of a seat of learning, and a task none the less imperative because not prescribed by the statutes. It is desirable as a means of encouraging a kind of work which is not immediately available for teaching purposes; and it serves as a channel by which the instructed public opinion of the University may be brought to bear upon the wider body of public opinion outside.

The fifteen papers in the present volume will bear favourable comparison with those of any similar foreign periodical. They are very various in subject as well as in length and manner of treatment. Taking the three heads mentioned in the title, most of the papers would fall under the head of "Literature:" only two belong strictly to "Philosophy," and two to "Science."

The first and longest article consists of "Strictures on Mr. Luard's Edition of a French Poem on the Life of Edward the Confessor," by Dr. Atkinson, the professor of Sanscrit. The strictures are of the severest character. Experts must decide whether the general language employed in condemnation of Mr. Luard's edition is justified or not. So much is clear, that Dr. Atkinson in his review makes a large number of just observations, pointing out a satisfactory meaning in many cases where Mr. Luard had failed to do so, or restoring a sound text where Mr. Luard's was corrupt. It is obviously a different question what degree of ignorance, carelessness, or want of ability this implies on Mr. Luard's part, and it is a question to which the attention of the Master of the Rolls is imperatively called by Dr. Atkinson's paper.

Dr. Salmon's paper on "The Chronology of Hippolytus" is an example of the combination of historical with mathematical study such as it would be difficult to match. Apart from the intrinsic value of the subject, it was worth while to show by a brilliant example how much may sometimes be gained by preserving the unity of knowledge: or rather (since it is impossible to combine all knowledge) by refusing to fall in with the deep grooves to which modern specialists are so apt to confine themselves.

The twenty-five pages which Mr. Davies contributes "On the meaning of certain Homeric words" are not without interest, but are written in a discursive and facetious strain to which we rather grudge the excellent type and paper thus consumed. The chief if not the only word discussed is *ἀλφειῶν*, "eater of barley meal:" the point being that baking was unknown in the times described by Homer. This curious conclusion is made highly probable—to say the least—by Mr. Davies.

Mr. Palmer's article "On Paley's *Propertius*" is directed especially to show that the corruption of the text of *Propertius* has been underrated. The emendations proposed are thoroughly well considered, and often very skilful. But it is impossible to give a fair account of them by the *ex pede Herculem* method. The same may be said of Mr. Tyrrell's article "On the Letters of Cicero to Atticus," in which there are several excellent emendations and, what is often better, notes showing that previous emendations were unnecessary.

Of the shorter papers we would call especial attention to No. xii, three notes by Mr. Mahaffy on Aristoph. Eq. 258-265, Eur. Med. 68, and Tac. Ann. xi. 29. In each of these places the reader has the sense of a definite and indisputable gain to knowledge.

It is perhaps hardly fair to dismiss so considerable a volume as this in these brief and general terms; but it seemed better to give some account of its character and purpose without excluding the alternative course of dealing with particular articles more at length hereafter. Such a separate examination may be more satisfactory to the students of particular subjects, and will certainly not diminish the favourable impression produced by the book as a whole, especially by the combination of a high scientific standard with a certain vigour and fertility characteristic, perhaps, of the nation to which the writers belong.

D. B. MONRO.

## UNEXPLORED SYRIA.

To the Editor of the ACADEMY.

Vienna, May 6th, 1873.

SIR,—Perhaps you will kindly allow space for a few lines upon the subject of the valuable and appreciative review in the columns of the *Academy* (March 15th, 1873).

Professor Th. Nöldeke's dogmatic criticism is truly a benefit to his author, and contrasts favourably with the aesthetic compound which passes as a review in England, and which we are so often doomed to swallow. It justifies the motto "*Inter silvas Academi*," &c. But there are certain details in the review which the reviewer will, I am sure, be pleased to see reviewed, and which may, moreover, perhaps interest a certain portion of the public.

One is surprised to see a learned Orientalist with so little practical knowledge of El Islam as to write as follows: "It might at the outset be questionable to entrust a man with the care of English interests in Syria, of whom it could not remain a secret that he had committed that terrible offence in the eyes of a Muslim of having made the pilgrimage to Mecca as a Christian."

Firstly I went to Meccah not as a Christian, but as a Moslem. Secondly the popular Moslem idea of one who has circumambulated the House of Allah, who has bowed before the tomb of the Prophet, and who has prayed in the presence of the Saints, is simply that, however Giaour-like be his after-life, the heart cannot but have been touched, and the conscience will not fail to speak. The perfume of such sanctity, to use their own phrase, must still dwell in the sensorium of the pilgrim's soul, and its influence must, sooner or later, lead him into the path which is straight. And permit me to state, contrary to the usual opinion, that no religionists with whom I am acquainted are more tolerant than the Ulema, the really learned Moslem divines. When the Amir Abd el Kadir, who now lives a priestly life, heard of my visit to El Hejaz, his only remark was, "If he has done so, is the Holy Land in any way the worse?" He honoured me with his friendship, and our intimacy lasted till I left the country.

The truth is that Damascus was looked upon as a desirable post, as a kind of promotion, being political and not commercial. My ability to hold it was misrepresented accordingly. Looked upon as a prospective victim to Arab fanaticism, I had much trouble in explaining the true

state of the case to those in office. I represented that my difficulty would be the reverse of what was published, that the Moslems, not the Christians, would expect to be the favoured party at the British Consulate, and that, though it would be easy to do justice, it would not be easy to avoid exciting jealousies. So indeed it proved. The Moslems had no feeling against me. This was shown by the visits of the chief divines from the great Amawi mosque, where my wife was admitted at the prayer-hours, and where after my sudden recall a public "function" was held for my return. The Christians also, after a time, learned to believe in my impartiality, as a number of documents in my possession may prove.

M. Nöldeke offers a suggestive idea in the following lines: "The only question that remains is, how to explain the wide prevalence of such a view" (namely, the notion of gigantic stature among primitive nations) "on psychological grounds." This is hardly the place to attack a subject of such importance. But I may briefly record my impression that physical size, being everywhere associated in man's young mind with the force, the greatness, and the majesty which lead to respect and adoration of the chief and the king, the forefathers of all races became material giants to their posterity. Thus Adam's head touched the lowest heaven, and, to mention no others, Moses was a Titan. Hence also the almost universal symbol of horns.

M. Nöldeke is kind enough to regret that I have not spoken at greater length about the modern inhabitants of Syria. His highly interesting subject has been reserved for a future work, "Personal Experiences in Palestine and the Holy Land." I am delaying it purposely, in order to write with temper and calmness upon a subject which for me still has no small share of excitement. The same must be said about the results of Protestant and Catholic missions in the nearer East. And I shall certainly not recommend the substitution of any "native Government" for the Turkish: with M. Nöldeke my trust is in a more energetic policy on the part of England, and in a Euphrates Valley Railway that will create material and commercial interests for her and will form a base-line upon which her beneficial influence can be massed. Foreigners, reading the ignorant trash talked in the House of Commons, and seeing the front of brass with which the Mesopotamian Valley is declared "never to have been civilized," must despair of seeing the latter measure carried out. Not so the Englishman. We have waited patiently since 1834, and still we are strong to wait. The next Indian mutiny shall end our long waiting and the policy which will have caused it.

I am perfectly aware that Arabic, modern and colloquial, and even classical and mediæval, is far from sufficient for interpreting proper names in Palestine, and that Syria, especially the Libanus, still preserves many derived from Aramaic and other Semitic dialects. But I have always tried to supplement my "linguistic failings"—which ought to have been specified by M. Nöldeke—by consulting the best living authorities, and I have generally recorded the philological explanations of these experts. At Damasçus I was assisted by the well-known scholar Dr. Meshaka, and, not to mention a host of others, by the Syro-Catholic bishop, Matrân Ya'akûb. Amongst the Druzes I consulted the highest "akkâls" (illuminati), and in the interior I never failed to apply for interpretation to the Bedawin. The peasants' tradition, we see, confirms that of the learned geographer Yâkût. If M. Nöldeke will kindly point out a few "failings," in a definite and not in a general way, I will tell him whether they are my work or that of my friends. If I have over-estimated *Ancient Faiths embodied in Ancient Names*, it was with the specific object of drawing attention to a work which has been unduly neglected by our public, and which even the reviewer characterises as "well-intentioned." There are certain *manæres* in English feeling which are not understood and which cannot be understood out of England.

About the Hamah stones I am happily able to differ *to o coelo* from M. Nöldeke, who asserts far too hastily that "there is not the remotest chance of our being able to decipher the entirely unknown characters in which they are written." By the kindness of Ritter A. von Kremer a copy was sent to M. Reinisch, the highly distinguished Egyptologist and Oriental Professor at the University of Vienna. This gentleman

has informed me personally and by letter that, though he cannot find, with the Reverend Dunbar I. Heath, the cartouches of Thothmes and Amenophis, the form is undoubtedly alphabetic, and that he does not doubt his power of deciphering the legends. He merely wishes to finish his present work (*Der einheitliche Ursprung der Sprachen der alten Welt*) and to collect the latest additions to the alphabet. The Rev. Mr. Heath, speaking of the Moab door-post, assures us (*Journal of the Anthropological Institute*, January, 1873, page 33) that out of nineteen distinct characters he has found no less than five identical with five out of the forty-five Hamath characters.

With respect to the Oriental and other inscriptions appended to *Unexplored Syria*, I cannot here enter into the lengthy explanations which would perhaps modify M. Nöldeke's judgment; and my friend Mr. Vaux, who kindly lent a few hours of his valuable time, may be left to vindicate his "thoroughly unsatisfactory work." Happily I have preserved all the original transcripts made by Mr. C. F. Tyrwhitt-Drake and myself: if M. Nöldeke will favour me with his address I shall be happy to let him inspect them.

Upon the subject of the Mesha Stele the author and the reviewer will probably keep their own opinions. I find the Moabite inscription to read like history, and the Book of Kings to represent the romance of history. Let the reader judge for himself whether the discrepancies be few or many and momentous—he can decide as well as either of us. But M. Nöldeke certainly underrates the number and the importance of that majority which in England is guided or rather is governed by purely "dogmatic considerations." Otherwise he would hardly have asked, "What is the good of repeating the tirades of the Abbé Richard against the high antiquity of the human race?" The Abbé's theories are at this moment being supplemented by M. F. Chabas. Lord Arundell of Wardour's *Traditions principally with reference to Mythology and the Law of Nations*, in which extensive reading and candid sincerity combine to vindicate the "historical account of the human race," may prove that however settled the question may be considered in Germany, many Englishmen still hold it to be *sub judice*. I for one am happy to see such books, as they teach us where to *frapper toujours et frapper fort*. But again we must not expect the Saxon to legislate for the so-called Anglo-Saxon.

In conclusion I would once more offer my best thanks to M. Nöldeke for his valuable review, and assure him that I shall look forward to deriving instruction from his pen when he notices my next work on Syria and Palestine.

RICHARD F. BURTON.

[We have pleasure in inserting this reclamation, and could wish that all statements of the kind were expressed in as conciliatory a tone. It is however obviously impossible for us to invite Captain Burton and his reviewer to a discussion of points of Semitic philology in our limited space.—ED.]

### Intelligence.

The first fascicule of a new periodical, called *Mélanges d'Archéologie Égyptienne et Assyrienne*, has been published at Paris. It will be for France what Lepsius's *Zeitschrift für Aegyptische Sprache* is for Germany, with the advantage of being larger in size and of placing cuneiform discovery on an equal footing with Egyptology. De Rouge was intended to be the chief editor; and the Introduction, as well as the *résumé* of a course of lectures on the monuments of Karnak by this lamented scholar, will be read with great interest. Perhaps we might disagree with some of the geographical identifications put forward; but Egyptian students have always been daring in this matter. Another valuable paper on certain monuments of the reign of Tahraka is also contributed by the late Vicomte. There are besides a good essay on the name and use of iron and loadstone in ancient Egypt by Devéria, and a monograph on a Greek inscription from Memphis by E. Miller and Mariette-Bey. Two Assyrian papers come from Oppert and Lenormant. The first describes a cuneiform inscription which the writer has found in the Museum of Zürich, and which he shows to be dated in the reign of the Parthian king Pacorus, the contemporary of Domitian. This conclusion is confirmed by Mr. Smith's recent discovery of other tablets dated in the Parthian period, which bring down the use of the cuneiform characters to a comparatively late era. The translation of a curious Persian cylinder legend is added. Lenormant's contribution is a part of the text which gives the

story of the descent of Allat into Hades, together with a transliteration. The contents of the first number guarantee the soundness and excellence of the publication, and it has our best wishes for its success.

The success of the *Daily Telegraph* expedition to Assyria and Babylonia, under the control of Mr. George Smith, is eminently gratifying. A telegram dated April 26th announces explorations of the country from Mosul to Hillah and Tel Ibrahim and the discovery of about eighty new inscriptions. A letter published in the *Daily Telegraph* of May 14th, within two days before the commencement of systematic excavations, describes the inscriptions already obtained by purchase or from the surface of the ground. The most important of these is a tablet belonging to Rimmon-nirari (B.C. 1350), which is dated in the Eponymy of Salmanurris, showing that an official chronological record was kept at this early period, and that the dates therefore assigned to ancient events in the later inscriptions may be safely depended upon. Another monolith increases our knowledge of the Cassite dynasty which ruled over Babylonia from the sixteenth to the thirteenth centuries B.C., and we find that the intermarriages between these kings and the royal family of Assyria had introduced Semitic names among them. The monarch to whom the monolith belongs is Merodach-Baladan, son of Mili-Sikhu, and grandson of Curi-galzu, and its purpose is to reward the panegyrics of a court-poet with a present of land. Some other valuable inscriptions belong to the Parthian period, thus bringing down the use of the cuneiform system of writing to a comparative late epoch, and confirming Dr. Oppert's recent discovery (already noticed in the *Academy*). They refer to two eras, one Parthian and the other Greek, and all contain the name of Arsakes. Mr. Smith's last telegram was sent from Mosul, May 19th. He has been exhuming the Royal Library of Nineveh, and has found not only Syllabaries and other bilingual tablets of great value, but also the missing portion of the Deluge-story. In his letter he had stated that he had already discovered part of a series of early Babylonian legends, which may throw much light on the history of primitive religious thought and civilization in Western Asia. It is to be hoped that Mr. Smith will be allowed to continue his researches, the first fruits of which have produced such highly important results.

In Emanuel Deutsch Semitic philology has lost one of its most promising scholars and culture one of its most finely tempered instruments. Unfavourable circumstances and of late declining health prevented Mr. Deutsch from realizing the high expectations of his friends, but of his rare capacities there was but one opinion among those who knew him best. His eloquent essays on the Talmud and Islam in the *Quarterly Review* revealed the gifted interpreter between science and general culture. But the monument of his life was to have been a great work on the Talmud, fragments of which, it is to be hoped, may yet be published. Next to the Talmud Mr. Deutsch was most interested in Phœnician studies. He contributed a slight but characteristic notice of Schröder's *Phœnische Sprache* to an early number of the *Academy*, and was indirectly concerned in editing the Phœnician inscriptions of the British Museum. He was also among the first to recognise in the columns of the *Times* the importance of the discovery of the so-called Moabite stone. Mr. Deutsch was on his way home from a journey to Egypt, undertaken for the recovery of his health.

A well-known historical critic (A. v. G.) gives a somewhat severe review of Vambéry's *Geschichte Bochara's* in the *Lit. Centralblatt* for May 10. He describes the book as pretentious and uncritical, and desiderates a more complete examination of the original authorities.

Mr. R. Hassoun, a clever Oriental printer, has brought out in improved Arabic type the *Divân of Hâtim Thâyi*, a contemporary of Nâbigha Dhobyânî. It may be had of Messrs. Trübner & Co.

Dr. Güdemann, rabbi at Vienna, will shortly publish the first part of an important work on education amongst the Jews in the Middle Age. This part will comprise the Jewish schools in Spain, in which were composed the most interesting works in all branches of Hebrew literature. This publication, which contains a great number of unpublished documents, is sure to fill up a gap in the history of school education. Indeed the most erroneous notions on mediæval Jews' instruction have been given in the most recent histories of the subject. Dr. Güdemann's book is written in a very fluent style, and will therefore be accessible even to those who are not acquainted with the idioms in which the documents on the subject are written.

The Rev. Dunbar I. Heath gives in the *Journal of the Anthropological Institute*, vol. ii., p. 331 sqq., a transcription with a translation of two inscriptions on jars found by Mr. Shapira in the land of Moab. Prof. Schlotmann of Halle has done the same in the *Morgenländische Zeitsch.*, vol. xxvi., p. 393 sqq. Mr. Vaux, in his report to Mr. Besant, dated the 12th of April, 1873, has declared the Shapira inscriptions to be a bad forgery from the paleographical point of view, and we completely rely upon his authority. Anybody who has only the slightest notion of Hebrew and who has glanced for a moment at the famous Moabite inscription—the language of which is so close to Hebrew—will be astonished to find that, according to Mr. Heath's translation, *י* means *in* and *ב*, *חן* *such*, *חנן* *may he be gracious*, not to speak of proper names like *Hachnasho*, *Dahak Cosbo*, *Nataracu*, &c. Mr. Heath has wisely abstained from justifying his translation; and he had

better have followed the same method for the words *amach* and *omt*: the former means *devoted*, as in Egyptian; the latter is the Hebrew root *אמ*, *with*, and the feminine suffix (perhaps Mr. Heath means the formative *ת* for feminine nouns) compared with the Hebrew word *umash*, "corresponding," and on this ground *omt* is translated by *unity*! But the chief prize of his raid into philology is the explanation of *omt*, which becomes, by an easy transition, *imo*, and is then connected with the Hebrew *thummim* and the Egyptian *matu*. By such a method we would undertake to explain Aristotle out of a Hebrew Lexicon. And what a wonderful addition to comparative mythology in the phrases: "who in the might of her knowledge has been incorporated with Mesho (this word signifies according to Mr. Heath, p. 339, a locality, and not the famous King Mesha); she is united with Hachnasho, in Mesha; she is united with knowledge, raised to unity with Daocash!" A. N.

The numbers of the *Phoenix* for January and February contain several reprints of papers from the journals of learned societies, &c., such as "Bibliographical Notes on Chinese Books," by W. F. Mayers, from *Notes and Queries on China and Japan* for 1867; "On the Colonisation of the Himalaya by Europeans," by B. H. Hodgson, from *Selections from the Records of the Government of Bengal*; under the title of "On the Tribes of Northern Tibet," we recognise also another paper by the same writer which appeared in the *Journal of the Asiatic Society of Bengal* for 1853 under the heading of "Sifan and Hórsók Vocabularies," &c.; an "Itinerary from Phari in Tibet to Sassa," by Dr. A. Campbell from the same society's journal for 1848; and a résumé of a lecture recently delivered at Hongkong on Fung-shuey by Dr. Eitel from the *China Mail*. Beyond these Mr. Howort contributes a paper on the life of Ogotai Khakan, the founder of the Yuen, or Mongolian Dynasty in China, which will be read with interest at the present time, presenting as it does a vivid picture of the sway once exercised by a descendant of Jingis Khan from Corea to Moscow. "A Glance at Education in British Burma," by H. A., gives a satisfactory account of the means at the disposal of even the poorest Burmese for acquiring a knowledge of the literature, such as it is, of the country. In the "Relations of China with Badakhshan and the Afghans" Mr. Mayers gives an interesting sketch of the campaign undertaken by the Chinese Emperor Kanghi to consolidate his power in his newly acquired territories of Ili and Turkestan. The editor contributes a "Note on the Burmese Language," and to his pen probably are to be attributed the *Reviews of Books*, &c., at the end of each number.

### Contents of the Journals.

**Archæologia Cambrensis.** January, 1873.—"The Old-Welsh Glosses on Martianus Capella." [Edited by Stokes; a most important contribution to our knowledge of Old-Welsh.]—"On some of our British Inscriptions." [By John Rhys, who tries to show that British inscriptions are not rightfully claimed by the Irish, and attempts to interpret some of these venerable documents.]—"The Bridell Stone" discussed again by Brash, who maintains his former reading against Ferguson.—April, 1873.—"Llventium: its geographical position, and reasons for assigning it to Llandovery;" by William Rees [who succeeds to make a very good case for Llandovery.]—"Studies in Cymric Philology (No. ii.);" by Evander W. Evans. [This is an excellent paper and raises the hope that not a line of the Gwawdodyn will long remain unintelligible.]—"Our British Inscriptions." [Continued by John Rhys, who endeavours to show the groundlessness of the Irish claim to the Penrhos Llugwy inscription.]—"Original documents" [continue to add greatly to the value of this journal.]

Just Published.

**Homer's Odyssey. First Twelve Books.** In two vols. 8vo. Edited by HENRY HAYMAN, D.D., Head Master of Rugby School, with prefaces, notes, and appendices, and collations of several MSS. Price of each volume, 14s.

D. NUTT, 270, Strand.

BY THE SAME.

**A Fragment of the Jason Legend.** 12mo., 2s. PARKER & Co., Oxford.

No. 1. in 8vo, 268 pages, price 4s. sewed.

**Hermathena; a Series of Papers on Literature, Science, and Philosophy.** By Members of Trinity College, Dublin. (To be continued Annually.)

London : LONGMANS &amp; Co. Dublin : E. PONSONBY.

Just Published, crown 8vo, price 5s.

**The Dialect of Cumberland; with a Chapter on its Place-Names.** By ROBERT FERGUSON, Author of "The Teutonic Name-System," "The River-Names of Europe," &c.

By the same Author, 8vo, price 14s.

**The Teutonic Name-System, applied to the Family Names of France, England, and Germany.**

"The interesting and comprehensive problem the author himself thus sets before us. His object is to bring into connection the family names of France, England, and Germany, so far as the German element is concerned, as members of one common family, and to arrange them on a definite system, in accordance with the nomenclature of the old Germans. He holds the opinion that a large proportion of French as well as English names are of Teutonic origin, which, heretofore, has not been assumed to be the case to the same extent. . . . All this he has worked out with independent judgment, and, it must be admitted, with general correctness: he has, moreover, made some new suggestions, which commend themselves, for the explanation of French and English names."—*Professor Dietrich, in the Jahrbuch für Romanische und Englische Literatur.*

Also, by the same, post 8vo, price 4s. 6d.

**The River-Names of Europe.**

"The most uninterested reader may find himself amused as well as edified."—*Athenæum.*

"Mr. Ferguson brings much learning and ingenuity to his self-imposed task."—*Notes and Queries.*

WILLIAMS & NORGATE, 14, Henrietta Street, Covent Garden, London; and 20, South Frederick Street, Edinburgh. STEEL BROTHERS, Carlisle.

UNIVERSITY COLLEGE, LONDON.  
CLASSICAL ARCHAEOLOGY.

**A Course of Six Lectures on this subject**

will be delivered on Tuesdays and Fridays, beginning on June 6th, at Three p.m., by BUNNELL LEWIS, M.A., F.S.A., Professor of Latin in Queen's College, Cork.

Ladies will be admitted to the course. Fee £1 1s. A syllabus of the Lectures may be obtained on application at the College.

JOHN ROBSON, B.A.,  
Secretary to the Council.

UNIVERSITY OF LONDON.

**Notice is hereby given, that the next Half-**

yearly Examination for MATRICULATION in this University will commence on Monday, the 30th of June, 1873. In addition to the *Metropolitan Examination*, Provincial Examinations will be held at Owens College, Manchester; Queen's College, Liverpool; St. Cuthbert's College, Ushaw; and Queen's College, Birmingham.

Every Candidate is required to transmit his Certificate of Age to the Registrar (University of London, Burlington Gardens, London, W.) at least fourteen days before the commencement of the Examination.

Candidates who pass the Matriculation Examination are entitled to proceed to the Degrees conferred by the University in Arts, Laws, Science, and Medicine. This Examination is accepted (1) by the Council of Military Education in lieu of the Entrance Examination otherwise imposed on Candidates for admission to the Royal Military College at Sandhurst; and (2) by the College of Surgeons in lieu of the Preliminary Examination otherwise imposed on Candidates for its Fellowship. It is also among those Examinations of which some one must be passed (1) by every Medical Student on commencing his professional studies; and (2) by every person entering upon Articles of Clerkship to an Attorney,—any such person Matriculating in the First Division being entitled to exemption from one year's service.

WILLIAM B. CARPENTER, M.D.,  
Registrar.

May 26th, 1873.

**THE DEGREES OF MARBURG UNIVERSITY.**

**Some time ago it has come to our notice that**

many persons in England call themselves Doctor of Philosophy on account of diplomas supposed to be conferred by the Philosophical Faculty of the University of Marburg. To encounter any doubts in this respect, I declare in the name of that Faculty that only six Englishmen have been created Doctors of Philosophy in our University since the year 1848. The names of those are:

EDWARD FRANKLAND, from Lancaster (23rd Aug., 1849).

JOHN TYNDALL, from London (5th March, 1850).

THOMAS ARCHER HIRST, from Yorkshire (9th Aug., 1852).

FREDERICK GUTHRIE, from London (30th Aug., 1855).

Professor D'ALLEMAND, i. St. Helens (27th Feb., 1856).

EDMUND ALWIN COOK, from London (22nd Aug., 1865).

(Signed) LEOPOLD SCHMIDT.

The Dean of the Philosophical Faculty of the University of Marburg.  
Marburg, 20th March, 1873.

## General Literature.

**Zoological Mythology; or, the Legends of Animals.** By Angelo De Gubernatis, Professor of Sanscrit and Comparative Literature in the Istituto di Studi superiori e di Perfezionamento at Florence. 2 vols. London: Trübner & Co. 1872.

THE author of this book is already very favourably known in his own country and elsewhere by various learned and dramatic works, while the periodical *Rivista Contemporanea* of which he is the conductor enjoys a wide circulation. In the first class may be instanced his essay on *The Vedic sources of epic poetry*, and *The comparative history of bridal customs amongst the Italians and other Indo-Germanic nations*; amongst his dramas the most noticeable are *Roderick the last king of the Visigoths*, *Pierre de la Vigne*, *The Death of Cato*, and more particularly *King Nal*, all of which have been produced on the stage with great success, and some published in several editions. The latter drama, acted before a crowded audience in Florence on April 10th, 1869, has been translated into German by the poet Friedrich Marx (Hamburg, 1870). Gubernatis has also published a very valuable collection of tales (*Le Novelline di San Stefano*, Turin, 1869), which was accompanied by an introduction on the relationship between the myth and the fairy tale. The direction which his researches have principally taken, as well as the outline of their results, was plain from this and his other scientific works. The Vedas were his starting point, and in them, like other recent writers, he believed that the basis of most of the mythological conceptions traceable in the religion, the legends, and the popular tales of the Indo-Germanic nations was to be found. This view appears as the foundation of the work before us, for which the author, as we have seen, had prepared himself by very various studies, while their nature makes itself felt in a double direction, by comprehensive erudition and a bold flight of imagination, leading sometimes indeed further than he may himself intend, and sometimes revealing to him things that are invisible to a more unbiassed spectator. But we must in justice admit that very few inquirers avoid the danger, when they once have adopted a system, of trying to force everything into harmony with it, so that even when it is sound in itself, much irrelevant matter is urged in its

support. Gubernatis himself is well aware of this, as he says at the end of the work: "The principal error into which the students of the new science (of comparative mythology) are apt to fall, and into which I myself have sometimes been betrayed in the course of this work, is that of confining their observations to one special favourite mythical point or moment, and referring almost every myth to it, and not taking sufficient account of their mobility and their special history, that is, of the various periods of their manifestation. One sees in the myth only the sun, another only the moon in its several revolutions, and their amours with the verdant and resplendent earth; one sees the darkness of night in opposition to the light of day, another the same light in opposition to the gloomy cloud; one the loves of the sun with the moon, another those of the sun with the aurora. These diverse, special and too exclusive points of view, from which the myths have hitherto been generally studied by learned men, have afforded ill-disposed adversaries an opportunity of ridiculing the science of comparative mythology as a science which is little serious, and which changes its nature according to the student who occupies himself with it. But this opposition is disarmed by its own weapons. For what does the concord of all learned men and scholars in this department prove? It proves, in my opinion, but one thing, and that is, the reproduction and confirmation of the same natural myths under multiplex forms, the representation by analogous myths of analogous phenomena, and that the variations met with in fairy tales are also found in myths." Gubernatis, I should add, does not depend solely and exclusively upon the Vedas, but observes himself (i. xii.): "As it would be unwarrantable to say that Sanscrit contains in itself all the European forms of language, it would be equally rash to assert that the Vedic hymns contain all our mythology. In them we only look for ancient and authentic proofs to demonstrate how, before the dispersion of the Aryans, certain essential myths were formed, and the norm or law of development of these being proved it will then be possible to reconstruct even the history of those that remain by analogy, and by employing the corresponding materials of the various popular literatures, including the Hindoo literature itself, which followed immediately after the Vedic, where we find legends and mythical notions which sometimes enable us to clear up and complete several

obscure Vedic passages, as well as sometimes offer us new myths of which none of the Vedic hymns that have come down to us preserve any trace. . . . All this abundance of mythical tradition having passed into the Hindoo literature gives it an especial importance as a means of comparison ; but as, notwithstanding this exuberance of legendary literature, many myths have disappeared entirely from the Hindoo tradition, we must acknowledge that India . . . cannot serve as the sole concentric type for all comparison. In some respects the Hellenic mythology and in others the Slavonian, Scandinavian, and German traditions offer far clearer evidences and display far more extensively the mythic motive (or original principle) which they possess in common with India ; in some cases (as already remarked with respect to language) the Indian element is absolutely wanting in the myth, whilst the European manifests extraordinary vitality and expansion." We see that though the Vedas serve as the starting point for Gubernatis' researches, his glance takes in a wide range beyond ; and in this he is perfectly right. Especially with regard to the later Hindoo literature I am able to agree with him from the most profound convictions ; on which point see also Julius Braun, *Naturgeschichte der Sage*, Munich, 1864, ii. 410, 419.

Before proceeding further it will be well to give an idea of the contents of the *Zoological Mythology* ; it falls into three divisions, of which the first, discussing the "animals of the earth," is the most extensive, occupying the whole of the first and part of the second volume, while the remainder is devoted to the "animals of the air" and those of the water. The inequality of the different parts does not presumably result from an inferior abundance of material for treating birds and fishes ; but more probably from the author's having imposed limits on himself, as may be seen partly in the arrangement of the first section, for out of the 600 pages (in fourteen chapters) on the animals of the earth, the first alone on "The Cow and the Bull" takes up 283 pages. From this chapter, which it will be interesting to consider more in detail than the others, we can see what was the original plan, subsequently curtailed, for all. Sect. i. The Cow and the Bull in the Vedic Hymns. Sect. ii. The worship of the Bull and of the Cow in India, and the Brahmanic legends relating to it. Sect. iii. The Bull and the Cow in Iranian and Turanian tradition. Sect. iv. The Bull and the Cow in Slavonic tradition. Sect. v. The Bull and the Cow in the Germanico-Scandinavian and Franco-Celtic tradition. Sect. vi. The Bull and the Cow in Greek and Latin tradition. The other chapters are handled more compendiously, no doubt because the author was afraid of making the work too voluminous, and also because, having once set forth his fundamental theory at length, its further application might be left to the reader, assisted by occasional indications as to the bearing of the facts alleged. With reference to his task Gubernatis observes (ii. 427) : "I have had to prove in mythology its most humble aspect, that is to say, the God enclosed in the animal ; and inasmuch as amongst the various mythical animals which I have endeavoured to describe, several preserve the resplendent and propitious form of the god, they are generally considered as the form which the deity assumes either to feed secretly upon the forbidden fruit, or to fulfil a term of punishment for some fault of his ; in any case these forms never serve to give us a superlative idea of the divine excellence and perfection." But it is not only gods that take the form of animals, the most various natural phenomena undergo the same transformation ; and with reference to this peculiarity and the "primitive domain of the myth" Gubernatis has the following remarks (i. xv.) : "Although the first book bears the title of animals of the earth, the second animals

of the air, and the third animals of the water, there is but one general domain in which all the animals of mythology are produced, and made to enact their respective parts. This domain is always the heavens ; whilst the time during which the mythical action lasts is always subject to many variations, being now the day of twelve hours, now that of twenty-four, now the three watches of the night ; at one time the lunar month of twenty-seven days, at another the solar month of thirty ; sometimes the year of twelve solar, and sometimes that of thirteen lunar months. The drama of mythology has its origin in the sky ; but the sky may be either clear or gloomy, it may be illumined by the sun or by the moon, it may be obscured by the darkness of night, or the condensation of its vapours into clouds. Again, the clear heavens assume at times the appearance of a milky sea, this appearance gives rise to the idea of the cow, and hence the most splendid aspects of the sky are often represented as herds or flocks. The god who causes rain to fall, who from the highest heaven fertilizes the earth, takes the form now of a ram, now of a bull ; the lightning that flies like a winged arrow is represented now as a bird, now as a winged horse ; and thus one after another all the shifting phenomena of the heavens take the forms of animals, becoming at length, now the hero himself, now the animal that waits upon the hero, and without which he would possess no supernatural power whatever. . . . On the other hand, the cloudy or the dark sky assumed in the myths the aspect now of a grotto or den, now of a stable, now of a tree, a forest, a rock, a mountain, an ocean, and linguistic analysis shows how natural such equivocal meanings are ; and these having once taken root, it was still more natural to people the grotto with wolves, the stable with sheep, cows, and horses, the tree with birds, the forest with deer and with boars, the rock with dragons who keep guard over fountains and treasures, the mountain with serpents and aquatic monsters. In a stanza of a Vedic hymn to the gods Indra and Agni, composed with the greatest artistic elegance, the poet sings how the two gods fought side by side for a common conquest, which takes the different names of cows, waters, regions, light, and ravished dawns."

I have let the author describe his work in his own words, from which it is easy to see how extensive is the field upon which he has entered, and how easy it must be, even if his main theory is correct, to go astray in some of its applications, when one and the same conception (for instance, the cloudy sky) is supposed to be represented by the most various objects ; and this, indeed, he admits himself. Tylor too, a most cautious and thorough investigator, though favourably inclined to the theory, observes concerning it (*Primitive Culture*, i. 287) : "At the same time it must be clearly understood that the truth of such a general principle is no warrant for all the particular interpretations which mythologists claim to base upon it, for of these in fact many are wildly speculative and many hopelessly unsound. Nature myth demands indeed a recognition of its vast importance in the legendary lore of mankind, but only so far as its claim is backed by strong and legitimate evidence. The close and deep analogies between the life of nature and the life of man have been for ages dwelt upon by poets and philosophers who in simile or in argument have told of light and darkness, of calm and tempest, of birth, growth, change, decay, dissolution, renewal. But no one-sided interpretation can be permitted to absorb into a single theory such endless many-sided correspondences as these. Rash inferences, which on the strength of mere resemblance derive episodes of myth from episodes of nature, must be regarded with utter mistrust, for the student who has no more stringent criterion than this for his myths of sun and sky

and dawn will find them wherever it pleases him to seek them." Another highly competent judge, distinguished in the field of mythology not less than as poet and scholar, I mean Uhland, was still more severe upon the mythologists who like Gubernatis brought in the whole world of fairy tale to their studies; alluding to the ever living creative fancy of the people he says (*Schriften zur Geschichte der Dichtung und Sage* 8, 620): "We can receive gifts from poverty. It brings to the children of the rich the green Christmas tree of fancy from the snowy winter wood. Mythology is rich, but not so rich that its crumbs can give birth to the whole fairy world (Märchenwelt)." If I understand Uhland aright, he does not mean to exclude the *Märchen* altogether from mythology, only to oppose the extravagant tendency of some mythologists to claim for their own department every creation of the popular fancy. Gubernatis has given abridgments of a great number of Russian and hitherto unknown Italian stories, which are highly interesting in themselves and as contributions to the history of fiction; but it certainly appears as if he had often seen in them something more than is visible to an ordinary eye. Thus in giving an account of a Russian tale he says: "There was once a king who could not find a maiden beautiful enough to suit his taste. One day returning from the chase (the solar hero always meets the aurora, his bride, when returning from the hunt in the forest of night) he meets a shepherd's daughter," &c. (i. 209), and a little further on (i. 211), "This good sister Helen or Little Helen, so careful a guardian of her brother John, ends, when she conceives a passion for the monster, with becoming his perfidious persecutor. (The evening aurora is represented as a friend of the monster of night, who conspires with him against her brother the sun, and whoever observes the sinister aspect often assumed by the reddish sky of evening will find this fiction a very natural one.)" Or (p. 212) "Ivan by the help of his dwarf (or the sun grown small during the night, and perhaps also the moon) accomplishes," &c. Similarly in a Persian tale (i. 125) "A king becomes enamoured of the beautiful Mahrusa, his counsellors tear him from his love, upon which he pines away in solitude and dies. The beautiful girl unites herself to him in the grave (Romeo and Juliet, the evening aurora and the sun die together);" or in a Calmuck tale (p. 129) where six brothers are in love with a beautiful girl: "They fight for her, and, that each may have a part, end by cutting her to pieces. We already know the mythical meaning of this legend." I see here no "mythical meaning" at all, only the traces of what was once a very wide-spread legal custom, that of satisfying a number of creditors or other claimants by giving to each a part of the body of the debtor, or the object in dispute—a custom of which the Roman laws of the Twelve Tables give the earliest proof known to us, while the *Merchant of Venice* is perhaps the latest reminiscence of it preserved. Similarly in the Buddhist legend of Ceylon, Kusa Jatakaya (London, 1871), the beautiful princess Prabavati is claimed by seven kings, and her father, king Madu, to satisfy all the seven and avoid the threatened war, offers to divide his daughter into seven parts and give one to each of the pretenders:

"In seven parts will I divide her body, fresh and fair;  
To each of all the seven kings will I despatch a share!  
Thus will I from the town avert the woes that now impend!"

In other cases too I am unable to agree with what seems to me a forced interpretation, as when Gubernatis says (i. 225): "It is with the head of the most beautiful of the giant Hymir's oxen fastened to his hook that, in Snorri's *Edda*, the god Thor goes to fish up the immense serpent of Midgard from the bottom of the sea, and destroys it upon the seashore. (This myth, if I am not mistaken,

has the following meaning:—The head of the solar, or lunar, bull is devoured by the monster of night; this same head, tossed about, draws up, towards morning as sun, and towards evening as moon, upon the shore of the sea of night, that is on the eastern mountain, the monster serpent: thus Hanumant, in the *Rāmāyanam*, passes over to the opposite shore of the sea, crossing the body of the marine monster, which he causes to burst; thus Indras kills Ahi the serpent upon the mountain.)" Apart from everything else, the words quoted from the *Edda* "and destroys it upon the seashore" are inexact, and convey to the mind a false impression of the proceeding.

This brings me to another point which I will mention here, not to have to return to the ungrateful task of criticizing; the author frequently introduces subjects of which he is either not completely master, or to which he has not devoted the necessary attention; as, for instance, Northern mythology. A few examples will show my meaning. Vol. i. p. 206 we read "Odin too, as Indras and as Bhimas, at three gulps dries up three lakes of mead." In the passage of the *Edda* of Snorri referred to there is no mention of lakes, but of two jars and a kettle (tvö ker ok ein ketil). A little before Gubernatis speaks of a combat between Loki and Thor; in the *Edda* (Gylfag. 46), however, there is mention of a contest between Thor and Utgardloki, but not with Loki his own companion. Again p. 211: "Thus the Scandinavian warrior, Walkiries, has a double aspect, a good and a bad." In the Norse Mythologie or literature there is no mention of a warrior of this name; the Valkyries, as Gubernatis from other passages evidently knows, are something entirely different. i. 222: "The four oxen rush forward and drag Gefion with them into the sea, until they arrive at the land of Seelund." The original text (Gylfag. 1) runs very differently: "Gefion took from Jötunheim four oxen, which she had borne to a Jötun, and yoked them before the plough. Then the plough went so mightily and deep that the land was loosed and the oxen drew it westward towards the sea, till they came to a standstill in a sound. Then Gefion put the land down there, and gave it a name and called it Selund (Seeland)." In consequence of this misquotation what follows in Gubernatis is likewise wrong, viz., "In which it is obvious we have again the Vedic bull with a thousand horns which comes out of the sea, and the bull which carries off the maiden." And why does Gubernatis say of Gefion: "the four oxen her sons (although she is a virgin)"? The above passage scarcely warrants the use of the word. i. 225: "Scandinavian tradition, in the short poem on the dwarf Allwis, offers us the cornucopia in the cup formed of the defence of oxen (i.e. with their horns) in which the god Thor drinks hydromel . . . and this horn moreover, besides serving as a cornucopia, becomes as a golden horn the war trumpet of Odin (the Giallarhorn)." In *Alvissmál* we find nothing of the sort, and the Giallarhorn belongs to the god Heimdall. i. 290: "In the Turkish stories of Siberia, it is upon a non-coloured horse that the third brother . . . advances against the demon Ker Iutpa. The hero becomes the excrement of a horse and the horse a crow; the former glues the monster's lower lip to the earth, the latter suspends his upper lip to the sky. In order better to understand this strange myth, we must remember that the name of one of the Valkyries is 'mist,' a word which means excrement and fog. The fog, or frost, or rain, or dew falls to the ground, the solar horse, or the sun, rises in the sky; the monster of night or of clouds is dispersed." This would be a very hazardous interpretation, even supposing that the word *mist* in Old Norse had the meaning *excrement*: but this is simply not the case; Gubernatis has been misled by the German word *mist*, and the whole com-

bination falls to the ground. i. 421: "Thor kills his he-goats. . . His son, Thialfi, steals the thigh-bone of one of the goats," &c. Thialfi is not the son of Thor, but of the peasant with whom he lodges. ii. 6: "Thor to whom the hog is sacred." For Thor read Freyr, as Gubernatis says rightly on the next page, "The chariot of Frey is drawn by a hog" (or rather boar). ii. 87: "The four stags that stay round the tree Yggdrasill in the *Edda* and which come out of the river Hæffing." A river of that name is nowhere mentioned in the *Eddas*. ii. 111: "In the *Edda* of Saemund it is said that the Alfes are accustomed to call the trees the beautiful arms. We already know the meaning of the boy with the golden hand." The allusion is to *Alvissmál* 29 (*álfar fagrlima*), where however *fagrlimi* means "with beautiful branches." ii. 148: "The three sons of the Finns go to inhabit the Valley of the Wolf. . . . On Christmas Eve the king Helgi meets with a witch who rides upon a wolf having eagles for bridles." For "of the Finns" read "of the King of the Finns" (*Völundarkv. Introd.*) and for "eagles" read "snakes" (*orma. Helgakv. Hiörvardss.*, prose to v. 30). The same mistake recurs on p. 191, where we also find: "The beautiful warrior maiden, who coming forth from the battles, rides upon an eagle." Does Gubernatis mean to translate *Vingskornir* (*Fafnism. 44*) "an eagle"? it is generally supposed to be the name of a horse. ii. 390: "In the *Eddas*, too, the serpent Lokis, who has taken the form of a horse, betrays himself by his feet." Loki nowhere appears as a serpent, though he once takes the form of a horse (*Gylfag. 42*).

These examples will suffice so far as the *Edda* is concerned, but elsewhere too Gubernatis would have done well to be more exact in his quotations, and to have relied less upon second-hand sources (like *Aldovrandi*, &c.) When he refers to the *Vedas* he always gives chapter and verse with the greatest care, and we cannot tell why he does not follow the same course always. Of what possible use is a reference to Philostratus, Diodorus, Plutarch, Pollux, *Edda*, Du Cange, Cæsar Heisterbacensis, &c., &c.? they are worthless for controlling the text, and even in the works of the greatest scholars that precaution is not to be dispensed with; we have seen that it was necessary with Gubernatis himself in the *Eddas*, or, again, in the following passages. Vol. i., p. 196, he says: "The German wild huntress of Gueroryssa . . . is represented with a serpent's tail." This is wrong, for in Grimm *Deutsche Myth.*, p. 897, we find only: "At the head of the train rides Gurorysse or Reisarova with her long tail." That Grimm also was mistaken, and that the name of the female spectre was not *Gurorysse* but *Guro Rysserova*, I have shown in Bartsch's *Germania*, xvi. 215. Vol. i. 389: "In *Tzetzas* (*Tzetzes*) I find again the curious notion that Midas sold his own *stercus* out of avarice, that is that he changed it into gold." What *Tzetzes*, however, has, is that Midas "pinched his belly and sold the food so economized" (*Ἐστέον τὴν γαστέρα δὲ, τὰ βρώματα πιπράσκων*). ii. 27: "The name of Cyrus's nurse, according to Textor, was Küna." Who Textor is I am not aware; but in Herodotus i. 110 she is called *Κυνώ* (a translation of the Median *Σπακὺ τὴν γὰρ κύνα καλέουσι σπάκα Μηδοί*). ii. 32: "The dog in connection with a man's hand is mentioned in the Latin works of Petrarch, when speaking of Vespasian, who considered as a good omen the incident of a dog bringing a man's hand into the refectory." It would have been better to refer to Suet. Vesp. 5 instead of to Petrarch. ii. 69: "The mouse that passes over the yarn occurs again in German tradition: 'Gertrudenbuchlein ab: Zwei Mäuschen nagen an einer flachsumwundenen Spindel; eine Spinnerin sitzt am St. Gertrudentag, noch in der Zeit der Zwölften, wo die Geister in Gestalt von Mäusen erscheinen, darf gesponnen

werden.' Rochholtz, ut supra i. 158." This is a mutilated, perfectly unintelligible quotation, which ought to run: "So bildet sie (die heilige Gertrud) der krainische Bauernkalender so wie das so genannte Gertrudenbuchlein ab: Zwei Mäuslein nagen an einer flachsumwundenen Spindel; eine Spinnerin sitzt am Spinnrade und eine Maus läuft den Faden hinauf. Weder am St. Gertrudentag, noch in der Zeit der Zwölften," &c. ii. l. c. "It is well known how in the Hellenic fable the council of mice resolve, to deliver themselves from the cat, to put a bell round its neck," &c. This fable does not occur in any Greek fabulist or other writer: vide Oesterley on Pauli's *Schimff und Ernst*, cap. 36; and on Kirchhof's *Wendunmuth*, 7, 105. The Scotch story of Archibald Douglas, nicknamed Bell the Cat, is familiar to every one. ii. 80: "In the twenty-first Esthonian story a silly husband is called by the name of Hare's-foot." Gubernatis has misunderstood this phrase; for in German *Hasenfuss* (hare's foot) means a coward, and in the story referred to somebody says to a henpecked husband: "You are a coward (*Hasenfuss*) and don't know how to manage a woman." ii. 153: "The lion is the steed of the hero Hildebrand." Gubernatis has again misunderstood the passage referred to (in W. Grimm's *Heldensage*); Lion (*Loewe, Lewe*) is the name of Hildebrand's steed. ii. 161: "The tiger Mantikora, which has in its tail hairs which are darts thrown by it to defend itself, and are spoken of by Ktesias, in Pausanias." For "Pausanias" read "Phot. Bibl., p. 45b Bekker," where however stings (*κέντρα*), not hairs, are mentioned. ii. 178: "Whilst *ave*; that is to say good augury, was still the solemn formula of Roman salutation, the Greeks had already turned auguries and auspices into derision." Here Gubernatis has confused the greeting *ave* (imper. of the verb *avere*) with the expression *bona ave* (*εὐορπνις*). ii. 211: "The lady cow of the English has several names in Germany, . . . among others we find those of . . . little cow of women, and little cock of women. German maidens, in fact, in Upland send it to their lovers as a messenger of love, with the following verses," &c. Instead of "little cow" and "little cock of women" it ought to be "little lady cow" (*Frauenkühe, Marienküchchen*) and "our lady's chick" (*unser lieben Frauen Küchlein*). Upland, moreover, is not a German but a Swedish province. Mannhardt (*Germ. Mythen*, p. 252) gives the Swedish text of the song as well as the German translation. ii. 275: "The lark with the crest or with the tuft explains the custom of the Gauls, recorded by Suetonius in the Life of Julius Cæsar, of representing a crested cock upon their helmets." Suetonius (c. 24) has: "Ad legiones, quas a republica acceperat, alias privato sumtu addidit: unam etiam ex Transalpinis conscriptam, vocabulo quoque Gallico: Alauda enim appellabatur." Here mention is made of the name of a single Roman legion, not of a custom of the Gauls. ii. 385: "It is as a witch that the lizard is killed, in the Greek myth, by Appolines (read Apollo), whence its name of Sauroktanos (read Sauroktonos)." Where did Gubernatis find such a Greek myth? *Sauroktonos* is a name of Apollo, but not of the lizard.

These are the errors and defects which have struck me in reading the present work, and I have instanced them in detail partly to justify the strictures above pronounced, and partly to show that I have gone through the book with the greatest attention. I have therefore the better right to speak to its valuable sides, and can testify to the wide reading which Gubernatis displays in his references and illustrations, and to the remarkable number of conceptions referring to the animal world which he shows either had or may have had a mythological origin—often only to be explained by

the most ancient Indian sources. Many of his views, including some of great acuteness, will doubtless receive further confirmation, if they have not done so already, as is the case with what he says i. 257: "From what we have said thus far, it seems to me that two essential particulars have been made clear—1st, That the worship of the bull and cow was widely spread *even in northern nations*," &c. His proof of this, which is mostly theoretical, has received striking confirmation from facts given in Holmboe's treatise *Om Civaisme i Europa* (in Vid. Selskabets Forhandling for 1866, pp. 188-220, Christiania). Even when Gubernatis is mistaken (as we have seen he himself admits was likely to be the case sometimes) his errors will give occasion to further research, and so assist the discovery of the truth. The materials which he has collected are most valuable in their abundance and would have been still more ample but for the restrictions which, as has been said, he imposed on himself. For this reason I refrain from additional remarks of my own on various passages which might have suggested these, and will only instance one or two points in passing. Gubernatis says (i. 48) "A cow (probably a black one), often a black goat, was sometimes also sacrificed in the funeral ceremonies of the Hindoos, as if to augur that, just as the black cow, night, produces the milky humours of the aurora, or is fruitful, so will he who has passed through the kingdom of darkness rise again in the world of light." Without inquiring whether Gubernatis' explanation of the reason why black cows were sacrificed at the funerals of the ancient Hindoos is the correct one, the fact itself is firmly established—vide Mannhardt, *German. Mythen*, p. 734. In Westphalia it is believed that there will be a death in the house of anyone who slaughters a black cow or ox—a superstition which probably arose from the custom of doing so when a death had occurred. (The same writer in *Zeitschrift für Deutsche Mythol.* iv. 420.) This too gives the best explanation of the English superstition mentioned in *Choice Notes from Notes and Queries*, p. 20, and of the Scotch phrase "The black ox has trampled on him," which means, if I am not mistaken, "He (or one of his family) is dead." In German one says of an unlucky person: "The black cow has crushed him," or "The black ox has trampled on him;" amongst the Bohemians and Magyars: "The black cow has trod on his heels." The Kalmuck tale of Siddhi-kür (in Zülz's *Mongol. Märch.*, p. 1. "Die Knotennase"), referred to by Gubernatis (i. 131), tells of the rich and avaricious man whose poor brother goes in despair into the forest to die upon a rock. He is enriched in an unexpected manner, and is envied by the other brother, who goes to the same place in hopes of experiencing the same good fortune, but as he does not hide himself the hobgoblins see him, and believing him to be the man who stole the hammer and the sack, avenge themselves upon him by lengthening his nose and covering it with protuberances. It is interesting to meet with this story again not only in Italy (Vittorio Imbriani's *Novellaja Fiorentina*, Napoli, 1871, No. 14, "I due Gobbi"), but also in Japan (Mitford's *Old Japan*, i. 276, "The Elves and the envious Neighbour"). Gubernatis also (i. 391) takes the following notice from the curious volume *Laus Asini*, printed at Leyden by Elzevir: "Si quis graviter a scorpione ictus id in aurem insusurret asino, ex tempore curetur." Elliot (*Races of the N. W. Provinces of India*, i. 260) likewise mentions this European superstition, and adds, "In India it is also believed that if a person is bitten by a scorpion, he may be cured by the following ceremony:—A young male buffalo calf is selected, in preference to a donkey, as being a purer animal, and into its ear is whispered the following incantation (which probably has no meaning at all, at least only faint glimmerings of sense can be detected in it). . . .

When this jargon has been duly uttered by the messenger, he returns to the bitten patient, and is sure to find him duly recovered." It is not less remarkable that in a Russian tale (Gubern. i. 408) Thereshicha says that he was originally the stump of a tree which his father and mother, being childless, had picked up in the forest and wrapped up and rocked in a cradle till he was born. This corresponds to a passage in the Finnish epic *Kalevala* (Schiefner's translation, p. 131), where an unfortunate maiden wishes she had never been born, and uses the expressions that follow: "Would that thou, poor mother, that bore and suckled me, hadst given away thy milk and swathed a log and washed a little stone instead of washing thy daughter and wrapping up thy darling to come to such fulness of sorrow," &c. We find here an echo of the widely spread custom of supplying the place of a lost or wished-for child by a doll or a gourd, on which cf. Tylor's *Early History of Mankind*, second ed., p. 110. Hence perhaps may be explained the Hindoo idea, according to which all children come out of the globular gourd (Rochholtz, *Glaube und Brauch*, &c., i. 135) and the Wallachian story (Schott, No. 23) of Trandafir, who is a man by day and a gourd by night. The story of the tail-fisher to which Gubernatis alludes (ii. 113), saying, "In a popular Norwegian story the fox makes the bear catch fish with his tail, which is frozen in the water," is likewise to be met with in numerous countries: Tylor l. c. p. 364. Shortly before (ii. 112) Gubernatis mentions a Russian tale in which the peasant cheats his companion the bear twice: when they sow turnips together the peasant reserves for himself whatever grows underground, and leaves to the bear whatever comes out of the earth; when they sow wheat, the bear, thinking to be very knowing, takes for his own part what grows under, and gives to the peasant what grows above the ground. The peasant is about to be devoured by the bear, when the fox comes to the rescue. This tale, like the preceding one, is also met with in Norway (Asbjørnsen, *Ny Samling*, Christiania, 1871, No. 74, 3) and in Germany (Grimm, No. 189), where the devil is the person cheated. To Grimm's references (vol. iii.) may be added a Caucasian tale (*Magazin für die Litter. des Auslands*, 1834, No. 134) where also the devil takes the place of the bear; and the old Spanish *Conde Lucanar*, c. 41, where instead of the devil vice (el mal) appears and is cheated by virtue (el bien) about the division of a field of turnips. The author of *Conde Lucanar* is known to have derived a considerable portion of his collection of tales from Arabic sources, and thus it happens that we find the incident in question in one of Rückert's poems (p. 75) from a similar source. Another Russian tale (Gubern. ii. 357), in which the crab beats the fox in a race by a trick, recurs in various forms in ancient Greece (*Æsop*, ed. Koraës, No. 287, "Χελώνη καὶ Λαγωός"), in Armenia (Vartan, No. 8), in Arabia (Lokman, No. 20), in Siam (Bastian in Benfey's *Orient and Occid.* iii. 497), and in Ceylon (Steele's *Kusa Fatakaya*, p. 257). But I will not forestall the additions which Gubernatis will doubtless make to his work in a second edition. The examples already given will show sufficiently the copiousness of the materials offered in the *Zoological Mythology*, which enlarge the horizon of mythology and general folklore in every direction, and are of interest even for the general reader; so that Gubernatis has put both the learned and the literary classes in his debt—a debt materially augmented by the excellent index which accompanies his work. FELIX LIEBRECHT.

The Intellectual Life. Hamerton. Macmillan and Co. 1873.  
It is difficult to give an adequate description of a book whose value consists less in its substance than in its spirit;

good conversation is refreshing and stimulating, and yet it is often puzzling to say what it comes to. Mr. Hamerton's book is like the best conversation: we feel when we are reading that we are breathing a clearer air, which is bracing without being keen; we feel that he throws light upon topics about which few of us find it comes natural to think quietly and coherently. For most of us the plan of our lives consists of as many of the corollaries of two or three absolute (and incompatible) theories as we can find room for between the prejudices which experience has happened to leave to us and the inferences from our organization and our circumstances which experience has forced upon us. Anybody who can help us to see where we are going, and make deliberate progress through such a chaos, does us an essential service, and this is exactly what Mr. Hamerton does for us. Our feverish agitations subside in the presence of such unflinching patient cheerfulness, such ready recognition of limits, such adroit perception of issues; it is impossible to be carried away by phrases when we are protected by such an alert instinct for delicate precision of statement, such transparent candour, and by the exquisite refinement of temperance which we are inclined to think the greatest merit an essayist like Mr. Hamerton can possess. The only guarantee against some degree of triviality is to repress the temptation to make earnestness and emphasis do instead of originality until it ceases to be felt; and an author who can practise such self-denial is rewarded by a perennial flow of the observations that are too accurate to be obvious and of disinterested distinctions and of well-chosen illustration.

The book consists of letters never sent through the post to correspondents who are not imaginary, dealing with such topics as the Physical and Moral Basis of the Intellectual Life, Intellectual Hygienics, Education, the Power of Time, Custom and Tradition, Aristocracy and Democracy, and the like. There are more than seventy letters, so it is obviously impossible to give the description of these correspondents, who will now receive so many letters besides those intended specially for them, though the situations which Mr. Hamerton chooses to discuss are always suggestive, and give the discussion an air of actuality which it never loses. The subject in hand is examined with an attentive ingenuity which makes sure of every landmark which can guide the inquirer, who always is carried safely up to the point of not being perplexed by the subject, and often, though this is less important, up to the point of understanding it; for what we really want in most cases for practical guidance is not to see very far into a matter, but to see our way well out of it. For instance, the hints on forming and keeping to habits which suit the individual, in the letter to a student in uncertain health, are much more indisputably true and come much nearer to exhausting the subject than the reply "to a moralist who had said that there was a want of moral fibre in the intellectual, especially in poets and artists;" yet for practical purposes enough has been said when it has been shown that literary and artistic work requires moral courage and as much purity as is implied in self-control. It would have been superfluous to have tried to make a better case for the moralist than he had made for himself by pointing out that morality has other factors besides strenuous self-control. If a man has cultivated his intellect successfully that is a strong presumption that his self-control is decidedly above the average; it is no presumption at all that his sense of obligation is stronger, nor again that his ideal instincts find their indulgence rather in reverence than in self-complacency. As a matter of experience it might be plausibly maintained that intellectual men are prone to emancipate themselves from the duties which practical men acknowledge; it would not be paradoxical to suspect that it

is only very high knowledge indeed which tends to encourage reverence or aspiration after what is unattainable here, and that it only produces this effect upon minds of a peculiar quality. But without insisting upon these doubtful points it was possible to preach a perfectly candid sermon on the benefits of discipline and the necessity of drudgery. This characteristic candour is most conspicuous in the beautiful letters to a student in the first ardour of intellectual ambition, to an intellectual man who desired an outlet for his energies, and to a friend of a man of high culture who produced nothing. After the rapturous motto on the title page from Giordano Bruno in praise of philosophy, "*Pro qua incurrisse non piget labores, dolores, exilium, quia laborando profeci, exulando didici, quia inveni in brevi labore diuturnam requiem, in levi dolore immensum gaudium, in angusto exilio patriam amplissimam,*" it is startling to come upon admissions that ennui is the common fate of intellectual workers and that hard work is no specific against it, that many highly cultivated minds are naturally and incurably sterile, and that it is very much a matter of accident whether a cultivated mind which is not sterile finds any outlet for its energies except what the author felicitously describes as intellectual charities. Here again we note the tact with which the writer keeps the discussion to what can be acted on. He has not allowed himself to be tempted into the obvious generalizations that our desires are normally in excess of our faculties, that we are naturally capable of much more than it is physically possible that we should actually achieve, and that, limited as our available powers are, they are in excess of our opportunities, especially of the opportunities which attract us. If he had been tempted the book would have been depressing, and the fatal question,—

"Were it not better done as others use—  
To sport with Amaryllis in the shade,  
Or with the tangles of Neocera's hair?"

would have intruded itself importunately, for Mr. Hamerton is not in a position to silence it with reference to fame or even "the perfect witness of all-judging Jove." Nor is his own answer that faculties torment us when they exist and are not exercised entirely adequate; there is a very wide margin between the point at which a faculty is impaired by disease or becomes clamorous for employment and that at which it performs the most it can. But there is no necessity for raising questions which are unanswerable, and Mr. Hamerton's book raises the reader into an atmosphere where they seem otiose.

Readers who do not need or do not relish teaching which is as elevated as it can be without being transcendental will find much to interest them in the chapters on education, especially in the details which the author's experience suggests as to the limits and possibilities of polyglot culture. He tells an amusing story of a son of his own who learnt and unlearned Gaelic, English, and Provençal. We are inclined to think too much stress is laid upon the case of a French student of English literature who read Claribel as follows:—

"At ev ze bittle bommess  
Azvart ze zeket lon  
At none ze veeld be ommees  
Aboot ze most edston  
At meedneeg ze mon commess  
An lokez down alon  
Ere songg ze lins veet svelleveets  
Ze clirvoicvire—ed mavi dvelless  
Ze fledgling srost lissess  
Ze slombroos vad ootvelless  
Ze babblang ronnel creessess  
Ze olov grot repleness  
Vere Claribel lovlee—ess."

This is intended to prove the worthlessness of modern classical scholarship, and certainly it does awaken uncom-

fortable suspicions that our taste may be as much at sea as our pronunciation certainly is. But it is to be remembered that classical scholars are not so isolated like the French student; they support and control each other; our appreciation of ancient literature and ancient poetry does not differ as widely from ancient criticism and ancient feeling as his appreciation of English authors and English poets did; even our pronunciation, absurd as it is, has a fixity and refinement which we may hope is not without a definite and not very remote relation to the music of Cicero and Virgil. The author is on surer ground in the letter to a friend who recommended him to learn this thing and that, where he inculcates by many charming analogies from cookery and other sources the important though neglected truth "that the mere addition of knowledge may be good for us or bad for us; and that whether it will be good or bad is usually a more obscure problem than the enthusiasm of educators will allow." This is all the more remarkable because the writer has no preference for specialists—indeed his natural predilections seem to lie rather in the other direction; his favourites are models of universal attainment like Humboldt and Goethe, or universal accomplishment like Julian Fane. The letters on women and marriage are full of delicate and beautiful observations: perhaps the best where all are good is a suggestion that married people should renew themselves for each other as an author renews himself for his public. The letter to a friend who seemed to take credit to himself, intellectually, from the nature of his religious belief is upon the whole the best of those on custom and tradition. The main position of it is that such self-complacency is misplaced whatever its ground, since the intellectual life is open to Sandemanians, Ultramontanes, and Atheists. This makes it more remarkable that other letters are pervaded by an assumption that for those who lead it the intellectual life is supreme. The assumption may seem to be self-evident; but in fact we see that the various activities of the man of business and of the muscular Christian, and even of the moral enthusiast, upon the whole confine themselves spontaneously within the elastic limits of general consent. Even the intellectual life itself has not been less intense at periods when it accepted these limits than it is now when it rejects them: Aristotle would have been as startled as Aquinas at the paradoxes of the modern advocates of truth at any price. G. A. SIMCOX.

#### LITERARY NOTES.

In the *Contemporary Review* (June 1) Mr. Herbert Spencer continues his papers on "The Study of Sociology:" the twelfth is devoted to "the theological bias" as a disturbing force in the development of a natural social morality. "Red Cotton Night-cap Country," by A. Orr, is an intelligent and sympathetic analysis of Mr. Browning's work: the reviewer's object is to interpret rather than to criticise, but the poet's frequent need of an interpreter is ingeniously accounted for; Mr. Browning aims at saying and thinking at length what most people are content dimly to see or feel, and as what is addressed to the intelligence can only be apprehended thereby, his audience is limited to those who are able to follow very original conceptions. In the same number Mr. Goldwin Smith answers "Mr. Greg on Culpable Luxury" with more urbanity and not less point than usual, pleading guilty to a *penchant* for the ethics of Christianity, and representing that moral responsibility may coexist with a scientific view of the laws of wealth.

The *Cornhill* has a lively and instructive paper on "The French (periodical) Press, from its foundation to the death of Mazarin." It would be curious to know whether Renaudot, the founder of the *Gazette de France*, who "not only inaugurated in France an Estate, Professional and Servants' Agency, as well as an office for private sales and exchanges, but further laid the basis of the Posté Restante, Parcels Delivery, Post-office Directory, Tourist's Guide and Money Order Office;

besides affording an outlet to troubled spirits like those who correspond through the agony column of the *Times*"—was at all indebted for the idea of these modern inventions to the father of Montaigne, who had divined the power of advertisement a century earlier. In the same number are some charmingly Heinesque lines on "New Rome," by Mr. Matthew Arnold.

The (American) *Catholic World* for May offers a new explanation of the epithet "young Abraham Cupid," used by Mercurio, and turned into "Adam" by most commentators except Mr. Dyce, who finding the same word in other passages plainly used as the name of a colour, wishes to read "auburn" wherever it occurs. The writer argues that "Abraham-men" in *Lear* is a term for impostors as well as a colour; that "Abraham's balm" is one name for the "kind of withy or willow commonly called *agnus castus* in England, the hemp tree." Wigs were made of flax and hemp, and to some extent from the similar coloured fibres of the "Abraham's balm" tree, and used by rogues for disguise, and by a somewhat forced ingenuity it is proposed to understand by "young Abraham Cupid" a tow-wigged or yellow headed young impostor.

The "Co-education" question, or rather the expediency of admitting women to Harvard College, is being discussed with some animation in Boston. Those opposed to the innovation state that at Oberlin and in most Western colleges it has been found that men and girls do not really follow the same course of study when they have the opportunity, from which it would seem to follow that Harvard might oblige the agitators without danger by simply insisting on strict conformity to the present college course from all students indiscriminately.

The *Journal des Débats* has recently published some letters of Mirabeau's which give curious confirmation to the little credited statements of Etienne Dumont in his "Souvenirs" to the effect that he himself and three of his countrymen (Genevèse, Reybaz, Clavière and Duroveray, had a large share in the composition of Mirabeau's most famous speeches. The letters are from Mirabeau to Reybaz, very confidential in tone, and actually apologizing for slight changes made in delivery or printing from Reybaz's manuscript.

The *Athenæum* (May 31) mentions dubiously the authorship of "An analysis of the influence of natural religion on the temporal happiness of mankind, by Philip Beauchamp." We believe that there is no doubt that the pamphlet, originally published in 1822, and reprinted for private circulation in 1866, was by the late Mr. Grote. Originality was scarcely to be looked for in so juvenile a production, but Godwin's views are put forward in it with much cleverness and ironical moderation. "Natural religion" is defined, of course quite arbitrarily, as a belief in an Omnipotent Being who will administer posthumous pains and pleasures to mankind. Belief in a future life does not by itself, the writer proceeds to argue, afford a directive rule of conduct. Attempts to infer such rule from the character of the Deity, of which nothing is known but that he is omnipotent and incomprehensible, lead, as the unknown is always terrible, to his being conceived as a capricious despot and addressed with servile praise. Pious works are not identical or coextensive with those prescribed by utility, or the motive for their performance would subsist independently of religion. Duty towards God is avowedly out of relation to the good of other men, and if it affects our happiness it must do so by diminishing it, since otherwise legislation on the subject would have been unnecessary. Threats of future punishment do not enlighten the judgment as to what is good, and human legislation can punish overt evil acts, while an hypocritical zeal for God's service ends in intolerance and other passions detrimental to the general interest. The utilitarianism, it will be seen, is decidedly crude, and the author did not succeed in weakening the claim of religion to respect on his own principles as giving a cheap sanction to positive police regulations.

The "Poésies inédites de Lamartine," just published, include some early attempts at tragedy, the plan of the great religious epic, of which *Jocelyn* and *La Chute d'un ange* were only intended to be episodes, and a fragment *Le Chevalier*, which is in the poet's best descriptive style.

## Art and Archaeology.

**Early Christian Numismatics, and other Antiquarian Tracts.** C. W. King, M.A. London: Bell and Daldy. 1873.

MR. KING has been long in the field as an authority on ancient gem engraving. His popularity among lovers of this branch of art has been earned by several works of which we are free to confess that they display a very extensive knowledge of his subject. Of the two elements, however, required for thorough work in this direction of research, an intimate acquaintance with classical writers and a familiarity with modern discoveries and criticisms bearing upon ancient monuments of all kinds, it strikes us that Mr. King is decidedly superior in the former at the cost of the latter.

These remarks may not appear to be pertinent to a book labelled *Early Christian Numismatics*. But to our regret the book in question is not what its outside professes to be. For it contains, out of 302 pages in all, the following chapters which can neither be described as Christian nor numismatical: (1) "On an intaglio representing the clepsydra used at races in the Circus Maximus," p. 113-122; (2) "Signet of Q. Cornelius Lupus," p. 123-149; (3) "Seal set with an intaglio of the Laocoon," p. 151-171; (4) "The gem-portraits of Commodus and Marcia," p. 265-274; (5) "On an antique paste cameo, found at Stanwix, near Carlisle," p. 275-286. Of the other chapters some are Christian and some numismatical. The first (p. 1-93) alone combines both features, and probably for no other reason than its being first was chosen to supply the main title; the words "and other antiquarian tracts," which are added on the title-page, are not calculated to produce the impression that they apply to by far the greater part of the book.

A better opportunity could hardly be desired of airing an acquaintance with recent criticism in matters of ancient art, than in treating of the intaglio (p. 151-171), which appears to be an ancient copy of the well-known marble group of Laocoon. With regard to the marble group, a difference of opinion as to its date arose between Winckelmann and Lessing, the latter believing it to have been made in the time of Titus, and the former being convinced that it was the work of artists of the Rhodian school at a much earlier period. These opinions being based on a perfectly ambiguous passage of Pliny and for the rest on individual taste, it is not surprising that the supporters of the one never seem to succeed in shaking the faith of their opponents and that our principal authorities are still ranged with pretty equal strength under one or the other opinion. Winckelmann has been followed by O. Müller, Welcker, and latterly Brunn and Overbeck, while on Lessing's side have appeared Visconti, Thiersch, Braun, Stephani, and more recently Friederichs and Bötticher. If he had counted the supporters of the two theories from their published opinions on the subject, Mr. King could not, we think, have obtained a just foundation for his remark that "the majority of critics at present" refer the Laocoon group to a much earlier period than that of Titus, "perhaps to the school of Lysippus."

Mr. King may be right in his theory of this group having been originally intended to decorate the pediment of a temple of Apollo, though owing to some confusion in the process his argument appears to lead only to this that bronze could not well have been employed for such a purpose. "The group of the Laocoon would be with equal propriety chosen to fill the tympanum of a temple of Phoebus as that of Niobe and her children, teaching another moral, to decorate one consecrated to his goddess sister." As far as the moral lesson is concerned, certainly. But surely a repulsive subject like that of the Laocoon ought never to be compared on any other grounds with that of the Niobides. The sight of

physical pain may have been regarded with less horror than we suppose by the Greeks, but neither "the frequency with which the death of Opheltes by the bite of a snake is reproduced on gems," nor the statue, apparently of Philoctetes, by Pythagoras of Rhegium, *claudicantem cujus ulceris dolorem sentire etiam spectantes videntur*, nor even the poor representations of Prometheus which occasionally occur, are sufficient to convince us that a nation in whose legends the destruction of monsters by favourite heroes plays so important a part could have ever encouraged the execution of sculptures like the Laocoon group, which could only be fully appreciated by tastes fostered at gladiatorial displays. "Curves and spirals," it is true, "had a special charm for the Grecian eye," and it is not denied that the curves and spirals of the group in question are of a Greek character; for it is expressly stated to have been executed jointly by three artists of unmistakably Greek names. But it is contended on the other hand that these artists lived at a time when the true spirit of Greek art had departed, and that, therefore, the cruel subject in which their love of spirals and curves is displayed need not be reckoned among the subjects more or less familiar to the Greek masters of the earlier time when Greece was independent and its great artists all competitors for the applause only of the best of their countrymen.

The representation of the Laocoon which Mr. King now publishes occurs on the private seal of Thomas Colyns, Prior of Tywardreth from A.D. 1507 to 1539, and differs from the marble group as it now stands in the action of the right hand of the father, besides in some minor details. "He appears on the wax attempting with his right arm *bent* to tear away the head of the serpent from his throat into which it has already fastened its fangs, whilst at the same time he vainly averts his face from its attack. Now in the marble the action is totally different: Laocoon *extends* the same arm at full length and forces away from him merely a fold of the serpent's body, the head of which appears much lower down. . . . But the discrepancy is easily explained. This portion of the marble was wanting upon its discovery and was immediately restored—by M. Angelo as the story, of course, goes—consistently with his own false conception of the original attitude. Nevertheless a small projection is still visible on the head of Laocoon sufficient to have guided a more sagacious restorer to a better understanding of his duty, by suggesting the former adhesion of the serpent's bite in that particular place." This discrepancy assures Mr. King that the gem had been copied previous to the restoration of the marble, that is, previous to the Italian revival, and, as there was no time between the Italian revival and the date of the execution of the marble in which the gem could well have been copied, it is highly probable that both works are nearly contemporary.

ALEXANDER S. MURRAY.

### THE FRENCH PLAYS.—MADEMOISELLE DESCLÉE.

THE enterprise of Messrs. Valnay and Pitron, exercised in the face of many vexatious restraints, has enabled us all within the last month to see Mademoiselle Desclée in two or three great characters. No lady within living memory has sprung more suddenly into the front rank of actresses, and no one has relied more absolutely upon laborious art for the attainment of success with that public of the Gymnase Theatre which is fortunately as critical as it is large. In London, her first appearance was in the character of *Frou-Frou*, in the play of that name. Those who saw her in it from the beginning to the end, probably came away with the conviction that they had seen a great actress—an artist of sufficient sweep of intellect to conceive of a character as a whole from the written drama, and to work out that conception in detail, instead of trying to build up out of details an

effective and surprising *ensemble*. In seeing Mlle. Desclée on the stage you do distinctly each time see a new character; but the bias and temperament of the actress naturally determine the amount of success with which each character is presented, and I am not sure that so powerful an impression is produced by her *Frou-Frou* as by her much shorter performance in *Une Visite de Noces*—a piece which has not been acted at all in London. For the *Visite de Noces* calls for the display of qualities in which Mlle. Desclée is strongest; and calls exclusively for these. *Frou-Frou*, on the other hand, demands some gifts which are not in the possession of this accomplished actress—demands in the first act a romping girl's brightness and lightsomeness, and in the last a quite peculiar gentleness of pathos. Thus, the last act would have been better played by Miss Kate Terry, and has actually been better played—or at all events more touchingly—in the opinion of fine judges, by Mlle. Léonide Leblanc. And the first act would gain quite as distinctly by the sparkling freshness and mutinous humour of a younger comédienne—Miss Nellie Bromley. But then between these two there are three acts which seem the especial property of Mlle. Desclée; and in these her exhibition now of restless impatience—gradually growing irritation—now of a calm and satisfied sense of mastery, now of scorn, now of passionate upbraiding, and now of vehement appeal, is of course absolutely unrivalled. What I may perhaps be permitted to speak of as the comparative failure of the final act is due, not wholly, but in part, to an over-use of that monotonous utterance of which Mlle. Desclée was the first to discover the value. Remarkable effects, especially in the expression of a scorn that is much restrained, may be produced by this monotonous utterance. Word falls after word with the persistency and equality of thunder-drops at the beginning of a storm. The face is Sphinx-like. No power is proved, but any amount is indicated. But this strange method fails of its effect in a death-scene, like that of *Frou-Frou*; which (laudably free as it is from all common faults of exaggeration and want of self-control) would be rendered infinitely more touching by one happily found change either of face or voice. It seems ungrateful to say this—and to be at pains to say it—when one easily remembers so very much that is admirable in the performance; but the truth is that Mlle. Desclée's artistic gifts and acquirements are so incontestable and so many that one is in some danger of forgetting that among them must not be reckoned the want of flexibility in gentleness,—of graduation in pathos.

A good deal might be said if this were the place in which to discuss the literary merit or moral teaching of *Les Idées de Mme. Aubray*, and of *Diane de Lys*—works of the early and of the middle period of the present Dumas's career; but of Mlle. Desclée's performance in these plays there is little to be said, apart from that which is said already, unless one begins to particularize with a criticism of detail, useless now that it is all over. But to see her in two or three parts—whatever parts these be—confirms the impression that Mlle. Desclée is one of the very few actresses with artistic instinct and cultivation to think out a character definitely before beginning to embody it, and then so to embody it that not the cleverness of this or that individual touch—the inspiration of this or that great moment—shall remain with you, but rather the life-likeness of the whole. But as one specimen of really great acting, it is fair to mention the extraordinary outburst of moral elevation and happy relief with which Diane welcomes what is unexpectedly good in the thought and expression of her associates; and as another one may call attention to the subtlety and suggestiveness of every look, gesture, and tone when Diane tells Paul Aubry that her husband has returned, and that his return is nothing whatever to her. There have been actresses with greater, or at all events more pleasing, means than Mlle. Desclée, but no actress with the like means has produced a greater result.

FREDERICK WEDMORE.

#### NOTES ON ART.

The *Gazette des Beaux-Arts* for June contains: 1. a long article on the *Salon* by M. Georges Lafenestre illustrated by several inferior woodcuts. The sculpture of the *Salon* receives more attention from M. Lafenestre than does that generally of our Royal Academy exhibition from the critics, and three out

of the five illustrations are devoted to it. 2. "Antique beds" considered especially as a form of sepulchre, by M. L. Henzey, is continued and finished. Among the illustrations is a curious Etruscan urn in the form of a festal bed on which the deceased is depicted taking part in his own funeral banquet. This curious custom prevailed it would seem with several nations. A jolly-looking king of Assyria is represented lying on his bed-tomb and partaking of refreshment with his wife who sits on a chair by his side. 3. "Léopold Robert d'après sa correspondance inédite." This is the fifth article on the subject by M. Charles Clément. 4. The Brussels exhibition is reviewed by M. René Menard. A good etching by Courty of "The Smoker" by Terburg, another by Hedouin of "La Jeune Fille à la Rose" by Goya, and a third by Greux of a White Horse by Wouverman are given as illustrations. 5. In "Paradoxes," second article by M. Edmond Bonaffe, "Le Comfort" is attacked as not being a French and therefore not a desirable thing. 6. "L'Oeuvre d'Eugène Delacroix" is an appreciative article by M. Louis Gonse. 7. "Bibliographie des ouvrages publiés en France et à l'étranger sur les Beaux-Arts et la Curiosité pendant le premier semestre de l'année 1873," by M. Paul Chéron, of the *Bibliothèque Nationale*.

The *Zeitschrift für bildende Kunst* is principally remarkable this month for its frontispiece—a masterly etching by W. Unger of one of Rembrandt's portraits (called that of "the Bürgermeister Six") in the Cassel Gallery. This was published some time ago in Unger's *Galerie zu Cassel*. It had then a somewhat warmer tone, but the reproduction is very good. An article entitled "Streifzüge im Elsass" by Dr. Alfred Woltman gives an interesting description of the street and church architecture of some of the old towns in Alsace. Several illustrations of rich Gothic buildings are given in it. A fourth article on the collection of Sir Richard Wallace in the Bethnal Green Museum by G. Gutenberg, criticising especially the works of Rubens and his school; a second article on the activity in building—*Bauthätigkeit*—now manifested in Vienna, and an article on Niccolò Alunno and the school of Foligno, complete the number.

A sale of a large and good collection of modern paintings chiefly of the English school, belonging to the late Mr. John Hargreaves, of Broad Oak, took place last week at Messrs. Christie, Manson, & Wood's rooms. Landseer's "Pensioners," Frith's "Pope making love to Lady Mary Wortley Montague," "Gathering the Offerings" by John Philip, "Christ in the Garden of Gethsemane" by the elder Linnell, and many other paintings by English artists of equal note were sold.

Great discontent has prevailed among French artists this year on account of the limitation of the space usually allotted to them in the Palais des Champs-Élysées. Living artists have been obliged to make room for dead ones, in pursuance of the Government scheme of the Musée des Copies. This has been manifestly hard on a large number of artists who have every right to exhibit in the Salon, and whose chance of selling their works depends perhaps on their so doing, but who on account of want of room have this year found themselves excluded.

Some reparation has, however, been offered to these offended artists by a spacious room having been allotted to them, capable of holding 800 pictures, situated behind the Palais des Champs-Élysées. The painters at once formed a commission to examine the pictures claiming admission, and the exhibition is by this time open.

The total sum realised by the sale by Messrs. Christie, Manson, and Woods of the drawings of David Cox that had remained in the possession of his son was £25,324.

In spite of the limitation of space, and consequently excluded artists, the catalogue of the Salon enumerates 2,142 exhibited works. This is 541 more than in our Academy. There are 1,556 exhibitors, divided into 1,064 painters, 309 sculptors, 41 architects, and 142 engravers and lithographers. Of these women artists amount to 168, and artists of various foreign nations to 163.

A reduced replica of the great picture of Sardanapalus by Delacroix, now exhibiting at the Society of French Artists in Bond-street, was bought by M. Prosper Crabbe at the Wilson sale for 70,000 francs.

According to the *Messenger du Midi*, a Montpellier paper quoted in the *Moniteur des Arts*, an important and interesting autograph of Molière has just been discovered among the archives of Montpellier. This is almost as great a literary event in France as the discovery of a Shakespeare autograph would be with us. The smallest line, or even a signature, by the great author of *Le Misanthrope* is extremely rare.

The directors of the Cologne Museum have brought out of their dépôt a picture which had hitherto been looked upon as valueless. It was in a bad state from neglect and dirt, and was considered as an all but worthless work by an unknown hand. The Pellenkofer process was however applied, and the picture, a Pietà, was then discovered to be an interesting work of Abraham Janssens (1567-1631).

At the sale of the pictures of the Marquis de la Rocheb... which took place a short time since in Paris a painting of Weymouth Bay by Constable was bought by an Englishman, Mr. J. Wilson, for 56,000 francs. The French Government, it is said, bid up to 50,000 francs for this picture, and it is now asserted that Mr. Wilson, "in a fit of generous remorse," intends presenting his acquisition to the Louvre. It is time certainly, as even Frenchmen are beginning to think, that the English school should be represented in the National Museum of France. Hitherto a small painting by Bonington, who may almost be reckoned as belonging to the French school, and two reputed Gainsboroughs, have been the only works by English artists in the Louvre.

If, however, as is said, Mr. Wilson will not only give the "Bay of Weymouth," but likewise a sketch of Salisbury Cathedral by the same artist, to the Louvre, that collection will be suddenly enriched by three Constables, for the Director, not knowing probably of Mr. Wilson's generous intention, purchased another work by Constable—"The Cottage"—at the same sale for 24,000 francs. Almost all the English pictures in the Rocheb... collection sold well. A portrait by Reynolds, however, of Sir George Yonge, which had been previously engraved in the *Gazette des Beaux-Arts*, only fetched the small sum of 6,000 francs.

The celebrated Hüsken collection of Albrecht Dürer's engravings and woodcuts has recently been acquired by the Vienna Academy of Fine Arts. This collection, which was originally formed by Herr Hüsken with a view to writing his *Catalogue Raisonné* of Dürer's engravings that was published in 1778, contains some very perfect impressions of the finest of Dürer's prints; especially a St. Jerome and a Little Cardinal are mentioned as extremely choice examples. There are as many as 160 wood engravings, and two or three of the scientific treatises, as well as the copper engravings. But besides these there is another treasure that goes with the Hüsken collection—a veritable lock of the great German artist's hair, whose history can be traced almost up to the time when it was cut off the head of the dead master. It originally belonged to one of Dürer's pupils, but has been transmitted through various hands until it finally came, with the Hüsken collection, into the possession of a painter of Frankfort, who has sold it with the rest to the Vienna Academy.

The June number of the *Portfolio* is enriched by a fine and large etching by M. W. Ridley of a London dock scene—"The Orange Wharf, London Bridge." In some respects this etching resembles those of similar scenes in Gustave Doré's "London," but it has none of the glamour that the French artist delights to throw over his representations of ordinary life. It is quite real. An etching called "The Ballad," by J. D. Watson, is a wonderful piece of work for a first attempt, as we are told it is, of the artist. Sidney Colvin continues his appreciative criticism of painters "From Rigaud to Reynolds."

A lithograph of Sir Joshua's "Cornelia" (Lady Cockburn and her children) illustrates his text.

Adolf Tidemand, of Düsseldorf, is exhibiting a large painting of a Norwegian wedding procession. The bridal party on their way home from church are obliged to cross a mountain stream. The bride and bridegroom, who are on horseback, are enabled to do this with tolerable dignity, but the rest of the merry party take off their shoes and stockings and prepare in various fashions to wade the stream. The landscape in which the scene is set is very effective.

Mr. Charles Critchett, formerly assistant secretary of the Society of Arts, is a candidate for the secretaryship of the Royal Academy, now vacant.

### Science.

*Genera Plantarum* ad Exemplaria imprimis in herbariis Kewensibus servata definita; auctoribus G. Bentham et J. D. Hooker. Vol. II., pars I. London : L. Reeve and Co. ; Williams and Norgate. 1873.

THIS large instalment (pp. 534) of the second volume of the *Genera Plantarum* follows as promptly as could be expected upon the first, considering the great amount of work which both authors have upon their hands, the needless trouble and worry which one of them has had to endure in guarding the interests of the noble establishment under his charge, and considering also that the new part comprises—in fact mainly consists of—two such vast natural orders as the *Rubiaceae* and the *Compositae*. There remain no orders so large and, with one possible exception, none so difficult. We may now hope, and fairly expect, to see the work go on to completion at such a rate that it may actually represent the botany (or rather the Phanerogamous botany) of this generation, the end being reached before the earlier portions need recasting—a precious advantage, which in so large an enterprise and in these days of plenteous harvest and few labourers cannot often be secured.

It is safe to say that there are no other two living botanists who combine so many qualifications for such an

undertaking as this—who have (collectively speaking) seen so much living vegetation under diverse climes, have scrutinized so many dried specimens, and dealt with so many of the practical problems of systematic botany. Certainly no such couple can be found, capable of working together to a harmonious result, whose conclusions would carry so high a probability of being well founded.

Complete uniformity of treatment by two hands is not to be expected. It is likely that if the *Rubiaceae* and the *Compositae* had been elaborated by the same author the number of the genera of the former would not have increased from about 240 (in Endlicher) to nearly 340, and those of the latter diminished below the sum of the last previous enumeration. Yet this is by no means certain. Some orders furnish more decisive characters for genera than others, and are less disposed to isolate them in single species. The ratio of genera of single known species to those with more than one seems to vary between one to 2 (*Saxifragaceae*), or one to 24 (*Cruciferae*) to one to 32, which holds for *Leguminosae* and *Compositae*. Those of *Rubiaceae* are intermediate, viz., one to 28. So that monotypic genera play a conspicuous part in the system of nature; and the adoption of very comprehensive views respecting the limitation of genera only moderately lessens their very notable proportion. One may be confident that in the *Compositae* and the *Leguminosae* of the present work such genera are reduced to their lowest practicable numbers.

In a work like this, which must immediately pass into the hands of all systematic botanists, there is no need to explain its plan and characteristics, nor even to state how any particular order is treated. Yet a word or two respecting two such important orders as *Rubiaceae* and *Compositae* may not be amiss. The former are disposed in three (instead of the ordinary two) series, a small middle one being intercalated for the convenient disposition of the few genera with geminate ovules; these series are divided into twenty-five tribes, the characters of which are mainly taken from the æstivation of the corolla, and the nature, number, and when solitary the direction, of the ovules. These characters had been tentatively tried before (first by Mr. Bentham), and they appear to answer the purpose well. In *Compositae* the principal reforms of the order as left by the elder De Candolle who gave the later years of his life to its study, are first, the omission of that convenient primary division into *Tubuliflorae*, *Labiatiflorae*, and *Liguliflorae*, the latter at least differing from the other tribes of *Compositae* so much more widely than they do from each other that one regrets the change. Second, the tribes—thus ranking as the most comprehensive divisions—are increased from eight to thirteen (notwithstanding the inevitable union of De Candolle's two Labiatiflorous tribes into one), and the tribal characters are most clearly and skilfully worked out, much use being made of the anther as well as of the style. The exclusion of the *Pectideae* from the *Vernoniaceae*, and of the *Tussilageneae* from the *Eupatoriaceae*, was of course to be looked for; the constitution of a large tribe, *Inuloidae*, under which are brought together the *Tarchonantheae* and the *Gnaphalineae* of De Candolle, is one of the greatest improvements. So is the separation of the *Calendulaceae* from the *Cynareae*. Thirdly, the genera, which were almost nine hundred in De Candolle's time, and must have much exceeded a thousand, notwithstanding many consolidations, are here repressed with a strong hand, being reduced to less than 800, including a considerable number of new ones. This is done upon clear and intelligible principles, applied by a judgment uncommonly well balanced, but seemingly inclined now and then to excess in the way of consolidation.

At least we have the impression that it is here and there rather overdone.

Finally, instead of expatiating upon the merits of the work, which are sure to be recognized, one may more usefully and not ungraciously point out some small slips or faults. One or two relating to the structure of the fruit in certain *Caprifoliaceae* are partially corrected in the Errata (as respects *Symphoricarpos*, but not in the more obvious case of *Triosteum*). Both would have been avoided, and the structure of the ovule more definitely stated if some early observations by Dr. Hooker upon the latter in this order had been kept in mind.

In *Rubiaceae*, the phrase “Flores quoad organa sexualia di-v. tri-morphi,” appended to the ordinal character, much too vaguely and insufficiently refers to the dimorphism in question to serve the whole purpose. If the differences in the length or insertion of stamens, and reciprocally in the length of the style, are not essential generic characters, they should be kept in view in the generic description, or else it may fail of its end. For instance, the character assigned to *Mitchella* is not true of any one individual in the genus. Whenever such individual has “stamina fauci corollae inserta; antherae exsertae,” it has not “ramis styli exsertis,” and so conversely. The same applies to *Houstonia*, *Anotis*, &c. It is not enough to say that the filaments may be short or rather long, included or exserted, unless it be stated that both occur in the same species, and that the style (of which no variation is mentioned) is reciprocally long or short. This state of things should also be kept in view in cases like that of *Heterophyllaea*, in which the exserted style and included anthers of the only known plant indicate the high probability of a counterpart to which the present generic character would not apply.

So also, but in a different way, the character of *Posoqueria* would be much improved by a statement that the anthers connive and are lightly united, that two of the filaments are strongly and two lightly curved, and all in such elastic tension that when a slight external force disturbs the nicely adjusted equilibrium of the anthers, and the force of the liberated filaments projects the pollen, the bowed filaments recurve while the straight one is inflexed and covers for a day or two the orifice of the corolla. These are no less matters of structure than important in the way of function.

As to *Pinckneya*, the brief erratum still leaves somewhat to be said, and its removal from the *Cinchoneae* may be challenged. The ovules it is true are horizontal or nearly so; and the seeds (which may well be termed “majuscula,” since they are commonly five lines long, and the pod only six or eight) are fixed by the edge. So they are in two or three recognized Cinchoneous genera, while at least in one (*Bikkia*) they are said to be horizontal. As to the wing no Cinchoneous seeds have this better developed.

The genus *Relbunium* would be very convenient, no doubt, by leaving two characters to distinguish *Galium* from *Rubia*; but some Californian species completely invalidate it. So, also, the separation of *Valerianella* from *Fedia* is very well in Europe, but in North America are some intermediate species which fairly forbid the separation.

It is doubtless intended that this second volume shall contain the remainder of the Gamopetalous orders. We may hope that botanists will not have very long to wait for its completion.

ASA GRAY.

### Notes on Scientific Work.

#### Anthropology.

Discoveries at Marsabotto.—The publication entitled *Méthodes pour l'histoire primitive et naturelle de l'homme*, 8 ann., 2 sér., 1872, p. 251,

gives some illustrations and a short account of a series of objects found in the ancient cemetery of Marzabotto, consisting principally of bronze mirrors, discs, fibulae, some of them of the Gaulic type and others resembling in form those found at Hallstatt, articles in gold, and bronze statuettes. Of the latter two types are to be distinguished, the first representing the human form with the meagreness and stiffness of a primitive art and yet with a considerable idea of sweetness in the expression of the face. The high pointed cap, *tutulus*, is sufficient proof that figures of this kind are the production of native Etruscan workmen. The second type, on the contrary, here represented by a group of Mars and Venus (fig. 21) and a statuette of a negro (fig. 22), is obviously the result of a close study of Greek models from the period just before the culmination of Greek sculpture. The shortness of the proportions and the roundness of the limbs both of Mars and the negro seem to suggest, from their resemblance in these respects to the sculptured metopes from the temple at Selinus in Sicily, that the Etruscans had caught the current of Greek influence brought by the Doric colonists to Sicily and the south of Italy. A group very similar to that of Mars and Venus is to be seen in the British Museum. Such figures were employed to surmount either candelabra or cistae, in the present case candelabra, as may be proved by the pedestals to which they are still attached. Among the other objects found were three fragments of pottery inscribed (1) *κακῶλυιον ἐποιεσεν*, (2) *Akios*, and (3) *Tjrum*, not *Murn*, which can only be obtained by reading the letters in a direction not only contrary to what is usual, but also contrary to the direction of the letter R, which is the only one of them that cannot be read either way. The tombs in which these objects were all found are of two kinds, the first being formed of four slabs or blocks of stone with a heavy cover either pointed and ribbed like a roof of a house, or flat and surmounted by a sort of pillar, while the second are in the shape of wells (fig. 28, 29) constructed of small pointed flints without cement, and varying in depth from 2 to 10 metres. The diameter of the mouth varies from 0.3 to 0.8 of a metre. The contents consist of three or more skeletons, a large urn, vases of clay and bronze rings, pieces of tiles and sometimes of painted vases, and bones of domesticated animals. Excepting two others found at Certosa tombs of this kind have not hitherto been discovered in Italy. In France, on the other hand, they frequently occur. A third class of tombs at Marzabotto are formed of chests made of large tiles with a cover and capable of holding skeletons entire.

**Costanti, the tattooed Suluote.**—It is much to be regretted that Costanti, after yielding so far as to go to Berlin for the purpose of being more closely examined by Virchow and Bastian, should have been overtaken at the last moment by an illness which he made the pretext of returning at once to Vienna. There is little doubt but that the real cause of his sudden departure was the dread of being subjected to a fresh examination as to the circumstances under which he was tattooed, a subject of which his previous accounts are in a high degree conflicting and unsatisfactory. Fortunately we have photographs of him as well as a detailed description in the *Wiener Medicinischen Wochenschrift*, 1872, No. 2, and an engraving on a large scale in Hebra's *Atlas der Hautkrankheiten*. From these it appears that the tattooing covers the entire body with the exception of the nose and such parts as the soles of the feet. The colours are mainly dark blue with an occasional touch of red, while the design, embracing figures of animals, flowers, weapons, and other objects with written characters in some places, particularly in the palm of the hand, is carefully carried out. The skin, instead of suffering in the process, is quite soft and delicate to the touch. Its feeling is unchanged, and in point of sensitiveness to temperature if anything increased. According to his account the instrument employed was a metal cylinder, pointed and split at the point like a pen, with a heavy metal handle. This cylinder being charged with coloured liquid was then placed against the skin, and resting on the left forefinger of the operator the point was driven with a steady movement under the skin. With three hours of this daily the whole work was completed in three months, and that it should have occupied so long a period is not to be wondered at when we consider the elaborate and truly artistic character of the design. All doubts as to the tattooing having been done in Burmah are now at an end through the assurance of Bastian that the letters which occur in it are Burmese. Costanti had called them Arabic. Though it is possible that he may have been subjected to the process as a proper punishment for a mercenary soldier captured in war, it is more likely that he had himself so carefully tattooed only for the ulterior object of gain. See *Zeitschrift für Ethnologie*, 1872, pt. vi. p. 201.

**Clay Vase from Alba Longa.**—Virchow having had brought to his notice one of those prehistoric vases of black clay which were found in 1817 under a layer of peperino at Alba Longa, now Marino, and of which the British Museum possesses several specimens, describes it in the *Zeitschrift für Ethnologie*, 1872, pt. vi. p. 221, as having been neither formed by the aid of a potter's wheel nor baked in a kiln. It is altogether without ornament, and in colour and appearance closely resembles the old Etruscan vases.

**The Amber of Bologna.**—Prof. Capellini has examined the ornaments of amber found in the ancient cemetery of Certosa, and is con-

vinced that the amber employed in these cases is precisely of the same nature as that still found in the neighbourhood of Bologna. He is therefore surprised that if, as he supposes, the amber of this district was used to a considerable extent in ancient times in the manufacture of personal ornaments and such like no mention should be made of it by writers like Strabo and Theophrastus who took pains to collect facts of this kind. The same, however, applies to the amber still found in the plain of Catania in Sicily, and yet there is no doubt of the latter having been extensively used by early artists in Italy. The Sicilian amber and that of the north of Italy are very like each other.

### Geography.

**Central Australia.**—Intelligence has reached England of a new journey to Central Australia which is perhaps the most important, as regards geographical results, of any that has been undertaken since Macdougall Stuart's march across the continent in 1861-62, and which quite subverts preconceived notions respecting the possibility of rendering that region permanently habitable.

The exploring party was despatched from Victoria by the exertions of Baron von Mueller. Mr. Ernest Giles, in company with Mr. Carmichael and an attendant, started from Chambers pillar, an almost central point of Australia on the line of the great overland telegraph, and explored the very heart of the continent for upwards of three hundred miles to the westward in various directions. The general features of the country were found to be the same as those observed by Stuart further to the east in the same latitude, scrub and sand-hills, alternating with grassy flats, mulga and oak trees often in abundance, ranges of hills with here and there creeks of fresh water. The animals of the district are wild ducks, pigeons, emus, and kangaroos. Occasional tribes of natives were likewise met with. Two important discoveries were made, first, the existence of a considerable mountain range of about 2,000 feet in relative elevation, or perhaps 4,000 feet above the sea level, extending westward in the line of the Mac Donnell Range discovered by Stuart; and secondly, of a great salt lake which forms a complete obstacle to further progress. The lake, as sketched in Mr. Giles' map terminating indefinitely to the westward, has a length of about 150 miles with an average width of ten miles, and must require a very considerable rainfall for its supply. In describing a flock of pelicans which he noticed, Mr. Giles remarks: "They came from the N.W., and indeed all the aquatic birds that I have seen on the wing come and go in that direction. Though there are plenty of small fish in the Finke, a creek followed on the journey, I do not think that they are large enough for mobs of pelicans to exist upon, for the largest I have seen was no bigger than a sardine; I should imagine that these birds had come from some larger waters in the tropics." The lake is named "Amadeus;" its waters are briny salt, and no fresh water whatever was to be found near its shores. Several specimens of old metamorphic rocks which probably indicate the presence of auriferous beds have been brought back; their existence in Central Australia was hitherto unknown.

Mr. Giles is about to start on a new journey to the south of Lake Amadeus, in the hope of penetrating still further into the unknown western interior.

### Chemistry.

**Pinacolin Alcohol.**—A new tertiary alcohol bearing this name has been prepared by Friedel and Silva (*Bull. Soc. Chim.*, 19, 193) by the action of sodium on pinacolin and distillation of the washed product. The greater portion passes over at 120°.5 and consists of a clear liquid possessing the smell of camphor. This is the new alcohol which is isomeric with hexylic alcohol; from the manner of its formation it is a dimethyl-isopropyl-carbinol. When cooled in ice it solidifies in crystals resembling those of carbolic acid. The iodide,  $C_8H_{13}I$ , is not very stable and when distilled with water breaks up into hexylene, boiling at 70°, and hydriodic acid. In its behaviour at low temperatures as well as in the characters of the iodide the new alcohol resembles trimethylcarbinol. The chloride, which boils at 112°.5—114°.5, is isomeric with the body obtained by Schorlemmer by the action of chlorine on diisopropyl, which however has a boiling point of 120°. Though in many features pinacolin alcohol resembles Wurtz's amylene hydrate it bears a temperature of 250° without undergoing decomposition. By treatment with potassium bichromate and sulphuric acid it is converted into pinacolin which boils at 106°. This is an important observation, for the belief has hitherto been held that a tertiary alcohol cannot yield on oxidation a product containing the same number of carbon atoms. By the oxidation of pinacolin the authors have obtained an acid which melts at 26°, possesses to a slight degree the odour of butyric acid, and has the composition of valerianic acid but which widely differs from that substance in boiling point and other properties. After the distillation mentioned above by which the alcohol was isolated the retort contained a small amount of a compound that crystallised on cooling and proved to be

a pinacone of pinacolin,  $2 C_6 H_{11} O + 2 H = C_{12} H_{22} O_2$ .—Berthelot proposes to arrange acids in three classes: 1. acids of simple function like acetic acid; 2. acids of complex function like lactic acid or salicylic acid; and 3. incomplete acids, to which the phenols as well as the alcohols belong. The acid of Friedel and Silva comes probably in the last category. These acids exhibit differences in the amount of heat which they develop during combination with an alkali. Acetic acid, when treated with soda, gives off 13300°, no matter how much the alkali is in excess. Lactic or salicylic acid with one equivalent of alkali evolves the same quantity of heat as acetic acid, but by the addition of a second equivalent of alkali a further, far smaller amount of heat is set free, it being in the case of salicylic acid about 3000°. By great dilution of the alkaline solution, however, the second evolution of heat is not observed. Phenol gives off about 7400° and alcohol causes no development of heat when the alkaline solution is very dilute.

**Artificial Formation of Fluor Spar.**—Scheerer and Drachsel have recently succeeded (*Jour. Prakt. Chem.*, 1873, No. 2, 63) in forming crystals of calcium fluoride. Some attempts to obtain them by fusing the fluoride with mixtures of the chlorides of calcium, potassium, and sodium were not attended with any great success; occasional octahedra were found, but cubes or combinations of cubes and octahedra on no occasion. By heating calcium silicofluoride in an aqueous solution of calcium chloride to 250° for 10 hours a great quantity of octahedra were produced, an edge on one of which measured 0.08 mm. An aqueous solution of calcium fluoride yielded no crystals on evaporation at ordinary temperatures; when however the fluoride is heated with water slightly acidulated with hydrochloric acid for several hours at 240° under a pressure of 32 atmospheres of steam well developed octahedra are formed in abundance. Barium fluoride crystallised from its aqueous solution in cubes 0.02 in length. This fluoride when digested with hydrochloric acid in the manner above described furnished prismatic crystals of a compound of barium fluoride and chloride; when nitric acid was used cubes accompanied by prisms were produced. The experiments of these observers go to show that a slow action, in conjunction with a low temperature, favours the formation of fluor spar in cubes, while rapid action at a high temperature causes the fluoride to crystallise in octahedra. Barium sulphate deposited from a solution of the chloride heated with an excess of sulphuric acid to the same high temperature formed crystals considerably larger than those obtained by precipitation in the ordinary manner. By the action of calcium sulphate on barium fluoride at a high temperature well defined crystals containing both acids and bases separate, and it was only by a long sustained heating that individual crystals of fluor spar and barium sulphate were recognised. The authors are of opinion that the "Baryto-fluate of Lime" of Smithson may after all prove to be a mineral species and not a mere mixture as many mineralogists assert.

**The Evolution of Oxygen by Plants.**—In a paper communicated to the Academy of Sciences of Vienna Prof. Boehm (*Ber. Deut. Chem. Gesell. Berlin*, 1873, 1008, 550) shows that the carbonic acid absorbed by plants is not, as has hitherto been supposed, taken up directly by the cells containing chlorophyll, but that the organs must first become covered with an atmosphere of carbonic acid in order to perform their respective function. Prof. Boehm has been led to this conclusion by the following facts: 1. Leaves of *Fuglans* dipped in water containing carbonic acid and exposed to sunlight give off but very little gas if the little bubbles of gas forming on them are removed immediately they make their appearance. 2. The evolution of gas ceases if the coefficient of absorption of water for carbonic acid be augmented either by a reduction of temperature or by pressure, although under these conditions gaseous carbonic acid is still decomposed. 3. The evolution of gas likewise ceases if the leaves before the experiment are injected with water and the conditions necessary for the formation of bubbles on their surface greatly limited. Injected leaves of land plants, on the other hand, continue to develop in an atmosphere containing carbonic acid a considerable amount of oxygen.

In some experiments on the decomposition of carbonic acid by green leaves of land plants in a mixture of carbonic acid and hydrogen he observed that the quantity of oxygen produced was always greater than the volume of carbonic acid taken up; in some cases the excess in volume equalled that of the leaf itself. To trace the origin of this excess of gas the air enclosed in the tissues of living plants called for examination. Contrary to expectation the amount of gas extracted from leaves and twigs proved to be enormous and consisted almost entirely of carbonic acid. Living tissues of land plants, in fact, when placed in an atmosphere free of oxygen commence at once to give off carbonic acid, which they continue to do as long as they are living, and in the case of green leaves at a temperature of 20° C this is about 48 hours. *Caderis paribus* the amount of gas disengaged varies greatly with the temperature. This phenomenon is in every way analogous to that observed in the yeast of beer especially as regards what is termed its spontaneous fermentation. Organisms shut off from free oxygen derive the force necessary for carrying on the vital processes from internal combustion (the "innere Verbrennung" of Adolf Meyer). If green leaves of land plants be placed in hydrogen the volume of the gas is but slightly in-

creased and on analysis it is found to contain some oxygen. Mere traces of that gas will enable plants containing chlorophyll to carry on their normal respiration in sunlight. Green leaves which have been placed in the dark for three or four hours at a temperature of 20° C in an atmosphere of hydrogen and then exposed will often evolve one or two cub. cent. of oxygen. If the time be prolonged to twelve or fifteen hours they produce carbonic acid only on exposure; they have lost the power of taking the oxygen required for their normal respiration out of carbonic acid. Atmospheric air in which leaves of *Fuglans* were exposed to sunlight underwent no change in volume or composition at 30°; when however the temperature was raised to 40° or lowered to 10° more carbonic acid was produced than was decomposed by the process of respiration.

**Chloral and Acetonitrile.**—Hübner and Schreiber some time since in a paper on the atomic weight of fumaric and maleic acid communicated the results of some preliminary experiments on the action of acetonitrile on chloral, and gave an incorrect formula to the crystalline substance, the product of the reaction. They have now ascertained that this body, which resembles the one obtained by Baeyer by the action of chloral on benzol and sulphuric acid, is produced in the following manner:

It is, therefore, the amide of a bibasic chlorinated acid. Hübner (*Chem. Centralblatt*, 1873, No. 13, 201) believes that the compound formed by Meyer and Dulk from acetic anhydride and chloral is an isodipic acid, the acid in fact related to this amide.

**The Basicity and Constitution of Periodic Acid.**—Thomsen has determined the basicity of this acid by the method which he employed in the case of other acids, by neutralization (*Ber. Deut. Chem. Gesell. Berlin*, 1873, No. 6, 2). A maximum evolution of heat was observed when two molecules of potash act on one of acid. The chief results given in his paper are as follow:—The molecule of periodic acid is represented by the formula  $H_4 I_9 O_9 \cdot 3 H_2 O$ ; it is tetrabasic and decatonic. The normal salts have the form  $R'_4 I_9 O_9 \cdot 3 H_2 O$  or  $R''_4 I_9 O_9 \cdot 3 H_2 O$ . The three molecules of water are not in close combination and may be removed wholly or in part by the application of heat. The heat of neutralization in the case of the normal potassium salt is  $4 \times 13300^\circ$ . There are three classes of basic salts and the following formulæ represent one normal salt of each series:  $Pb_2 I_9 O_9 \cdot 2 H_2 O$ ;  $Zn_2 I_9 O_9 \cdot H_2 O$ ; and  $Ba_2 I_9 O_9$ . Basic potassium and sodium salts do not apparently exist in the solid state or are readily decomposed by water. When acids act on the normal salts an acid salt of the formula  $R_2 I_9 O_9$  is obtained. This decomposition of the molecule is attended by a considerable absorption of heat, about 16000°, so that the two molecules of potash required for the formation of the acid salt develop only 10300° while the normal amount of heat is about 26000°.

Basarow, who has published a paper on the subject in the same part of the *Berichte*, does not agree with Thomsen in doubling the formula  $H_4 I_9 O_9$  and considers periodic acid to be a combination of iodine with one atom of oxygen and five hydroxyl which would give it the structural formula  $(HO)_5 I O$ . Of the five groups of hydroxyl two only play the part of acid hydroxyl, the remaining three of alcohol hydroxyl; and the acid therefore is pentatonic and dibasic. The following formula expresses according to Basarow's view the different functions of the hydroxyl groups:  $(HO)_2 I O (OH)_3$ .

**Metallic Phosphides.**—The compounds of phosphorus with zinc and cadmium have been studied by E. Renault (*Compt. rend.* 76, 283). By passing phosphorus vapour over zinc or the oxide of the metal at a red heat there is formed in addition to the compound already known,  $Zn_3 P_2$ , fine yellow, brown or red needles which by further heating become of a bright red colour and have the composition  $Zn P_2$ . It is but slightly attacked by acids. Cadmium under the same conditions forms two phosphides, one with a metallic lustre giving the formula  $Cd_2 P_2$ , the other consisting of carmine and often indigo-coloured crystalline plates of the compound  $Cd_3 P_2$ . Both substances are easily decomposed by acids and give off phosphuretted hydrogen, the latter body likewise forming hypophosphorous acid as well as a yellow product which contains phosphorus.

**Tridymite in Quartz.**—In the *Mitt. aus dem min. Museum der Univ. Prag* Dr. K. Vrbá announces the discovery of crystals of the new form of silica in a specimen of quartz the locality of which is unknown. They occur in characteristic groups of little six-sided tables on which he recognised in addition to the pinacoid and the prism planes a pyramidal face forming a truncation of them both.

**The Salt Beds of Stassfurt.**—C. Bischoff in the *Zeitschrift für ges. Naturwissenschaften, Halle*, Band 40, describes some recent borings made between Stassfurt and Schöneberg, which have been driven to a depth of 1,000 feet. During the operations a bed 54 feet in thickness and consisting for the most part of sylvine was struck.

Writing from Pau (*Chem. Centralblatt*, 1873, No. 13, 204) F. A. Hartsen sends a further contribution to the chemical history of plants. He has noticed how materially the seasons affect the amount of certain

complex chemical compounds which they secrete. In autumn he sought in vain for chrysophyll in *Ulmus* and *Mercurialis perennis* though they yielded a considerable amount during the spring. Chlorophyll also exhibits a change and readily undergoes decomposition in autumn, and this too before the leaves have begun to lose colour. *Isoflyrum thalicroides* when in blossom contains two alkaloids, one amorphous, the other crystalline. In autumn when the leaves have faded the root no longer produces a trace of the crystalline body while the amorphous alkaloid is in excess. He remarks that the fact of the yield of an alkaloid undergoing a qualitative as well as a quantitative change during the development of a plant is of great technical importance, especially in the case of plants which produce several alkaloids. It would be an interesting question to ascertain at which period of the year *Papaver Somniferum* contains most morphia and when most narceia and codeia.

Dr. Geinitz, the director of the Royal Mineralogical Museum in Dresden, has just published a small pamphlet describing the collection under his care and tracing its history from the time of Georg Agricola, when a *Museum für Kunst und Natur* was first founded in 1553, down to the present day. The present classification of the minerals was adopted in 1857 when the museum was committed to the charge of Prof. Geinitz. The specimens are arranged in two collections: one a general collection, the other "eine vaterländische Mineralien-Sammlung." In the former the non-metallic minerals are classified according to the acid, the metallic minerals according to the metal they contain, the whole being included in five great groups: geoliths, metals, metaloids, anthracoids, and haloliths. A short definition is given of the characters of each family and a slight history of the more remarkable specimens. The list of mineralogical and geological papers issued by the museum since 1836 is a long one.

The second volume of the *Centime Anniversaire de Fondation* (1772-1872) of the Royal Academy of Belgium, which has recently been issued, contains a very valuable "Rapport Séculaire" by M. de Koningck on the chemical researches which have appeared in the publications of the Academy during the century.

### History.

Debates in the House of Commons in 1825. Edited by S. R. Gardiner (Camden Society).

WHEN Charles I.'s first Parliament was summoned the King and the House of Commons appeared to be on the best of terms. When it was dissolved the great quarrel between them had fairly commenced. All historians have tried to investigate the reasons for this change, but hitherto we have not had the materials necessary to the inquiry. There is a large *lacuna* in the Journals, and the reports given are poor and scanty. Mr. Forster's Life of Sir John Eliot first made us acquainted with the debates, and now Mr. Gardiner prints a tolerably full summary of them from a MS. in the library of Sir Rainald Knightley at Fawsley. He has added an independent and even fuller report of the Oxford session from the Harleian MS. 5007, and some news letters; while the State Paper Office supplies a defence of the government, and a report from Pym on Montague's case. The key to the whole question is to be found in the parliamentary history of the previous year. The Commons, having regard to the limited resources of the nation, wished to limit the proposed war to an attack on Spain and Spanish commerce by sea, while giving some aid to the Dutch, and placing England and Ireland in a state of defence. In short, they were guided by what had been the policy of Elizabeth. But James I. and his son and Buckingham wished to form a great continental alliance to recover the Palatinate, and to throw the main weight of the war upon Germany. At last a compromise was made: the Commons' plan was adopted for the present, while the King was to mature his plan and lay it before Parliament in the autumn. Under Buckingham's guidance this engagement was broken; Parliament was not summoned in the autumn, the marriage of Charles with Henrietta Maria was arranged upon terms to which Charles had assured the Commons he would never submit, and arrangements were made for subsidising Mansfeld and the King of Denmark, and plans entertained for sending ships to attack Genoa and an army to besiege Dunkirk. This policy was far wilder than that which the Commons had rejected, as being beyond the means of the kingdom. When the fact of this fundamental difference between the King and the House antecedently to the opening of the session is once clear, all that followed is clear also. It was only bit by bit that all Charles' plans and subsidising became known, he having most unaccountably made no

general statement at all to the Parliament. There was no need for him to have gone to war when he found that the Commons would not vote the enormous sums required to carry out his plan, for war was not yet declared, and the Commons were for some time in doubt whether the war was meant by the King to be against Spain or against the Emperor. This fact is kept out of sight by Hume, who says, "when the war which they themselves had so earnestly solicited was at last commenced, the immediate desertion of their sovereign could not but seem very unaccountable." But the war was not yet declared, and it was not the war the Commons had wished when inflamed by Charles' and Buckingham's false narrative of what had taken place in Spain (Hume gently says "this narrative deserves great blame"), but a very different war, and one against a different sovereign. Mr. Gardiner has well brought out the essential opposition of view between the King and the Parliament. We trust that having now accumulated materials enough in his late publications he will give us the continuation of his History of James I., which he has impliedly promised us for some time. We note one small erratum. Should not *soe*, p. 182, line 8, be *noe*? C. W. BOASE.

**Storm's Critical Examination** into the Historical Writings of Snorre Sturlasson. [S. Sturlassons Historiekrivning. En kritisk Underøgelse af Gustav Storm.] Copenhagen: 1873.

In the spring of 1870 the Danish Royal Society (*det kongelige Danske Videnskabselskab*) propounded, as the subject of a prize essay, four critical questions concerning the character and origin of the great sagas attributed to Snorre, with a view to bringing out all attainable evidence with regard to the authorship of the *Heimskringla* and its value as an historical storehouse. Early in 1872 it was decided that the gold medal of the society should be awarded to Mr. Storm for the exhaustive and most learned treatise that now lies before us, and it is impossible to suppose that it could have been more thoroughly deserved. His investigations have been laborious and unflinching, and he presents us here with a digest of the whole, given in a style rarefied to the extreme of conciseness and terse almost to baldness. The work is not at all adapted to attract even the cultivated public, but to lay before scholars a clear and statistical view of what has been effected in the criticism of early Scandinavian history.

The first section of the treatise is occupied with the evidences that exist to show that Snorre wrote the *Heimskringla* in its present condition, and the author upholds his conviction of the inherent unity of that work in opposition to the contrary arguments of Professor Maurer. The second section is more elaborate and laboured. It consists of a patient consideration of the works of all the predecessors and followers of Snorre, and of the sources from whence he drew his information. The result of these exceedingly difficult investigations seems to be the certainty that already in Snorre's youth, and perhaps before, sagas had sprung up in the West, North, and East of Iceland; that Snorre knew at all events some of these, and that so they could influence his style; that many excellent writers were contemporaneous with Snorre, and that even after his time saga-writing was carried on in an historical spirit in the West and North; that in the next generation after Snorre there arose in the South Province a great writer, the author of the *Njálsaga*, who knew the previous literature from the other provinces; but that, lastly, soon after, in the close of the century, saga-writing began to be driven out by the influence of foreign romance, which brought historical sobriety into discredit, and introduced a legendary element into historical composition. The criticism of the various early historians is extremely full of interest.

The general reader is pleased to come, in the next division, to the personality of Snorre himself. A wonderful charm rests around the story of the first great modern author, with his wandering life, romantic fame, and tragical ending. Mr. Storm collects all the particulars of Snorre's early life and studies. Born in 1178, he came to Odde when he was only three years old to be brought up by the learned Jon Löftsson, who died while he was still a youth. It is more than probable that his education in Jon Löftsson's house was conducive to the development of poetical genius, the seeds of which seem to have existed in several members of the Sturlunge family. In 1212 he wrote a poem on Hákon Jarl, and when he was in Norway in 1218 he pronounced a series of verses before Skule Jarl, the burden of which, still preserved, proves him to have been even then a master-skald. Snorre's visit to Norway immensely quickened his literary powers; four years after, in 1222, he had finished his *Edda*. He was received in Norway as no Icclander had been before him, and this voyage turned his thoughts to the subject of his greatest work, the history of the Norse kings. In 1219 Snorre visited Sweden; sailing round the whole coast of Norway from Nidaros (Trondhjem) to Oslo (Christiania) he penetrated as far as Götaland. This Swedish journey doubtless influenced the writing of the *Ynglingasaga*, which was finished about 1219. Mr. Storm follows the life of Snorre no further than this point. He then dwells with much acumen on the peculiar excellencies of his author's historical manner, and points out that the great advance that Snorre made over his predecessors, the authors of *Morkinskinna* and *Fagrskinna*, consisted in this, that he gave not a series of biographies, but a continuous outline of the whole history of the Norwegian dynasties.

The remainder of the volume is occupied with more purely technical matters, such as the collation of MSS. No trouble has been spared to make the work exhaustive in itself and serviceable for students. The arrangement of the divisions and subdivisions of the criticism cannot be too highly praised, and there is a handy index. EDMUND W. GOSSE.

**Konunga Sögur.** Eller Sagaer om Sverri og hans efterfølgere udgivne af C. R. Unger, Christiania, 1870, 1871 (two fasciculi, to be continued).

THE lives of King Sverri and his grandson, King Hakon, are preserved in various MSS., some containing those sagas in full, some in a more or less abridged form. In this collection it is intended to print the chief vellums containing the best texts of the lives of these two kings. The beginning has now been made by publishing the abridgment contained in the Icelandic vellum, Eirspennil, or *Brasen-Clasp*,—thus called by Torfæus from its binding,—a vellum of the end of the thirteenth century, and now in the Arne-Magn. Collection, under No. 47 fol.; the first part of this MS. contains the lives of King Harold Hardradi and his successor, in a recension of the same family as the *Kringla*. The Eirspennil, or a transcript thereof, has thus also furnished the text to the third volume of the folio edition of *Heimskringla* of 1777 (see a former article); but here we are only concerned with the Sverri's saga and those of his successors.

King Sverri was a "new man." He was born in Norway, but came, five years old, to the Faroes, where he was brought up. The kingdom of Norway he won, sword in hand, with his Birk-banes. A warrior-king like Sverri had not been seen since the days of Harold the Fairhair. But besides all his battles and troubles he was well versed in tales and song and history. The Icelanders had a great liking for him, and refer to his judgment in historical matters; *eg.*, how Sverri used to speak highly of Olave Tryggvason's valour

at Swolder; how Sverri had been entertained by such and such story, and that he had said that this and this tale was not true, but that it was amusing. In Sverri's speeches and addresses to his soldiers we find almost the only allusions in ancient writers to ancient Eddaic songs, to popular legends (nursery tales such as in Grimm's Fairy Tales), and to popular lays. Hated by a large part of his own people as a usurper, and excommunicated by the Pope as an enemy of the Church, although in his youth he had himself received priestly ordination—he bethought himself of finding an historian of his own choice to write down his life. This man he sought and found not among Norsemen, but among Icelanders, in the abbot Karl, of Thingeyrar (died 1211); a sympathizing historian, a man after the king's own heart, for of this the saga bears witness everywhere. With this man the king sat closeted, told him his life, his dreams, and early deeds, dictated to him how to write and what to write. This appears to have been about the year 1186, and up to that date it is thought the saga was written down under the king's eyes, and partly from his own dictation. The latter part of the saga, up to the king's death in 1202, is somewhat briefer, but in word and in spirit it is kith and kin with the former, although here the historian had to write from other sources, unless, indeed, the king all along up to the end of his life communicated with his man in Iceland. The Sverri's Saga is remarkable among the old Icelandic Sagas, and unique from a philological point of view, being stocked with singular and, to an Icelander, unusual words and phrases, evidently due to the king's own inspiration and dictation; but as the transcribers were usually no respecters of such things, and often left out, or substituted common words for choice old words which were less intelligible to them, so it happens that no single perfectly good or authentic text is preserved in any "single" MS. The text of the Eirspennil, although merely an abridgment, is remarkably rich in those phrases; the compiler having evidently had lying before him a very excellent copy of the saga: various sentences and phrases are preserved only here, e.g., *Kasta klininginum ok könnunni*, answering to the English, "to throw the helve after the hatchet;" this and many other things, in the Oxford Dict. marked as Fms. viij., *v.l.*, are due to the text of Eirspennil.

After that saga follows a brief abridgment of the Lives of the kings between 1202-1216, which are also partly lost. We notice here only the curious story of the *Blacksmith and Odin*, p. 237. The last part of the Eirspennil is made up of an abridgment of Hakon's Saga, written by Sturla, the famous writer of the Sturlunga Saga and other historical works (born 1214, died 1284), but as the edition of that saga is not as yet finished, we reserve that to a future notice.

### Philology.

Διήγησις ὡραιότατη τοῦ θαυμαστοῦ ἀνδρὸς τοῦ λεγομένου Βελισαρίου, nach der Wiener Handschrift zum ersten Male herausgegeben von Wilhelm Wagner. Hamburg. 1873.

DR. W. WAGNER, who in 1870 edited the first part of a volume of *Medieval Greek Texts* for the Philological Society, has lately published at Hamburg the text of the poem of *Belisarius* from the hitherto inedited Vienna MS. The text by which this composition has up to this time been known is that of the Paris MS., and this has been published more than once, and, among other editors, by Dr. Wagner. The poem, as it appears there, is generally allowed to be the work of Georgillas, the author of the *Plague of Rhodes*, though in the preface to his present work Dr. Wagner gives up the view which, following Koraës and others, he maintained in his *Medieval Greek Texts* (p. 115), that Georgillas was also the author of the *Lament on Constantinople*. The principal interest attaching to the text now published arises from its being in reality another and earlier version of the same poem, which Georgillas must have had before him when he wrote his *Belisarius*, so that he rather expounded and amplified it than composed an original work. The earlier poem contains 556 lines as compared with the 840 of the later, and Dr. Wagner has drawn out in an interesting manner in his preface the contrast in political tendency between the two. The text has been edited with Dr. Wagner's usual care, and is accompanied by well-judged emendations. That this is not an easy task will be understood by anyone who has studied mediæval and modern Greek, since it requires much ingenuity and close acquaintance with the various branches of the literature to recognize words in the peculiar and sometimes perverted forms in which they appear; and this is rendered all the more difficult by the narrow area of literature from which we draw our knowledge of the vocabulary. The notes will be found especially valuable by students of modern Greek from the light they throw on the history and etymology of words.

H. F. TOZER.

A *T* conjugation, such as exists in Assyrian, shown to be a character of early Shemitic speech, by its vestiges found in the Hebrew, Phœnician, Aramaic, and Arabic languages. By Richard Cull. F.S.A. Extracted from the *Transactions of the Society of Biblical Archaeology*, vol. 2. London: 1873.

In his memoir on the *t* conjugation Dr. Cull claims to have made "the first announcement of the existence of *t* conju-

gations in Hebrew, Phœnician, and other Shemitic dialects, like those found in the Assyrian" (p. 24); it is difficult to see with what justice. By a *t* conjugation he means a secondary verbal form, produced by the insertion or prefixing of a *t*. Surely such elementary books as Gesenius' Hebrew and Wright's Arabic Grammar, to say nothing of others, have long testified to the existence of such forms in Semitic. "The fact is," says Dr. Cull, "that the profoundest Hebrew scholars, such men as Fürst (!), could not account for this *t* until the recovery of the long-lost Assyrian language enabled them to do so; and no Hebrew scholar appears to have applied this knowledge of the Assyrian to the elucidation of the Hebrew language" (p. 17). It would really almost seem as if Dr. Cull were unaware of the numerous illustrations of Hebrew contained in the Assyriological works of M. Oppert, Professor Schrader, and our countryman Mr. Sayce. There is indeed a reference to the last-mentioned scholar at the foot of page 20, but a strangely inaccurate one.

The paper as a whole is extremely disappointing. The intrusive *t* in all the instances mentioned has been often observed before, and in several of them explained on a principle, as it seems to me, identical with that of Dr. Cull. His sole merit, which I by no means wish to disparage, consists in having formulated this principle more distinctly and traced it to a peculiarity of early Semitic speech, though the way had been already pointed, so far as nouns with *t* prefixed are concerned, by Mr. Sayce in page 110 of his *Assyrian Grammar*. But was it necessary to imbed this very slight contribution to Semitic philology in twenty-nine printed pages, bristling with self-assertion, but derived partly from Fürst, partly from the material common to all students of Assyrian?—to raise the expectations of readers by promising an investigation into all the Semitic dialects, and to redeem the promise in so perfunctory a way? I am afraid, too, that Dr. Cull's readers will not be prepossessed in his favour by his blind idolatry of Fürst—a prophet, as it would seem, out of his own country. He twice misrepresents Gesenius (pp. 7, 9) by neglecting to consult the *Thesaurus*; at the foot of page 12 he falls out with Fürst through not having consulted Hupfeld on Psalm vi. 6; on page 25 he argues from a reading of Pænulus i. 8 which only exists in the imagination of Dr. Fürst; he is unaware (p. 10) of Schlottmann's able and thorough discussion of the etymology of עֲשֹׂרֶת (*Die Siegesssäule Mesa's*, p. 43), though that eminent Orientalist is wrong, where Dr. Cull is right, on the origin of the deity called Ashtoreth, which is properly non-Semitic. The pointing of the Hebrew is occasionally faulty; but I do not wish to accuse Dr. Cull of such a heinous offence.

T. K. CHEYNE.

#### THE AGE OF PATANJALI.

To the Editor of the ACADEMY.

SIR,—Allow me to say a few words with regard to Prof. Weber's remarks on my article on the age of Patanjali contained in his letter to you published in the number of the *Academy* for the 15th of March last.

The passage on which I base my conclusion that Patanjali was a contemporary of Pushpamitra is *not* the same as that pointed out by Prof. Weber twelve years ago. The latter occurs in Patanjali's comments on Pāṇini I-1-68, and is consequently in the first part of the first chapter, *i.e.* in that portion of the Mahābhāṣya which was printed at Benares under the superintendence of Dr. Ballantyne, to which alone Prof. Weber seems to have had access (see *Ind. Ant.*, vol. i., p. 244, note); while the former occurs in the comments on Pāṇini III-2-123, and is consequently in the second part of the third chapter. Prof. Weber's passage contains the word *Pushpamitra-Sabha*, "Court or assembly of Pushpamitra," and the only conclusions it warrants are that

Patanjali could not have lived before Pushpamitra and that this latter was a king. Whether he lived at the same time with Pushpamitra or after him the passage does not enable us to decide. And Prof. Weber himself does not go further in his deductions in his review of Dr. Goldstücker's Pāṇini (*Ind. Stud.*, vol. v.) So far is he from thinking that Patanjali was a contemporary of Pushpamitra, that he is of opinion that he lived about 25 A.D., *i.e.* nearly 170 years after Pushpamitra. On the other hand, the passage I have for the first time brought to notice contains the words *iha Pushpamitraṃ yājyāmah*, "Here we sacrifice for Pushpamitra," *i.e.* "as his priests we perform the sacrifice instituted by him." This is given as an instance of a rule laid down by Kātyāyana that the present tense should be used to denote an action that has begun but not ended. The action of sacrificing for Pushpamitra must have begun some time before Patanjali wrote the passage, and was in continuance and had not ended at the time he wrote it. For it is only when we understand the instance thus that it serves as an illustration of the rule. The conclusion therefore follows that Patanjali was Pushpamitra's contemporary. The details of the argument are given in my article in the *Antiquary*, and I have there quoted these two passages separately with references and given the different conclusions that follow from them as clearly as I could; but still Prof. Weber does not see that they are two distinct passages. I am at a loss to conceive how it could be so. I have recently brought to notice a third passage in the Mahābhāṣya in which Pushpamitra's sacrifices are spoken of (see *Ind. Ant.*, vol. ii., p. 69).
